5 Source: *Chapman University Residence Center Project Traffic Impact Study*, prepared by LLG Irvine (March 2007).

6 Source: Traffic counts/observations conducted at the existing recycling center in February 2014.

Table 5-2 presents the proposed Project's forecast peak hour and daily traffic volumes. Review of the upper portion of *Table 5-2* shows that the student growth component of the proposed project (i.e. net increase of 6,922 students) is forecast to generate 8,798 daily trips, with 865 trips forecast during the AM peak hour and 976 trips forecast during the PM peak hour. The student housing component of the proposed project (i.e. 818 beds) is forecast to generate 1,947 daily trips, with 58 trips forecast during the AM peak hour and 123 trips forecast during the PM peak hour.

Review of the middle portion of *Table 5-2* shows that the mixed use development component of the proposed project (i.e. 89,000 SF conference/education office space and 15,000 SF shopping center) is forecast to generate 2,763 daily trips, with 188 trips forecast during the AM peak hour and 284 trips forecast during the PM peak hour. Please note that the aforementioned trip generation includes adjustments for pass-by for trips that come directly from the everyday traffic stream on the adjoining streets (i.e. Fairview Road and Merrimac Way). The factors used in this report, which are summarized in the footnotes of *Table 5-2*, are based on information published in the *Trip Generation Handbook*, published by ITE (2014). Per the *Trip Generation Handbook*, a pass-by reduction factor of 34% is recommended for the PM peak hour for shopping center land uses. However, to provide a conservative analysis and remain consistent with City of Costa Mesa requirements, 10% was utilized for the PM peak hour. The daily pass-by percentage was estimated to be 10%, consistent with City of Costa Mesa requirements.

Review of the lower portion of *Table 5-2* shows that the recycling center expansion component of the proposed project is forecast to generate 988 net daily trips, with 20 net trips forecast during the AM peak hour and 120 net trips forecast during the PM peak hour. It should be noted that only the net project trips are evaluated because the recycling center is currently generating traffic and those existing trips are already accounted for in the existing traffic counts.

Overall, as shown at the bottom of *Table 5-2,* the proposed Project is forecast to generate approximately 14,496 daily trips, with 1,131 trips (936 inbound, 195 outbound) produced in the AM peak hour and 1,503 trips (731 inbound, 772 outbound) produced in the PM peak hour on a typical weekday.

5.2 Project Traffic Distribution and Assignment

Figures 5-1, 5-2, 5-3 and ***5-4*** present the traffic distribution patterns for the student growth project component, the student housing project component, the mixed-use development project component and the recycling center expansion project component, respectively. Project traffic volumes both entering and exiting the project site have been distributed and assigned to the adjacent street system based on the following considerations:

- the site's proximity to major traffic carriers (i.e. Harbor Boulevard, Fairview Road, I-405 Freeway, etc.),
- expected localized traffic flow patterns based on adjacent street channelization and presence of traffic signals,
- review of existing peak hour traffic volumes and
- ingress/egress availability at the project site.

TABLE 5-2
PROJECT TRAFFIC GENERATION FORECAST

Project Description	Daily 2-Way	AM Peak Hour Enter	AM Peak Hour Exit	AM Peak Hour Total	PM Peak Hour Enter	PM Peak Hour Exit	PM Peak Hour Total
Student Growth							
▪ Net Increase 6,922 Students	8,798	741	124	865	526	450	976
Student Housing							
▪ Student Housing – 818 Beds	1,947	33	25	58	49	74	123
Mixed Use Development							
▪ 89,000 SF Conference/Education Office Space	982	122	17	139	23	110	133
▪ 15,000 SF Shopping Center	1,979	30	19	49	81	87	168
Pass-By Reduction[7]	-198	--	--	--	-8	-9	-17
Subtotal	1,781	30	19	49	73	78	151
Total Mixed Use Development	***2,763***	***152***	***36***	***188***	***96***	***188***	***284***
Recycling Center Expansion							
▪ Existing Recycling Center Trip Generation	494	5	5	10	30	30	60
▪ With Proposed Expansion Project (3 Times Existing Trips)[8]	1,482	15	15	30	90	90	180
Total Net Recycling Center Expansion Trips (Proposed Minus Existing)	***988***	***10***	***10***	***20***	***60***	***60***	***120***
Total Trip Generation Potential	**14,496**	**936**	**195**	**1,131**	**731**	**772**	**1,503**

7 Pass-by trips are trips made as intermediate stops on the way from an origin to a primary trip destination. Pass-by trips are attracted from traffic passing the site on adjacent streets (i.e. Fairview Road and Merrimac Way), which contain direct access to the generator. Although the *Trip Generation Handbook* recommends a PM peak hour pass-by percentage of 34%, 10% was utilized for the PM peak hour consistent with City of Costa Mesa requirements and to provide a conservative analysis. The daily peak hour pass-by percentage was estimated to be 10%, consistent with City of Costa Mesa requirements.

8 At completion of the proposed recycling center expansion, it is expected that the site would collect triple the amount of waste that is currently collected at the existing facility, thus resulting in triple the amount of visitors to the expanded site.

The anticipated AM and PM peak hour project traffic volumes associated with the Project are presented in ***Figures 5-5*** and ***5-6***, respectively. The traffic volume assignments presented in *Figures 5-5* and *5-6* reflect the traffic distribution characteristics shown in *Figures 5-1, 5-2, 5-3* and *5-4* and the traffic generation forecast presented in *Table 5-2.*

5.3 Existing Plus Project Traffic Conditions

The existing plus project traffic conditions have been generated based upon existing conditions and the estimated project traffic. These forecast traffic conditions have been prepared pursuant to the California Environmental Quality Act (CEQA) guidelines, which require that the potential impacts of a Project be evaluated upon the circulation system as it currently exists. This traffic volume scenario and the related intersection capacity analyses will identify the roadway improvements necessary to mitigate the direct traffic impacts of the Project, if any.

Figures 5-7 and ***5-8*** present projected AM and PM peak hour traffic volumes at the thirty five (35) key study locations ("intersections") with the addition of the trips generated by the proposed Project to existing traffic volumes, respectively.

6.0 FUTURE TRAFFIC CONDITIONS

6.1 Ambient Traffic Growth

Horizon year, background traffic growth estimates have been calculated using an ambient traffic growth factor. The ambient traffic growth factor is intended to include unknown and future cumulative projects in the study area, as well as account for regular growth in traffic volumes due to the development of projects outside the study area. The future growth in traffic volumes has been calculated at one percent (1.0%) per year.

6.2 Cumulative Projects Traffic Characteristics

In order to make a realistic estimate of future on-street conditions prior to implementation of the proposed Project, the status of other known development projects (cumulative projects) has been researched at the City of Costa Mesa and the City of Newport Beach. With this information, the potential impact of the proposed Project can be evaluated within the context of the cumulative impact of all ongoing development. Based on our research, there are seven (7) cumulative projects in the City of Costa Mesa and one (1) cumulative project in the City of Newport Beach that have either been built, but not yet fully occupied, or are being processed for approval. These eight (8) cumulative projects have been included as part of the cumulative background setting.

Table 6-1 provides the location and a brief description for each of the eight (8) cumulative projects. ***Figure 6-1*** graphically illustrates the location of the cumulative projects. These cumulative projects are expected to generate vehicular traffic, which may affect the operating conditions of the key study intersections.

Table 6-2 presents the resultant trip generation for the eight (8) cumulative projects. As shown in *Table 6-2*, the eight (8) cumulative projects are forecast to generate a combined total of 6,578 daily trips, with 418 trips (167 inbound and 251 outbound) forecast during the AM peak hour and 607 trips (289 inbound and 318 outbound) forecast during the PM peak hour.

The AM and PM peak hour traffic volumes associated with the eight (8) cumulative projects in the Year 2024 are presented in ***Figures 6-2*** and ***6-3***, respectively.

6.3 Year 2024 Cumulative Traffic Volumes

Figures 6-4 and ***6-5*** present the Year 2024 AM and PM peak hour cumulative traffic volumes at the key study intersections, respectively. Please note that the cumulative traffic volumes represent the accumulation of existing traffic, ambient growth traffic and cumulative projects traffic.

Figures 6-6 and ***6-7*** illustrate the Year 2024 forecast AM and PM peak hour traffic volumes with the inclusion of the trips generated by the proposed Project, respectively.

7.0 Traffic Impact Analysis Methodology

The relative impact of the proposed Project during the AM peak hour and PM peak hour was evaluated based on analysis of future operating conditions at the thirty five (35) key study intersections, without, then with, the proposed Project. The previously discussed capacity analysis procedures were utilized to investigate the future volume-to-capacity relationships and service level characteristics at each study intersection. The significance of the potential impacts of the Project at each key intersection was then evaluated using the following traffic impact criteria.

7.1 Impact Criteria and Thresholds

Impacts to local and regional transportation systems are considered significant if:

- An unacceptable peak hour Level of Service (LOS) (i.e. LOS E or F) at any of the key intersections is projected. The City of Costa Mesa considers LOS D (ICU = 0.801 - 0.900) to be the minimum acceptable LOS for all intersections. For the City of Costa Mesa, the current LOS, if worse than LOS D (i.e. LOS E or F), should also be maintained; and

- The project increases traffic demand at the study intersection by 1% of capacity (ICU increase ≥ 0.010), causing or worsening LOS E or F (ICU > 0.901).

7.2 Traffic Impact Analysis Scenarios

The following scenarios are those for which volume/capacity calculations have been performed at the thirty five (35) key study intersections for existing plus project and Year 2024 traffic conditions:

A. Existing Traffic Conditions;
B. Existing Plus Project Traffic Conditions;
C. Scenario (B) with Improvements, if necessary;
D. Year 2024 Cumulative Traffic Conditions,
E. Year 2024 Cumulative Plus Project Traffic Conditions; and
F. Scenario (E) with Improvements, if necessary.

8.0 Peak Hour Intersection Capacity Analysis

8.1 Existing Plus Project Analysis

Table 8-1 summarizes the peak hour Level of Service results at the thirty five (35) key study intersections for existing plus project traffic conditions. The first column (1) of ICU/LOS values and HCM/LOS values in *Table 8-1* presents a summary of existing AM and PM peak hour traffic conditions (which were also presented in *Table 3-3*). The second column (2) lists existing plus project traffic conditions. The third column (3) shows the increase in ICU value and/or HCM value due to the added peak hour Project trips and indicates whether the traffic associated with the Project will have a significant impact based on the LOS standards and significant impact criteria defined in this report.

8.1.1 *Existing Plus Project Traffic Conditions*

Review of Columns 2 and 3 of *Table 8-1* indicates that traffic associated with the proposed Project ***<u>will not</u>*** significantly impact any of the thirty five (35) key study intersections, when compared to the LOS standards and significant impact criteria specified in this report. The thirty five (35) key study intersections currently operate and are forecast to continue to operate at an acceptable service level during the AM and PM peak hours with the addition of Project generated traffic to existing traffic.

Appendix B presents the existing plus project ICU/LOS and HCM/LOS calculations for the thirty five (35) key study intersections.

8.2 Year 2024 Traffic Conditions

Table 8-2 summarizes the peak hour Level of Service results at the thirty five (35) key study intersections for the Year 2024 horizon year. The first column (1) of ICU/LOS and HCM/LOS values in *Table 8-2* presents a summary of existing AM and PM peak hour traffic conditions (which were also presented in *Table 3-3*). The second column (2) lists projected cumulative traffic conditions (existing plus ambient plus cumulative projects traffic) based on existing intersection geometry, but without any traffic generated from the proposed Project. The third column (3) presents forecast Year 2024 traffic conditions with the addition of Project traffic. The fourth column (4) shows the increase in ICU value and/or HCM value due to the added peak hour Project trips and indicates whether the traffic associated with the Project will have a significant impact based on the LOS standards and significant impact criteria defined in this report. The fifth column (5) indicates the anticipated level of service with planned and/or recommended improvements.

8.2.1 *Year 2024 Cumulative Traffic Conditions*

An analysis of future (Year 2024) cumulative traffic conditions indicates that the addition of ambient traffic growth and cumulative projects traffic will not adversely impact any of the key study intersections. The key study intersections are forecast to continue to operate at acceptable levels of service during the AM and PM peak hours with the addition of ambient traffic growth and cumulative projects traffic.

8.2.2 *Year 2024 Cumulative Plus Project Conditions*

Review of Columns 3 and 4 of *Table 8-2* indicates that traffic associated with the proposed Project ***will not*** significantly impact any of the thirty five (35) key study intersections, when compared to the LOS standards and significant impact criteria specified in this report. Although the intersection of Harbor Boulevard at Victoria Street is forecast to operate at unacceptable LOS E during the PM peak hour with the addition of project traffic, the proposed Project is expected to add less than 0.010 to the ICU value. The remaining thirty four key study intersections are forecast to continue to operate at an acceptable service level during the AM and PM peak hours with the addition of Project generated traffic to existing traffic, ambient growth traffic and cumulative projects traffic.

Appendix B also presents the Year 2024 plus project ICU/LOS and HCM/LOS calculations for the thirty five (35) key study intersections.

9.0 STATE OF CALIFORNIA (CALTRANS) METHODOLOGY

In conformance with the current Caltrans *Guide for the Preparation of Traffic Impact Studies*, existing and projected AM and PM peak hour operating conditions at the six (6) state-controlled study intersections within the study area have been evaluated using the *Highway Capacity Manual 2000* (HCM 2000 for signalized intersections) operations method of analysis. These state-controlled locations include the following six of the thirty five study intersections:

7. Fairview Road at I-405 NB Ramps
8. Fairview Road at I-405 SB Ramps
28. Harbor Boulevard at I-405 NB Ramps
29. Harbor Boulevard at I-405 SB Ramps
33. Newport Boulevard/SR-55 SB Ramps at Fair Drive
34. Newport Blvd/SR-55 NB Ramps at Fair Drive/Del Mar Ave

Caltrans "endeavors to maintain a target LOS at the transition between LOS "C" and LOS "D" on State highway facilities"; it does not require that LOS "D" (shall) be maintained. However, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. For this analysis, LOS D is the target level of service standard and will be utilized to assess the project impacts at the state-controlled study intersections.

9.1 Highway Capacity Manual (HCM) Method of Analysis (Signalized Intersections)

Based on the HCM operations method of analysis, level of service for signalized intersections is defined in terms of control delay, which is a measure of driver discomfort, frustration, fuel consumption, and lost travel time. The delay experienced by a motorist is made up of a number of factors that relate to control, geometries, traffic, and incidents. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during ideal conditions: in the absence of traffic control, in the absence of geometric delay, in the absence of any incidents, and when there are no other vehicles on the road.

In Chapter 16 of the HCM, only the portion of total delay attributed to the control facility is quantified. This delay is called *control delay.* Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. In contrast, in previous versions of the HCM (1994 and earlier), delay included only stopped delay.

Specifically, LOS criteria for traffic signals are stated in terms of the average control delay per vehicle. The six qualitative categories of Level of Service that have been defined along with the corresponding HCM control delay value range for signalized intersections are shown in ***Table 9-1***.

9.2 Existing Plus Project Traffic Conditions

Table 9-2 summarizes the existing plus project peak hour HCM level of service results at the six (6) state-controlled study intersections within the study area. The first column (1) of HCM/LOS values in *Table 9-2* presents a summary of existing traffic conditions. The second column (2) presents existing plus project traffic conditions. The third column (3) indicates whether the traffic associated with the Project will have a significant impact based on the LOS standards defined in this report.

TABLE 9-1

LEVEL OF SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS (HCM METHODOLOGY)[13]

Level of Service (LOS)	Control Delay Per Vehicle (seconds/vehicle)	Level of Service Description
A	≤ 10.0	This level of service occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.
B	> 10.0 and ≤ 20.0	This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of average delay.
C	> 20.0 and ≤ 35.0	Average traffic delays. These higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.
D	> 35.0 and ≤ 55.0	Long traffic delays At level D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high *v/c* ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	> 55.0 and ≤ 80.0	Very long traffic delays This level is considered by many agencies (i.e. SANBAG) to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high *v/c* ratios. Individual cycle failures are frequent occurrences.
F	≥ 80.0	Severe congestion This level, considered to be unacceptable to most drivers, often occurs with over saturation, that is, when arrival flow rates exceed the capacity of the intersection. It may also occur at high *v/c* ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing factors to such delay levels.

13 Source: *Highway Capacity Manual 2000*, Chapter 16 (Signalized Intersections).

9.2.1 *Existing Traffic Conditions*

Review of Column 1 of *Table 9-2* indicates that the six (6) state-controlled study intersections currently operate at acceptable LOS D or better during the AM and PM peak hours.

9.2.2 *Existing Plus Project Traffic Conditions*

Review of Columns 2 and 3 of *Table 9-2* indicates that traffic associated with the proposed Project ***will not*** significantly impact any of the six (6) state-controlled study intersections, when compared to the LOS standards specified in this report. The six (6) state-controlled study intersections are forecast to continue to operate at acceptable LOS D or better with the addition of Project generated traffic to existing traffic.

9.3 Year 2024 Traffic Conditions

Table 9-3 summarizes the Year 2024 peak hour HCM level of service results at the six (6) state-controlled study intersections within the study area. The first column (1) of HCM/LOS values in *Table 9-3* presents a summary of existing traffic conditions. The second column (2) presents Year 2024 cumulative traffic conditions based on existing intersection geometry, but without any project generated traffic. The third column (3) presents future forecast traffic conditions with the addition of Project traffic. Column four (4) indicates whether the traffic associated with the Project will have a significant impact based on the LOS standards defined in this report.

9.3.1 *Year 2024 Cumulative Traffic Conditions*

An analysis of future (Year 2024) cumulative traffic conditions indicates that the addition of ambient traffic growth and cumulative projects traffic *will not* adversely impact any of the six (6) state-controlled study intersections. The six (6) state-controlled study intersections are forecast to operate at acceptable LOS D or better during the AM and PM peak hours with the addition of ambient traffic growth and cumulative projects traffic.

9.3.2 *Year 2024 Cumulative Plus Project Traffic Conditions*

Review of Columns 3 and 4 of *Table 9-3* indicates that traffic associated with the proposed Project ***will not*** significantly impact any of the six (6) state-controlled study intersections, when compared to the LOS standards specified in this report. The six (6) state-controlled study intersections are forecast to continue to operate at acceptable LOS D or better with the addition of project generated traffic in the Year 2024.

Appendix C presents the existing plus project and Year 2024 plus project HCM/LOS calculations for the six (6) state-controlled study intersections.

9.4 Recommended Improvements – Caltrans Analysis

The results of the Caltrans analyses presented previously in *Tables 9-2* and *9-3* indicate that the proposed Project will not significantly impact any of the six (6) state-controlled study intersections under "Existing Plus Project" and "Year 2024 Cumulative Plus Project" traffic conditions. As there are no significant impacts, no traffic mitigation measures are required or recommended for the six (6) state-controlled study intersections.

10.0 RECOMMENDED IMPROVEMENTS

For those intersections where projected Project traffic volumes are expected to result in unacceptable operating conditions, traffic impact studies of this type typically recommend (identify) improvement measures that change the intersection geometry to increase capacity. These capacity improvements involve roadway widening and/or re-striping to reconfigure (add lanes) to specific approaches of a key intersection. The identified improvements are expected to:

- mitigate the impact of existing traffic, Project traffic and future non-project (ambient traffic growth and cumulative project) traffic and
- improve Levels of Service to an acceptable range and/or to pre-project conditions.

10.1 Existing Plus Project Traffic Conditions

The results of the intersection capacity analysis presented previously in *Table 8-1* show that the proposed Project will not significantly impact any of the thirty five (35) key study intersections under the “Existing Plus Project” traffic scenario. Given that there are no significant project impacts, no improvements are required to address this traffic scenario.

10.2 Year 2024 Plus Project Traffic Conditions

The results of the intersection capacity analysis presented previously in *Table 8-2* show that the proposed Project will not significantly impact any of the thirty five (35) key study intersections under the “Year 2024 Plus Project” traffic scenario. Given that there are no significant project impacts, no improvements are required to address this traffic scenario.

11.0 FOCUSED SATURDAY EVALUATION

In collaboration with City of Costa Mesa staff, six (6) of the thirty five (35) key study intersections have been selected for Saturday evaluation. The six (6) key study intersections consist of the following:

6. Pinecreek Drive/S Street at Adams Avenue
10. Fairview Road at Adams Avenue/El Camino Drive
11. Fairview Road at Monitor Way
12. Fairview Road at Pirate Way/Mustang Way
13. Fairview Road at Arlington Drive
14. Fairview Road at Merrimac Way

11.1 Saturday Project Trip Generation

Table 11-1 summarizes the trip generation rates used in forecasting the Saturday daily and peak hour vehicular trips generated by the four components of the proposed Project (i.e. student growth, student housing, mixed use development and recycling center expansion).

Table 11-2 presents the proposed Project's forecast Saturday peak hour and daily traffic volumes. Review of the upper portion of *Table 11-2* shows that the student growth component of the proposed project (i.e. net increase of 6,922 students) is forecast to generate 2,907 daily Saturday trips with 346 Saturday trips forecast during the Midday peak hour. The student housing component of the proposed project (i.e. 818 beds) is forecast to generate 1,947 daily Saturday trips with 147 Saturday trips forecast during the Midday peak hour.

Review of the middle portion of *Table 11-2* shows that the mixed use development component of the proposed project (i.e. 89,000 SF conference/education office space and 15,000 SF shopping center) is forecast to generate 2,735 daily Saturday trips with 268 Saturday trips forecast during the Midday peak hour. Review of the lower portion of *Table 11-2* shows that the recycling center expansion component of the proposed project is forecast to generate 1,296 net daily Saturday trips with 216 net Saturday trips forecast during the Midday peak hour.

Overall, as shown at the bottom of *Table 11-2,* the proposed Project is forecast to generate approximately 8,885 daily Saturday trips with 977 Saturday trips (529 inbound, 448 outbound) produced in the Midday peak hour.

11.2 Saturday Traffic Volumes

Existing Saturday Midday peak hour traffic volumes for the six (6) key study intersections were obtained from manual peak hour turning movement counts conducted by Transportation Studies, Inc. on March 7, 2015 between 11:00 AM and 2:00 PM. The counts were targeted for this period with the intent to capture the greatest two-way (inbound plus outbound) Saturday hourly volume of the existing campus setting. It should be noted that the Saturday traffic count time period was approved by City of Costa Mesa staff.

TABLE 11-1
SATURDAY PROJECT TRAFFIC GENERATION RATES[14]

Project Description	Daily 2-Way	Midday Peak Hour Enter	Midday Peak Hour Exit	Midday Peak Hour Total
Student Growth				
▪ 540: Junior College (TE/Student)	0.42	0.03	0.02	0.05
Mixed Use Development				
▪ 710: General Office Building (TE/1,000 SF)	2.46	0.23	0.20	0.43
▪ 820: Shopping Center (TE/1,000 SF)[15]	186.40	8.84	8.16	17.00
Student Housing				
▪ Student Housing Empirical Rate (TE/Bed)	2.38	0.09	0.09	0.18
Recycling Center Expansion				
▪ Existing Recycling Center Trip Generation[16]	648	54	54	108
➢ Proposed Expansion (3 Times Existing Trips)				

---

14 Unless otherwise noted, Source: *Trip Generation*, 9th Edition, Institute of Transportation Engineers (ITE), Washington, D.C. (2012).

15 The trip generation rates are based on the following equations.
- Saturday Daily: LN (T) = 0.63 LN(X) + 6.23; 50% Enter and 50% Exit
- Saturday Midday Peak Hour: LN (T) = 0.65 LN(X) + 3.78; 52% Enter and 48% Exit

16 Source: Traffic counts/observations conducted at the existing recycling center in March 2015.

TABLE 11-2
SATURDAY PROJECT TRAFFIC GENERATION FORECAST

Project Description	Daily 2-Way	Midday Peak Hour		
		Enter	Exit	Total
Student Growth				
▪ Net Increase 6,922 Students	2,907	208	138	346
Student Housing				
▪ Student Housing – 818 Beds	1,947	73	74	147
Mixed Use Development				
▪ 89,000 SF Conference/Education Office Space	219	20	18	38
▪ 15,000 SF Shopping Center	2,796	133	122	255
Pass-By Reduction[17]	-280	-13	-12	-25
Subtotal	2,516	120	110	230
Total Mixed Use Development	***2,735***	***140***	***128***	***268***
Recycling Center Expansion				
▪ Existing Recycling Center Trip Generation	648	54	54	108
▪ With Proposed Expansion Project (3 Times Existing Trips)[18]	1,944	162	162	324
Total Net Recycling Center Expansion Trips (Proposed Minus Existing)	***1,296***	***108***	***108***	***216***
Total Trip Generation Potential	**8,885**	**529**	**448**	**977**

17 Pass-by trips are trips made as intermediate stops on the way from an origin to a primary trip destination. Pass-by trips are attracted from traffic passing the site on adjacent streets (i.e. Fairview Road and Merrimac Way), which contain direct access to the generator. Although the *Trip Generation Handbook* recommends a Saturday Midday peak hour pass-by percentage of 26%, 10% was utilized for the Saturday Midday peak hour consistent with City of Costa Mesa requirements and to provide a conservative analysis. The daily peak hour pass-by percentage was estimated to be 10%, consistent with City of Costa Mesa requirements.

18 At completion of the proposed recycling center expansion, it is expected that the site would collect triple the amount of waste that is currently collected at the existing facility, thus resulting in triple the amount of visitors to the expanded site.

Figure 11-1 illustrates the existing Saturday Midday peak hour traffic volumes at the six (6) key study intersections evaluated as part of the focused Saturday evaluation.

Existing plus project Saturday traffic volumes, Year 2024 cumulative Saturday traffic volumes and Year 2024 cumulative plus project Saturday traffic volumes were developed utilizing the new counts combined with Saturday cumulative project information and Saturday project trip generation information. Project traffic assignments are consistent with the project traffic distribution patterns discussed previously in Section 5.2 of this report.

The anticipated Saturday Midday peak hour project traffic volumes associated with the Project are presented in ***Figure 11-2***. ***Figure 11-3*** presents projected Saturday Midday peak hour traffic volumes at the six (6) key study intersections with the addition of the trips generated by the proposed Project to existing traffic volumes.

Figure 11-4 presents the Year 2024 Saturday Midday peak hour cumulative traffic volumes at the six (6) key study intersections. ***Figure 11-5*** illustrates the Year 2024 forecast Saturday Midday peak hour traffic volumes with the inclusion of the trips generated by the proposed Project.

11.3 Saturday Traffic Assessment

An existing plus project Saturday analysis and a Year 2024 Saturday analysis was prepared for the six (6) key study intersections. The following summarizes the results of the Saturday analyses.

11.3.1 *Existing Plus Project Saturday Traffic Conditions*

Table 11-3 summarizes the peak hour Level of Service results at the six (6) key study intersections for existing plus project Saturday traffic conditions. The first column (1) of ICU/LOS values in *Table 11-3* presents a summary of existing Saturday Midday peak hour traffic conditions. The second column (2) lists existing plus project Saturday traffic conditions. The third column (3) shows the increase in ICU value due to the added peak hour Project trips and indicates whether the traffic associated with the Project will have a significant impact based on the City's LOS standards and significant impact criteria.

Review of Columns 2 and 3 of *Table 11-3* indicates that traffic associated with the proposed Project ***will not*** significantly impact any of the six (6) key study intersections. The six (6) key study intersections currently operate and are forecast to continue to operate at an acceptable service level during the Saturday Midday peak hour with the addition of Project generated traffic to existing traffic.

11.3.2 *Year 2024 Plus Project Saturday Traffic Conditions*

Table 11-4 summarizes the Saturday peak hour Level of Service results at the six (6) key study intersections for the Year 2024 horizon year. The first column (1) of ICU/LOS values in *Table 11-4* presents a summary of existing Saturday Midday peak hour traffic conditions. The second column (2) lists projected Saturday cumulative traffic conditions (existing plus ambient plus cumulative projects traffic) based on existing intersection geometry, but without any traffic generated from the

proposed Project. The third column (3) presents forecast Year 2024 Saturday traffic conditions with the addition of Project traffic. The fourth column (4) shows the increase in ICU value due to the added peak hour Project trips and indicates whether the traffic associated with the Project will have a significant impact based on the City's LOS standards and significant impact criteria.

Review of Columns 3 and 4 of *Table 11-4* indicates that traffic associated with the proposed Project ***will not*** significantly impact any of the six (6) key study intersections. The six (6) key study intersections are forecast to continue to operate at an acceptable service level (based on the City's criteria) during the Saturday Midday peak hour with the addition of Project generated traffic to existing traffic, ambient growth traffic and cumulative projects traffic.

Appendix D presents the Saturday existing plus project and Saturday Year 2024 plus project ICU/LOS calculations for the six (6) key study intersections.

11.4 Conclusion

The results of the above analyses indicate that, based on City criteria for overall intersection operation, the proposed Project ***will not*** significantly impact any of the six (6) key study intersections under existing plus project Saturday traffic conditions or under Year 2024 plus project Saturday traffic conditions. Given that there are no significant project impacts, no capacity-enhancing improvements are required.

12.0 INTERSECTION LEFT-TURN QUEUING ANALYSIS

This section of the report addresses City staff concerns regarding weekday peak hour left-turn stacking/storage lengths for various intersections in the immediate vicinity of the project site. Specifically, City staff has concerns with the following left-turn pocket storage capabilities:

- Harbor Boulevard at Merrimac Way (southbound left-turn)
- Pinecreek Drive/S Street at Adams Avenue (westbound left-turn)
- Fairview Road at Monitor Way (northbound left-turn)
- Fairview Road at Pirate Way/Mustang Way (northbound left-turn)
- Fairview Road at Arlington Drive (northbound left-turn)
- Fairview Road at Merrimac Way (northbound left-turn)

A queuing evaluation was prepared for the identified left turn pockets at the six aforementioned intersections. The queuing evaluation was conducted based on projected Year 2024 peak hour traffic volumes and the Highway Capacity Manual (HCM) signalized methodology. ***Table 12-1*** presents the Year 2024 left-turn queuing analysis results for the aforementioned six key study intersections. It should be noted that this table presents results for the average queue, 70th percentile queue, 85th percentile queue and the 95th percentile queue. Column (1) presents Year 2024 cumulative traffic conditions and column (2) presents Year 2024 cumulative plus project traffic conditions.

Review of *Table 12-1* shows that adequate storage is provided for the aforementioned left-turn pockets at four of the six intersections during the AM and PM peak hours. The average queue, 70th percentile queue, 85th percentile queue and 95th percentile queue are satisfied for the aforementioned left-turn pockets at the intersections of Fairview Road/Monitor Way, Fairview Road/Pirate Way-Mustang Way, Fairview Road/Arlington Drive and Fairview Road/Merrimac Way in the Year 2024 without and with the proposed Project.

For the intersection of Harbor Boulevard/Merrimac Way, the existing storage for the dual southbound left-turn lanes can accommodate the average queue during the AM and PM peak hours in the Year 2024 with the proposed Project. The 70th percentile queue is also accommodated except during the PM peak hour. However, the 24 feet (240 - 264) that exceeds the existing storage during the PM peak hour can be accommodated within the transition area in advance of the pocket itself. The existing storage is exceeded during the AM and PM peak hours for the 85th and 95th percentile queues. However, with a cycle length of 120 seconds, the 85th and 95th percentile queues can be expected to occur only during a few signal cycles within the peak hours, which may cause some vehicles to intermittently queue into the number 1 through travel lane. During all other time periods, the queues will be accommodated within the existing turn pockets. It should be noted that the southbound left-turn pocket lengths are currently at their maximum feasible formalized storage length and lengthening them is not considered feasible.

For the intersection of Pinecreek Drive/S Street at Adams Avenue, the existing storage for the dual westbound left-turn lanes is exceeded with the proposed Project in the Year 2024 during the AM and PM peak hours for all reported queues. It should be noted that the average queue is calculated to exceed the existing pocket storage by 14 feet during the AM and PM peak hours, and can be accommodated within the transition area in advance of the formalized pocket. With a cycle length of 120 seconds, the 70th, 85th and 95th percentile queues can be expected to occur only during a few signal cycles within the peak hours, which may cause some vehicles to intermittently queue into the number 1 through travel lane. During all other time periods, the queues will be accommodated within the existing turn pockets. It should be noted that the westbound left-turn pocket lengths are currently at their maximum feasible formalized storage length and lengthening them is not considered feasible.

Appendix E presents the Year 2024 left-turn queuing calculation worksheets.

13.0 Parking Structure Evaluation

The prior project plan proposed a parking structure located at the intersection of Fairview Road/Arlington Drive that would be a shared use between Orange Coast College and the Fairgrounds during events at the Fairgrounds and/or Amphitheater. However, the plan as currently proposed has removed that parking structure from the plan and instead includes a new parking structure located within a portion of the Adams parking lot. This structure, as currently proposed, would not be shared with the Fairgrounds based on coordination with Orange Coast College administration staff. Nonetheless the following summarizes typical yearly special events at the Fairgrounds relative to activity at Orange Coast College, to address prior City of Costa Mesa comments.

13.1 Fairgrounds Events

Information was obtained from Fairgrounds administration staff regarding their typical yearly special events. The table below summarizes those typical yearly special events. The name of the event and the event schedule (i.e. days of the week the event occurs on) are listed.

Fairgrounds Special Event Summary Table

Event Name	Event Schedule
Amphitheater Concerts	Wednesday, Thursday, Friday, Saturday or Sunday in July and August
Orange County Fair	Wednesday – Sunday in July and August
MUSINK	Friday – Sunday in March
SCOTSFEST	Saturday and Sunday in May
Sand Sports Super Show	Friday – Sunday in September
Pet Expo	Friday – Sunday in April
Gem Fair	Friday – Sunday in February
Gun Show	Saturday and Sunday in May

As shown in the above table, the typical yearly cycle of special events occur on a Friday, Saturday or Sunday. The exceptions are Amphitheater Concerts and the Orange County Fair, which also occur on a Wednesday or Thursday. Even though these two events also occur on a Wednesday or Thursday, they both occur during the summer months (i.e. July and August) when Orange Coast College is in "summer session" and operating well below its normal peak that occurs during the school year (i.e. during fall semester and winter/spring semester).

Based on the above, it can be qualitatively concluded that events at the Fairgrounds and/or Amphitheater generally occur outside the peak operating times of Orange Coast College. As such, the traffic analysis contained within Section 8.0 of this report addressed the most conservative "worse case" traffic scenario.

14.0 SUMMARY OF FINDINGS AND CONCLUSIONS

- ***Project Description*** **–** The approximately 160-acre project site is generally located west of Fairview Road between Adams Avenue and Merrimac Way in the City of Costa Mesa, California. The proposed Project will consist of the construction of new campus facilities and the renovation of existing campus facilities to meet the District's instructional needs and to accommodate growth in the student body over the planning horizon and beyond for in-district students and out-of-district students. In addition to the new and/or renovated instructional space, the proposed Project will also consist of the construction of on-campus student housing, the construction of a mixed-use development consisting of conference/education office space, retail and/or food uses, an expansion/renovation to the existing recycling center and the construction of a new parking structure.

  In order to facilitate the development of trip generation forecasts for the proposed Project, the aforementioned project description has been divided amongst four categories. These four categories consist of development related to 1) student growth; 2) the on-campus student housing project; 3) the mixed-use development project and 4) the recycling center expansion project. All project components are expected to be completed by the Year 2024. The following describes each of the four categories in detail.

  - <u>Student Growth</u>: Orange Coast College has a current student enrollment of 21,410 students. As stated above, the renovation of existing campus facilities and the construction of new campus facilities, including the proposed parking structure to be located on a portion of the Adams parking lot are required to meet the District's instructional needs and to accommodate growth in the student body for in-district students and out-of-district students. At completion of the Master Plan, Orange Coast College is projected to accommodate a future student enrollment of 28,332 students, resulting in a net increase of 6,922 students.

  - <u>Student Housing</u>: The on-campus student housing project component will be generally located on the southwest corner of the intersection of Pinecreek Drive/S Street and Adams Avenue in the northwest corner of campus. The on-campus student housing project component will consist of 818 beds.

  - <u>Mixed-Use Development:</u> The mixed-use development project component will be generally located on the northwest corner of the intersection of Fairview Road and Merrimac Way in the southeast corner of campus. The mixed-use development project component will consist of 89,000 SF of conference/education office space and up to 15,000 SF of retail/fast-casual restaurant space.

  - <u>Recycling Center Expansion:</u> The recycling center currently exists on the north end of the campus between the athletic fields, with two access points currently provided along Adams Avenue (i.e. one inbound only driveway and one outbound only driveway). As shown in *Figure 2-2,* the recycling center will remain in its current location; however it will be expanded for the purposes of accommodating recycling demand in the City of Costa Mesa. The expanded facility will provide a greater area for visitors to drop off recyclable materials at designated areas, provide more parking for patrons, provide a greater area for equipment storage and provide an area for outdoor instructional space. Access to the expanded facility will remain unchanged with one inbound only driveway and one outbound only driveway to be provided along Adams Avenue. A deceleration lane will also be provided along Adams Avenue at the inbound only driveway. At completion of the proposed recycling center expansion, it is expected that the site would collect triple the amount of waste that is currently collected at the existing facility, thus resulting in triple the amount of visitors to the expanded site.

Vehicular access to the campus would continue to be provided from Adams Avenue, Fairview Road and Merrimac Way. The vehicular entries from Monitor Way, Pirate Way and Arlington Drive would be enhanced with the addition of formal gateways and marked pedestrian drop-off points. The primary entry into Lot E off of Merrimac Way would also be enhanced. A new right-turn in/right-turn out only driveway would also be provided along Adams Avenue, located on the west end of the campus, near the proposed student housing project component (study location #35).

- ***Study Scope*** **–** The thirty five (35) key study intersections were selected for detailed peak hour level of service analyses under Existing Traffic Conditions, Existing Plus Project Traffic Conditions, Year 2024 Cumulative Traffic Conditions and Year 2024 Cumulative plus Project Traffic Conditions.

Key Study Intersections

1. Harbor Boulevard at Gisler Avenue
2. Harbor Boulevard at Baker Street
3. Harbor Boulevard at Adams Avenue
4. Harbor Boulevard at Merrimac Way
5. Harbor Boulevard at Fair Drive
6. Pinecreek Drive/S Street at Adams Avenue
7. Fairview Road at I-405 NB Ramps
8. Fairview Road at I-405 SB Ramps
9. Fairview Road at Baker Street
10. Fairview Rd at Adams Ave/El Camino Dr
11. Fairview Road at Monitor Way
12. Fairview Rd at Pirate Way/Mustang Way
13. Fairview Road at Arlington Drive
14. Fairview Road at Merrimac Way
15. Fairview Road at Fair Drive
16. Lot C Driveway at Merrimac Way
17. Lot D Driveway at Merrimac Way
18. Lot D Dwy (Right-In/Out Only) at Merrimac Way
19. Lot D Dwy (Right-In/Out Only) at Merrimac Way
20. Lot E Driveway at Merrimac Way
21. Lot E Driveway (Right-In/Out Only) at Merrimac Way
22. Lot E Driveway/Church Driveway at Merrimac Way
23. Lot E Driveway (Right-In/Out Only) at Merrimac Way
24. Recycling Center Driveway No. 1 at Adams Avenue
25. Recycling Center Driveway No. 2 at Adams Avenue
26. Placentia Avenue/Mesa Verde Drive at Adams Avenue
27. Harbor Boulevard at South Coast Drive
28. Harbor Boulevard at I-405 NB Ramps
29. Harbor Boulevard at I-405 SB Ramps
30. Harbor Boulevard at Victoria Street
31. Fairview Road at South Coast Drive
32. Bear Street at Baker Street
33. Newport Boulevard at SR-55 SB Ramps/Fair Drive
34. Newport Blvd/SR-55 NB Ramps at Fair Drive/Del Mar Ave
35. Project Dwy (near student housing component) at Adams Ave

- ***Existing Traffic Conditions*** – All key study intersections currently operate at an acceptable service level during the AM and PM peak hours.

- ***Project Trip Generation*** – The student growth component of the proposed project (i.e. net increase of 6,922 students) is forecast to generate 8,798 daily trips, with 865 trips forecast during the AM peak hour and 976 trips forecast during the PM peak hour. The student housing component of the proposed project (i.e. 818 beds) is forecast to generate 1,947 daily trips, with 58 trips forecast during the AM peak hour and 123 trips forecast during the PM peak hour. The mixed use development component of the proposed project (i.e. 89,000 SF conference/education office space and 15,000 SF shopping center) is forecast to generate 2,763 daily trips, with 188 trips forecast during the AM peak hour and 284 trips forecast during the PM peak hour. The recycling center expansion component of the proposed project is forecast to generate 988 net daily trips, with 20 net trips forecast during the AM peak hour and 120 net trips forecast during the PM peak hour. Overall, as shown at the bottom of *Table 5-2*, the proposed Project is forecast to generate approximately 14,496 daily trips, with 1,131 trips (936 inbound, 195 outbound) produced in the AM peak hour and 1,503 trips (731 inbound, 772 outbound) produced in the PM peak hour on a typical weekday.

- ***Cumulative Projects Traffic Characteristics*** **–** The eight (8) cumulative projects are forecast to generate a combined total of 6,578 daily trips, with 418 trips (167 inbound and 251 outbound) forecast during the AM peak hour and 607 trips (289 inbound and 318 outbound) forecast during the PM peak hour.

- ***Existing Plus Project Traffic Conditions*** **–** The proposed Project ***will not*** significantly impact any of the thirty five (35) key study intersections, when compared to the LOS standards and significant impact criteria specified in this report. The thirty five (35) key study intersections currently operate and are forecast to continue to operate at an acceptable service level during the AM and PM peak hours with the addition of Project generated traffic to existing traffic.

- ***Year 2024 Cumulative Plus Project Traffic Conditions*** – The proposed Project ***will not*** significantly impact any of the thirty five (35) key study intersections, when compared to the LOS standards and significant impact criteria specified in this report. Although the intersection of Harbor Boulevard at Victoria Street is forecast to operate at unacceptable LOS E during the PM peak hour with the addition of project traffic, the proposed Project is expected to add less than 0.010 to the ICU value. The remaining thirty four key study intersections are forecast to continue to operate at an acceptable service level during the AM and PM peak hours with the addition of Project generated traffic to existing traffic, ambient growth traffic and cumulative projects traffic.

- ***State of California (Caltrans) Methodology*** **–** The results of the "Existing Plus Project" and "Year 2024 Plus Project" traffic analyses using the State of California (Caltrans) Methodology indicate that the proposed Project will not significantly impact the six (6) state-controlled study intersections. As there are no significant impacts, no traffic mitigation measures are required or recommended for the six (6) state-controlled study intersections.

- ***Recommended Existing Plus Project Improvements –*** The results of the intersection capacity analysis presented previously in *Table 8-1* shows that the proposed Project will not significantly impact any of the thirty five (35) key study intersections under the "Existing Plus Project" traffic scenario. Given that there are no significant project impacts, no improvements are required to address this traffic scenario.

- ***Recommended Year 2024 Plus Project Improvements –*** The results of the intersection capacity analysis presented previously in *Table 8-2* shows that the proposed Project will not significantly impact any of the thirty five (35) key study intersections under the "Year 2024 Plus Project" traffic scenario. Given that there are no significant project impacts, no improvements are required to address this traffic scenario.

- ***Focused Saturday Evaluation –*** The results of the focused Saturday evaluation indicates that the proposed Project ***will not*** significantly impact any of the six (6) key study intersections under existing plus project Saturday traffic conditions or under Year 2024 plus project Saturday traffic conditions. Given that there are no significant project impacts, no improvements are required.

- ***Intersection Left-Turn Queuing Analysis –*** Adequate storage is provided for the identified left-turn pockets at four of the six intersections during the AM and PM peak hours. The average queue, 70th percentile queue, 85th percentile queue and 95th percentile queue are satisfied for the identified left-turn pockets at the intersections of Fairview Road/Monitor Way, Fairview Road/Pirate Way-Mustang Way, Fairview Road/Arlington Drive and Fairview Road/Merrimac Way in the Year 2024 without and with the proposed Project.

  For the intersection of Harbor Boulevard/Merrimac Way, the existing storage for the dual southbound left-turn lanes can accommodate the average queue during the AM and PM peak hours in the Year 2024 with the proposed Project. The 70th percentile queue is also accommodated except during the PM peak hour. However, the 24 feet (240 - 264) that exceeds the existing storage during the PM peak hour can be accommodated within the transition area in advance of the pocket itself. The existing storage is exceeded during the AM and PM peak hours for the 85th and 95th percentile queues. However, with a cycle length of 120 seconds, the 85th and 95th percentile queues can be expected to occur only during a few signal cycles within the peak hours, which may cause some vehicles to intermittently queue into the number 1 through travel lane. During all other time periods, the queues will be accommodated within the existing turn pockets. It should be noted that the southbound left-turn pocket lengths are currently at their maximum feasible formalized storage length and lengthening them is not considered feasible.

  For the intersection of Pinecreek Drive/S Street at Adams Avenue, the existing storage for the dual westbound left-turn lanes is exceeded with the proposed Project in the Year 2024 during the AM and PM peak hours for all reported queues. It should be noted that the average queue is calculated to exceed the existing pocket storage by 14 feet during the AM and PM peak hours, and can be accommodated within the transition area in advance of the formalized pocket. With a cycle length of 120 seconds, the 70th, 85th and 95th percentile queues can be expected to occur only during a few signal cycles within the peak hours, which may cause some vehicles to intermittently queue into the number 1 through travel lane. During all other time periods, the queues will be accommodated within the existing turn pockets. It should be noted that the westbound left-turn pocket lengths are currently at their maximum feasible formalized storage length and lengthening them is not considered feasible.

- ***Parking Structure Evaluation –*** The typical yearly cycle of special events at the Fairgrounds occur on a Friday, Saturday or Sunday. The exceptions are Amphitheater Concerts and the Orange County Fair, which also occur on a Wednesday or Thursday. Even though these two events also occur on a Wednesday or Thursday, they both occur during the summer months (i.e. July and August) when Orange Coast College is in "summer session" and operating well below its normal peak that occurs during the school year (i.e. during fall semester and winter/spring semester). Based on the above, it can be qualitatively concluded that events at the Fairgrounds and/or Amphitheater generally occur outside the peak operating times of Orange Coast College. As such, the traffic analysis contained within Section 8.0 of this report addressed the most conservative "worse case" traffic scenario.
