The Project is proposing to incorporate upgrades and repairs to existing buildings; construct new facilities; implement various parking, vehicular, and pedestrian circulating improvements; develop new facilities and improve existing programs within the existing 160-acre OCC campus. OCC is an active college offering day and night courses; and therefore, has a high volume of foot-traffic and human presence throughout the day. Since the proposed project would occur within the college campus modifications would not change the existing conditions and use within the project area. Additionally, this campus is bordered by high- and low- density residential and commercial developments offering minimal suitable habitat to support special-status species. The project area is primarily developed or disturbed. Dominant vegetation on site is comprised of ornamental plantings. Although the ruderal and eucalyptus woodland areas have the potential to support special-status species adapted to urban and disturbed environments, these land cover types are limited within the project area, and combined make up less than 3 acres of the total project site. Native plant communities were not mapped on site.

The Project is not located within or adjacent to any designated conservation plan, natural community conservation plan, or local or regional habitat conservation plan areas; and would therefore not impact the goals and objectives of any adopted plans. Although an official Jurisdictional Delineation was not performed, jurisdictional wetlands or non-wetland waters were not identified within the project area. Additionally, riparian habitats were not identified within the project area. Therefore, implementation of the proposed project activities would not result in impacts to state and federally jurisdictional waters (and wetlands) or riparian habitat.

The Project is subject to local, state and federal laws and regulations pertaining to biological resources, including the federal MBTA and California Fish and Game Codes. There are three special-status wildlife species with moderate potential to occur within the project area. No special-status plants are likely to occur within the project area. Potential project impacts to these species are discussed in detail below.

Plants

Special-status plants are not known to occur within the study area; nor do any special-status plant species have a potential to occur within the proposed project area. The project is planned to occur within an existing college campus, surrounded by residential and commercial development. The ruderal habitat mapped within the project area is the only land cover type with any potential, though minimal, to support special-status species. Ruderal habitat on site is found in a single area within the project area, totaling 1.78 acres. Additionally, this land cover appears to be compacted and routinely disturbed. Therefore, implementation of the proposed project is not anticipated to impact special-status plant species.

Avian

Although no special-status avian species are known to occur within the study area, there is potential for one sensitive avian species to occur within the proposed project area; Cooper's hawk (California Watch List species) (nesting only). Cooper's hawk populations have increasingly been observed breeding within urban and suburban areas (Curtis and Rosenfield 2006). In urban areas, Cooper's hawks are known to nest within tall ornamental trees (e.g., eucalyptus spp.) within developed areas (including commercial and industrial areas) (Chiang et al. 2012). Data documented by Chiang (2004) suggest that Cooper's hawks in Southern California appear to be year-round residents and remain close to their nest stands during winter. While the project area contains tall ornamental trees (i.e., eucalyptus and pine species) that provide suitable nesting substrate to support this species, no raptor nests were identified during the field visit. Additionally, Cooper's hawk was not observed during the site visit nor are there any documented occurrences within 5 miles of the project site (CDFW 2013). Therefore, likelihood of this species to nest within the project area is minimal. Impacts to this species are anticipated to be less than significant. Nonetheless, it is recommended that the proposed project activities be planned to occur outside of the general nesting season (February 1 to August 31). If construction activities must occur within the general nesting season, a preconstruction nesting bird survey is recommended, as per the guidelines below.

The eucalyptus woodland, ornamental planting, and ruderal habitat within the project area have the potential to support nesting birds protected under the federal Migratory Bird Treaty Act (MBTA) and/or California Department of Fish and Game Code (including Cooper's hawk discussed above). If construction activities are scheduled to take place adjacent to potential bird nesting habitat during the general bird breeding season (i.e., February 1 through August 31), it is recommended that a nesting bird survey be conducted by a qualified biologist to determine the presence of nests or nesting birds within 300 feet (500 feet for raptors) (given the level of disturbance associated with the project area) of the construction activities. The nesting bird survey shall be completed no more than 72 hours prior to any construction activities.

The survey will focus on special-status species known to use the area as well as other nesting birds that are protected under the MBTA and California Fish and Game Codes. If an active nest (defined by the presence of eggs or young) is identified, grading or site disturbance within an appropriate buffer (e.g., 500 feet for raptors and 250 feet for other birds) of the nest shall be monitored by a qualified biologist regularly until project activities are no longer occurring within the required avoidance buffer of the nest or until fledglings become independent of the nest. The monitoring biologist may adjust the buffer radius if he or she determines it is necessary. The monitoring biologist shall halt construction activities determined to be disturbing nesting activities. The monitor shall make practicable recommendations to reduce the noise or disturbance in the vicinity of the nest. This may include recommendations such as (1) turning off vehicle engines and other equipment whenever possible to reduce noise, (2) working in other areas until the young have fledged, or (3) placing noise barriers to maintain the noise at the nest to 60 dBA L_{eq} hourly or less or to the preconstruction ambient noise level if that exceeds 60 dBA L_{eq} hourly. The on-site biologist will review and verify compliance with these nesting boundaries and will verify that the nesting effort has finished. Construction activities restricted by this measure can resume when no other active nests are found within the restricted area.

"Nest" is defined as: a structure or site under construction or preparation, constructed or prepared, or being used by a bird for the purpose of incubating eggs or rearing young. Perching sites and screening vegetation are not part of the nest. "Active nest" is defined as: once birds begin constructing, preparing or using a nest for egg-laying. A nest is no longer an "active nest" if abandoned by the adult birds or once nestlings or fledglings are no longer dependent on the nest.

Invertebrates

Monarch butterfly (not state- or federally listed) has a moderate potential to overwinter within the project site; however, impacts are anticipated to be negligible. The eucalyptus woodland and some of the ornamental planting land cover (e.g., *pinus* spp.) provide suitable overwintering habitat for monarchs. Monarch overwintering sites are well known throughout California and overwintering sites have not been documented within the project area. Therefore, impacts to this species are anticipated to be less than significant.

Mammals

Yuma myotis (not state- or federally listed) is the only special status mammal species with moderate potential to occur on site. The field visit occurred during the day, which is conducive for detecting most of the wildlife expected to occur within the project area, but may not be appropriate for directly detecting wildlife species (such as bats) that are active at night and dormant during the daytime.

Yuma myotis is known to occur within urban areas and is a common species of Orange County (Sea and Sage Audubon Society 2013); however, this species has not been documented to occur within 5 miles of the proposed project area (CDFW 2013). The closest known occurrence of this species is approximately 18 miles northeast of the project area within Santa Ana Canyon (CDFW 2013). Although the building site could provide potential day roosts for this species, the proposed project site does not contain open waters required by Yuma myotis for foraging and as a drinking source (Zeiner et al. 1988). The closest suitable water source is approximately 0.5 mile east of the project site at Te Winkle Park north of Arlington Drive and 0.75 miles west of the project at the Costa Mesa Golf Course; and this species has not been documented in these areas. Additionally, OCC offers a wide array of classes scheduled throughout the day, with classes beginning as early as 7 am and offered until as late as 10:30 pm, so there is a high level of human activity within the project area during most hours of the day. Given the absence of historic occurrences of this species within the project area, lack of suitable foraging habitat, and the high level of human activity within the project area, this species is not anticipated to occur within the project area. Since the proposed project would occur within the existing campus boundary, overall population effects and impacts to this species range are also not anticipated. Impacts to this species are anticipated to be less than significant.

If you have any questions regarding this report, please contact me via telephone at 661.705.8613 or via email at jpage@dudek.com.

Sincerely,

Johanna C. Page

APPENDIX A

List of Vascular Plant and Wildlife Species Observed Within the Project Boundary

APPENDIX A
List of Vascular Plant and Wildlife Species Observed within the Project Boundary

VASCULAR PLANT SPECIES

GYMNOSPERMS

GINKGOACEAE – GINKGO FAMILY

* *Ginkgo biloba* – maidenhair tree

PINACEAE – PINE FAMILY

Pinus sp. – pine

ANGIOSPERMS (DICOTS)

ANACARDIACEAE **– SUMAC FAMILY**

* *Schinus molle* – Peruvian peppertree

ASTERACEAE **– SUNFLOWER FAMILY**

Erigeron canadensis – Canadian horseweed
Laennecia coulteri – Coulter's horseweed

BIGNONIACEAE **– BIGNONIA FAMILY**

* *Jacaranda mimosifolia* – blue jacaranda

CUPRESSACEAE **– CYPRESS FAMILY**

* *Cupressus sempervirens* – Italian cypress

GERANIACEAE – GERANIUM FAMILY

* *Erodium* spp. – filaree

LAMIACEAE **– MINT FAMILY**

Mentha spp. – mint
* *Rosmarinus officinalis* – rosemary

MAGNOLIACEAE **– MAGNOLIA FAMILY**

* *Magnolia grandiflora* – southern magnolia

MALVACEAE **– MALLOW FAMILY**

* *Malva parviflora* – cheeseweed mallow

MYRTACEAE **– MYRTLE FAMILY**

* *Eucalyptus* sp. – eucalyptus
* *Callistemon viminalis* – weeping bottlebrush.

***SAPINDACEAE* – SOAPBERRY FAMILY**

* *Cupaniopsis anacardioides* – carrotwood

***STRELITZIACEAE* – STRELITZIA FAMILY**

* *Strelitzia reginae* – bird-of-paradise

***ZYGOPHYLLACEAE* – CALTROP FAMILY**

* *Tribulus terrestris* – puncturevine

ANGIOSPERMS (MONOCOTS)

ARECACEAE – PALM FAMILY

Washingtonia filifera – California fan palm

***POACEAE* – GRASS FAMILY**

* *Schismus barbatus* – common Mediterranean grass

WILDLIFE SPECIES – VERTEBRATES

BIRDS

***COLUMBIDAE* – PIGEONS AND DOVES**

Zenaida macroura – mourning dove

***CORVIDAE* – JAYS AND CROWS**

Corvus brachyrhynchos – American crow

FRINGILLIDAE – FINCHES

Carpodacus mexicanus – house finch

HIRUNDINIDAE – SWALLOWS

Tachycineta thalassina – violet-green swallow

***ICTERIDAE* – BLACKBIRDS AND ORIOLES**

Icterus curcullatus – hooded oriole

***MIMIDAE* – THRASHERS**

Mimus polyglottos – northern mockingbird

***TROCHILIDAE* – HUMMINGBIRDS**

Calypte anna – Anna’s hummingbird

***TYRANNIDAE* – TYRANT FLYCATCHERS**

Sayornis nigricans – black phoebe

MAMMALS

***LEPORIDAE* – HARES AND RABBITS**

Sylvilagus audubonii – desert cottontail

*	Signifies introduced (non-native) species

APPENDIX B

Matrix of Vascular Plant Species and Potential to Occur

APPENDIX B
Matrix of Special-Status Plant Species and Potential to Occur

Scientific Name	Common Name	Status (Federal/State/ CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
Abronia villosa var. *aurita*	chaparral sand-verbena	None/ None/ 1B.1	Chaparral, Coastal scrub, Desert dunes/sandy/ annual herb/ Jan-Sep/ 246-5249	Not expected to occur. The site is outside of the species' known elevation range.
Aphanisma blitoides	aphanisma	None/ None/ 1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub/sandy/ annual herb/ Mar-Jun/ 3-1001	Not expected to occur. No suitable habitat present within the proposed project site. Closest CNDDB occurrence is from 1934 approximately 3 miles south of the project site within dry bluffs at Newport Beach (CDFW 2013).
Astragalus pycnostachyus var. *lanosissimus*	Ventura marsh milk-vetch	FE/ SE/ 1B.1	Coastal dunes, Coastal scrub, Marshes and swamps (edges, coastal salt or brackish)/ perennial herb/ Jun-Oct/ 3-115	Not expected to occur. No suitable habitat on site. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Atriplex coulteri	Coulter's saltbush	None/ None/ 1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub, Valley and foothill grassland/alkaline or clay/ perennial herb/ Mar-Oct/ 10-1509	Not expected to occur. This perennial plant would have been observed during the survey if present. Limited suitable grassland habitat present within the proposed project area.
Atriplex pacifica	South Coast saltscale	None/ None/ 1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub, Playas/ annual herb/ Mar-Oct/ 0-459	Not expected to occur. The project site is within the known geographic and elevational range for this species; however, this species is known to occur within coastal bluff scrub and coastal scrub (Jepson Flora 2013; CDFW 2013). Although species occurrences are near the project site, this habitat does not occur on the project site.
Atriplex parishii	Parish's brittlescale	None/ None/ 1B.1	Chenopod scrub, Playas, Vernal pools/alkaline/ annual herb/ Jun-Oct/ 82-6234	Low potential to occur. The project site is within the known geographic and elevational range for this species; however, this species is known to occur within playas, chenopod scrub, and in vernal pools (Jepson Flora 2013; CNPS 2013). Suitable habitat does not occur on the project site.
Atriplex serenana var. *davidsonii*	Davidson's saltscale	None/ None/ 1B.2	Coastal bluff scrub, Coastal scrub/alkaline/ annual herb/ Apr-Oct/ 33-656	Low potential to occur. The project site is within the known geographic and elevational range for this species; however, this species is known to occur within or adjacent to coastal bluff scrub and coastal scrub. The closest known occurrence is approximately 1.75 miles within the Upper Newport Bay Regional Park (Jepson Flora 2013; CDFW 2013). Although species occurrences are near the project site, this habitat does not occur on the project site.

Scientific Name	Common Name	Status (Federal/State/ CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
Calochortus weedii var. *intermedius*	intermediate mariposa lily	None/ None/ 1B.2	Chaparral, Coastal scrub, Valley and foothill grassland/rocky, calcareous/ perennial bulbiferous herb/ May-Jul/ 344-2805	Not expected to occur. The site is outside of the species' known elevation range and the limited grassland habitat within the proposed project area is disturbed. The soils on site are not suitable (e.g., rocky or calcareous).
Camissoniopsis lewisii	Lewis' evening-primrose	None/ None/ 3	Coastal bluff scrub, Cismontane woodland, Coastal dunes, Coastal scrub, Valley and foothill grassland/sandy or clay/ annual herb/ Mar-May(Jun),/ 0-984	Low potential to occur. The project site is within the known geographic and elevational range for this species. The closest known occurrence dates back to 1932 and is approximately 4.75 miles south of the project site within Peninsula Park (Jepson Flora 2013). Although species occurrences are near the project site, grassland habitat is extremely limited and disturbed within the project site.
Centromadia parryi ssp. *australis*	southern tarplant	None/ None/ 1B.1	Marshes and swamps (margins), Valley and foothill grassland (vernally mesic), Vernal pools/ annual herb/ May-Nov/ 0-1394	Low potential to occur. Project site is within known geographic and elevational range for species, and the project site is located within 5 miles of known occurrences of the species (Jepson Flora 2013; CNDDB 2013). This species occurs within and immediately adjacent to salt marshes, floodplains, wetlands, and waterways (Jepson Flora 2013; CNDDB 2013). Although there are species occurrences observed near the project site, no mesic habitat exists on site; therefore, potential to occur is low.
Chaenactis glabriuscula var. *orcuttiana*	Orcutt's pincushion	None/ None/ 1B.1	Coastal bluff scrub (sandy), Coastal dunes/ annual herb/ Jan-Aug/ 0-328	Not expected to occur. Project site within known geographical and elevational range for this species; however, this species is known to occur within or adjacent to coastal bluff scrub and coastal. This habitat does not occur on the project site. Additionally, the closest known occurrence is approximately 12 miles southeast of the project site in Laguna Beach along the coastline (Jepson Flora 2013; CNDDB 2013).

Scientific Name	Common Name	Status (Federal/State/ CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
Chloropyron maritimum ssp. *maritimum*	salt marsh bird's-beak	FE/ SE/ 1B.2	Coastal dunes, Marshes and swamps (coastal salt)/ annual herb hemiparasitic/ May-Oct/ 0-98	Not expected to occur. This species is associated with coastal dunes and marshes. This habitat is not present within the project site. Closest occurrence is approximately 3 miles southeast of the project site within coastal salt marsh at the Upper Newport Bay Ecological Reserve (CDFW 2013). Although the project site is located within known geographical and elevational range, the habitat on site is not mesic.
Chorizanthe parryi var. *fernandina*	San Fernando Valley spineflower	FC/ SE/ 1B.1	Coastal scrub(sandy), Valley and foothill grassland/ annual herb/ Apr-Jul/ 492-4003	Not expected to occur. The site is outside of the species' known elevation range and the limited grassland vegetation present is disturbed.
Comarostaphylis diversifolia ssp. *diversifolia*	summer holly	None/ None/ 1B.2	Chaparral, Cismontane woodland/ perennial evergreen shrub/ Apr-Jun/ 98-2592	Low potential to occur. This perennial plant would have been observed during the survey if present. Closest known occurrence is approximately 17 miles southeast of the proposed project site within Moulton Meadows Park (Jepson Flora 2013). Low potential to occur onsite unless planted as an ornamental.
Dudleya multicaulis	many-stemmed dudleya	None/ None/ 1B.2	Chaparral, Coastal scrub, Valley and foothill grassland/often clay/ perennial herb/ Apr-Jul/ 49-2592	Not expected to occur. The limited grassland vegetation on site is ruderal. This perennial plant would have been observed during the survey if present.
Dudleya stolonifera	Laguna Beach dudleya	FT/ ST/ 1B.1	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland/rocky/ perennial stoloniferous herb/ May-Jul/ 33-853	Not expected to occur. The limited grassland vegetation on site is ruderal. This perennial plant would have been observed during the survey if present.
Eriastrum densifolium ssp. *sanctorum*	Santa Ana River woollystar	FE/ SE/ 1B.1	Chaparral, Coastal scrub(alluvial fan)/sandy or gravelly/ perennial herb/ Apr-Sep/ 299-2001	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Eryngium aristulatum var. *parishii*	San Diego button-celery	FE/ SE/ 1B.1	Coastal scrub, Valley and foothill grassland, Vernal pools/mesic/ annual/perennial herb/ Apr-Jun/ 66-2034	Not expected to occur. The project site is outside of the geographic range for this species. This perennial plant would have been observed during the survey if present. Mesic habitat does not occur within the proposed project area.
Euphorbia misera	cliff spurge	None/ None/ 2.2	Coastal bluff scrub, Coastal scrub, Mojavean desert scrub/rocky/ perennial shrub/ Dec-Aug/ 33-	Not expected to occur. This perennial plant would have been observed during the survey if present.

Scientific Name	Common Name	Status (Federal/State/ CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
			1640	
Helianthus nuttallii ssp. *parishii*	Los Angeles sunflower	None/ None/ 1A	Marshes and swamps (coastal salt and freshwater)/ perennial rhizomatous herb/ Aug-Oct/ 33-5495	Low potential to occur. Project site within known elevational range of species, and the project site is located within 5 miles of known occurrences of this species. Jepson Flora (2013) shows this species as occurring within coastal plains and basins within Newport Lagoon and the Los Angeles Basin. Although species is near project site, suitable habitat (e.g., marshes and swamps) does not occur within the project site, thus low potential for occurrence.
Hordeum intercedens	vernal barley	None/ None/ 3.2	Coastal dunes, Coastal scrub, Valley and foothill grassland (saline flats and depressions), Vernal pools/ annual herb/ Mar-Jun/ 16-3281	Low potential to occur. Project site within known elevational range of species. The closest known occurrence is near Corona del Mar, approximately 6 miles southeast of the proposed project (Jepson Flora 2013). Jepson (2013) shows this species as occurring within vernal pools, dry, saline streambeds and alkaline flats Although species is near the project site, suitable habitat (e.g., coastal scrub and vernal pools) does not occur within the project site, thus low potential for occurrence.
Horkelia cuneata var. *puberula*	mesa horkelia	None/ None/ 1B.1	Chaparral(maritime), Cismontane woodland, Coastal scrub/sandy or gravelly/ perennial herb/ Feb-Jul(Sep),/ 230-2657	Not expected to occur. The site is outside of the species' known elevation range and there is no suitable vegetation present.
Isocoma menziesii var. *decumbens*	decumbent goldenbush	None/ None/ 1B.2	Chaparral, Coastal scrub (sandy, often in disturbed areas)/ perennial shrub/ Apr-Nov/ 33-443	Low potential to occur. This perennial plant would have been observed during the survey if present. There is a single occurrence documented for this species within coastal bluffs of the Pacific Ocean drainage area, dating back to 1946 (Jepson Flora 2013). Suitable habitat is not present within the project area.

Scientific Name	Common Name	Status (Federal/State/ CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
Lasthenia glabrata ssp. *coulteri*	Coulter's goldfields	None/ None/ 1B.1	Marshes and swamps (coastal salt), Playas, Vernal pools/ annual herb/ Feb-Jun/ 3-4003	Low potential to occur. This species is associated with alkali flats typical of marshes and swamps, playas, and vernal pools. Suitable soils and habitat are not present within the project site. A species occurrence dating back to 1965 overlaps with the proposed project site, and is now thought to be extirpated due to development in the area (CDFW 2013). Although the project site is located within the species' known geographical and elevational range, there is no suitable habitat on site; therefore, potential for occurrence is low.
Lepidium virginicum var. *robinsonii*	Robinson's pepper-grass	None/ None/ 1B.2	Chaparral, Coastal scrub/ annual herb/ Jan-Jul/ 3-2904	Low potential to occur. Project site within known elevational range of species. The closest known occurrence is within an open space preserve near UC Irvine, approximately 4.3 miles southeast of the proposed project (Jepson Flora 2013; CDFW 2013). Jepson (2013) shows this species as occurring within coastal sage scrub. Although this species has been recorded near the project site, suitable habitat (e.g., coastal scrub) does not occur within the project site, thus low potential for occurrence.
Nama stenocarpum	mud nama	None/ None/ 2.2	Marshes and swamps (lake margins, riverbanks)/ annual/perennial herb/ Jan-Jul/ 16-1640	Low potential to occur. This species is associated with marshes and swamps. There is a species occurrence within dry vernal pool habitat found in 1936 at Fairview Park, a quarter mile southwest of the proposed project site (CDFW 2013). Although the project site is located within the species' known geographical and elevational range, the habitat on site is not appropriate; therefore, potential for occurrence is low.
Nasturtium gambelii	Gambel's water cress	FE/ ST/ 1B.1	Marshes and swamps(freshwater or brackish)/ perennial rhizomatous herb/ Apr-Oct/ 16-1083	Not expected to occur. This perennial plant would have been observed during the survey if present. No suitable marsh or swamp vegetation present.

Scientific Name	Common Name	Status (Federal/State/ CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
Navarretia prostrata	prostrate vernal pool navarretia	None/ None/ 1B.1	Coastal scrub, Meadows and seeps, Valley and foothill grassland (alkaline), Vernal pools/Mesic/ annual herb/ Apr-Jul/ 49-3970	Low potential to occur. This species is associated with vernal pools and moist environments. There is a species occurrence associated with the bottom of a vernal pool at Fairview Park, approximately 2 miles southwest of the proposed project site (CDFW 2013). Although the project site is located within the species' known geographical and elevational range, suitable mesic habitat (e.g., coastal scrub or meadows and seeps) does not occur within the project site, thus low potential for occurrence.
Nemacaulis denudata var. *denudata*	coast woolly-heads	None/ None/ 1B.2	Coastal dunes/ annual herb/ Apr-Sep/ 0-328	Not expected to occur. No suitable coastal dune habitat present within the project area. All species occurrences are documented along the coastline.
Orcuttia californica	California Orcutt grass	FE/ SE/ 1B.1	Vernal pools/ annual herb/ Apr-Aug/ 49-2165	Not expected to occur. This species is associated with vernal pools and is outside of the known geographical range of the species (approximately 30 miles northwest of project site) (Jepson 2013).
Pentachaeta aurea ssp. *allenii*	Allen's pentachaeta	None/ None/ 1B.1	Coastal scrub (openings), Valley and foothill grassland/ annual herb/ Mar-Jun/ 246-1706	Not expected to occur. The site is outside of the species' known elevation range.
Phacelia ramosissima var. *austrolitoralis*	south coast branching phacelia	None/ None/ 3.2	Chaparral, Coastal dunes, Coastal scrub, Marshes and swamps(coastal salt)/sandy, sometimes rocky/ perennial herb/ Mar-Aug/ 16-984	Low potential to occur. Project site within known elevational range of species. Species associated with alluvial soils; therefore, suitable soils present on site; however there is no suitable vegetation (e.g., chaparral, coastal dunes, coastal scrub, or coastal salt marsh). The closest known occurrence is near Newport Bay, approximately 2 miles southeast of the proposed project (Jepson Flora 2013). This perennial plant would have been observed during the survey if present.
Quercus dumosa	Nuttall's scrub oak	None/ None/ 1B.1	Closed-cone coniferous forest, Chaparral, Coastal scrub/sandy, clay loam/ perennial evergreen shrub/ Feb-Apr(Aug),/ 49-1312	Not expected to occur. No suitable habitat (e.g., coniferous forest, chaparral, or coastal scrub) present on the proposed project site. This perennial evergreen shrub would have been observed during the survey if present.

Scientific Name	Common Name	Status (Federal/State/ CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
Sagittaria sanfordii	Sanford's arrowhead	None/ None/ 1B.2	Marshes and swamps(assorted shallow freshwater)/ perennial rhizomatous herb emergent/ May-Oct/ 0-2133	Not expected to occur. This species is associated with shallow freshwater marshes and swamps, which do not occur on site, and is outside of the known geographical range of the species (approximately 30 miles northeast of project site) (Jepson 2013).
Senecio aphanactis	chaparral ragwort	None/ None/ 2.2	Chaparral, cismontane woodland, coastal scrub/sometimes alkaline/ annual herb/ Jan-Apr/ 49-2625	Low potential to occur. The project site is within the known elevational range of species. Species associated with alkaline soils which are present on site; however, there is no suitable vegetation present within the proposed project area. The closest known occurrence is within the UC Irvine Ecological Reserve, approximately 4.6 miles southeast of the proposed project (Jepson Flora 2013).
Sidalcea neomexicana	salt spring checkerbloom	None/ None/ 2.2	Alkali playas, brackish marshes, chaparral, coastal scrub, lower montane coniferous forest, Mojavean desert scrub/alkaline, mesic/ perennial herb/ Mar-Jun/ 49-5020	Low potential to occur. This species is generally associated with mesic, alkaline areas in playas, marshes, chaparral, coastal scrub, lower montane coniferous forest, and Mojavean desert scrub, which do not occur on site. Although the project site is located within the species' known geographical and elevational range, there is no suitable habitat on site; therefore, potential for occurrence is low.
Suaeda californica	California seablite	FE/ None/ 1B.1	Marshes and swamps (coastal salt)/ perennial evergreen shrub/ Jul-Oct/ 0-49	Not expected to occur. This species is associated with marshes and swamps. Suitable habitat not present within the proposed project site. This perennial evergreen shrub would have been observed during the survey if present.
Suaeda esteroa	estuary seablite	None/ None/ 1B.2	Marshes and swamps(coastal salt)/ perennial herb/ May-Oct(Jan),/ 0-16	Not expected to occur. This species is associated with marshes and swamps. Suitable habitat not present within the proposed project site. This perennial herb would have been observed during the survey if present.

Scientific Name	Common Name	Status (Federal/State/ CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Potential to Occur
Symphyotrichum defoliatum	San Bernardino aster	None/ None/ 1B.2	Cismontane woodland, coastal scrub, Lower montane coniferous forest, Meadows and seeps, Marshes and swamps, Valley and foothill grassland(vernally mesic) /near ditches, streams, springs/ perennial rhizomatous herb/ Jul-Nov/ 7-6693	Low potential to occur. This species is associated with ditches, streams, and springs. Suitable habitat not present within the proposed project site. The closest known extant occurrence was documented in 1933 within Upper Newport Bay Regional Park (CDFW 2013). Although the project site is within the species' known elevational range, no suitable water sources exist within the project area.
Verbesina dissita	big-leaved crownbeard	FT/ ST/ 1B.1	Chaparral(maritime), Coastal scrub/ perennial herb/ Apr-Jul/ 148-673	Not expected to occur. Elevation range on site is between 50 to 70 feet above mean seal level (AMSL) and is well outside of the species' known elevation range. Additionally, no suitable chaparral or coastal scrub on the proposed project site.

APPENDIX C

Matrix of Wildlife Species and Potential to Occur

APPENDIX C
Matrix of Special-Status Wildlife Species and Potential to Occur

Scientific Name	Common Name	Status Federal/State	Primary Habitat Associations	Potential to Occur
		Amphibians		
Spea [=*Scaphiopus*] *hammondi*	Western spadefoot	None/ CSC	Most common in grasslands, coastal sage scrub near rain pools or vernal pools; riparian habitat	Absent. No suitable water sources within the project area. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
		Reptiles		
Actinemys [=*Emys*] *marmorata pallida*	Southwestern pond turtle	None/ CSC	Slow-moving permanent or intermittent streams, ponds, small lakes, reservoirs with emergent basking sites; adjacent uplands used during winter	Low. Project area lacks suitable water source and aquatic habitat required by this species. CNDDB occurrence within 5 miles of proposed project site (CDFW 2013).
Aspidoscelis hyperythra [=*Cnemidophorus hyperythrus*]	Orange-throated whiptail	None/ CSC	Coastal sage scrub, chaparral, grassland, juniper and oak woodland	Absent. Lack of suitable habitat within the proposed project area and adjacent areas. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Charina [Lichanura] trivirgata rosseofusca	Coastal rosy boa	None/ None	Rocky chaparral, coastal sage scrub, oak woodlands, desert and semi-desert scrub; common in riparian areas	Absent. Lack of suitable habitat within the proposed project area and adjacent areas. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Chelonia mydas	Green turtle	FT/None	Warm marine waters near shorelines such as lagoons and bays with beds of eelgrass and seaweed;nests on sandy beaches	Absent. Lack of suitable habitat within the proposed project area. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Crotalus ruber ruber	Northern red-diamond rattlesnake	None/ CSC	Variety of shrub habitats where there is heavy brush, large rocks, or boulders	Low. Limited suitable habitat present within the project site. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Phrynosoma coronatum (*blainvillei* population)	Coast (San Diego) horned lizard	None/ CSC	Coastal sage scrub, annual grassland, chaparral, oak and riparian woodland, coniferous forest	Absent. No suitable habitat present within the project site. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).

Scientific Name	Common Name	Status Federal/State	Primary Habitat Associations	Potential to Occur
Birds				
Accipiter cooperii (nesting)	Cooper's hawk	None/ CSC	Riparian and oak woodlands, montane canyons	Moderate (nesting). Suitable habitat is limited to ornamental trees comprised of pine and eucalyptus on site. This species is known to occur in urban areas. No CNDDB occurrence within 5 miles of the proposed project area (CDFW 2013).
Agelaius tricolor	Tricolored blackbird	BCC, USBC/ CSC	Nests near fresh water, emergent wetland with cattails or tules; forages in grasslands, woodland, agriculture pastures, rice fields, feedlots, dairies , and occasionally riparian scrub and marsh borders	Low. Proposed project site lacks suitable aquatic sources and emergent wetland vegetation required for nesting. Suitable foraging potential within the proposed project area is extremely limited. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Aimophila ruficeps canescens (nesting and foraging)	Southern California rufous-crowned sparrow	None/ CSC	Grass-covered hillsides, coastal sage scrub, chaparral with boulders and outcrops	Low (nesting and foraging). Lack of suitable nesting and foraging habitat within the proposed project site. No CNDDB occurrences within 5 miles of the proposed project site (CDFW2013).
Ammodramus savannarum	Grasshopper sparrow	None/CSC	Dense, dry or well-drained annual and native grasslands with mix of grasses and forbs; fallow agricultural fields	Low. Lack of suitable nesting and foraging habitat within the proposed project site. Closest CNDDB occurrence approximately 3.5 miles southeast of proposed project site within habitat containing coastal sage scrub (CDFW 2013).
Ardea herodias (rookery)	Great blue heron	None/ None	Variety of habitats, but primarily wetlands; lakes, rivers, marshes, mudflats, estuaries, saltmarsh, riparian habitats	Absent. No suitable water sources within the project area. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).

Scientific Name	Common Name	Status Federal/State	Primary Habitat Associations	Potential to Occur
Athene cunicularia (burrow sites)	Burrowing owl	BCC/ CSC	Grassland, lowland scrub, agriculture, coastal dunes and other artificial open areas	Low. No burrows or suitable habitat present to support this species. Species was not observed during the site visit. Closest CNDDB occurrence approximately 1.6 miles southwest of the proposed project site within non-native grasses and mustard 10 feet of the trailhead to Fariview Park (CDFW 2013). Very few burrowing owls are known to occur in Orange County; mostly wintering birds. Project area is developed, with minimal habitat of poor quality. Based on this and the lack of suitable foraging habitat in the project area, this species is unlikely to occur within the project area.
Buteo regalis (wintering)	Ferruginous hawk	BCC/ CSC	Open, dry country, grasslands, open fields, agriculture	Low. Lack of open habitats suitable for wintering within the proposed project site. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Campylorhynchus brunneicapillus sandiegensis	Coastal (San Diego) cactus wren	BCC/ CSC	Southern cactus scrub, maritime succulent scrub, cactus thickets in coastal sage scrub	Absent. Lack of suitable habitat within the proposed project site or adjacent areas No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Charadrius alexandrinus nivosus	Western snowy plover (coastal population)	FT, BCC, USBC/ CSC	Nests primarily on coastal beaches, in flat open areas, with sandy or saline substrates; less commonly in salt pans, dredged spoil disposal sites, dry salt ponds and levees	Absent. Lack of suitable aquatic habitat (e.g., coastal beaches or saline substrates) required for nesting within the proposed project area. CNDDB occurrences just within 5 miles of the proposed project site along Huntington State Beach (CDFW 2013).
Coccyzus americanus occidentalis (nesting)	Western yellow-billed cuckoo	FC, BCC/ SE	Dense, wide riparian woodlands and forest with well-developed understories	Absent. Lack of suitable aquatic habitat required for nesting within the proposed project area. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).

Scientific Name	Common Name	Status Federal/State	Primary Habitat Associations	Potential to Occur
Elanus leucurus (nesting)	White-tailed kite	None/ FP	Open grasslands, savanna-like habitats, agriculture, wetlands, oak woodlands, riparian	Low. Lack of sutiable open grassland habitat for foraging and riparin habitat suitable for nesting within the proposed project site and adjacent areas. Closest CNDDB occurrence approximately 2.5 miles southeast of the proposed project site in the vicinity of Upper Newport Bay Regional Park (CDFW 2013).
Eremophila alpestris actia	California horned lark	None/ CSC	Open habitats, grassland, rangeland, shortgrass prairie, montane meadows, coastal plains, fallow grain fields	Absent. Suitable open habitats required for nesting and foraging not present within the proposed project site or within adjacent areas. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Icteria virens (nesting)	Yellow-breasted chat	None/ CSC	Dense, relatively wide riparian woodlands and thickets of willows, vine tangles and dense brush.	Absent. Suitable aquatic habitat (e.g., riparian woodlands) required for nesting and foraging not present within the proposed project site or adjacent areas. Closest CNDDB occurrence approximately 3.8 miles southeast of the proposed project site within riparian scrub dominated by willow trees (CDFW 2013).
Laterallus jamaicensis coturniculus	California black rail	ST, BCC, USBC/ FP	Saline, brackish, and fresh emergent wetlands	Absent. Suitable aquatic habitat required for nesting and foraging not present within the proposed project site or adjacent areas. CNDDB occurrences within 5 miles of the proposed project site, with the closest occurrence within southern coastal salt marsh habitat at Upper Newport Bay Regional Park approximately 1.8 miles southeast of the project site (CDFW 2013).
Pandion haliaetus (nesting)	Osprey	None/ CSC	Large waters (lakes, reservoirs, rivers) supporting fish; usually near forest habitats, but widely observed along the coast	Absent. Suitable aquatic habitat required for nesting and foraging not present within the proposed project site or adjacent areas. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).

Scientific Name	Common Name	Status Federal/State	Primary Habitat Associations	Potential to Occur
Passerculus sandwichensis beldingi	Belding's savannah sparrow	None/ SE	Saltmarsh, pickleweed	Absent. Suitable aquatic wetland habitat required for nesting and foraging not present within the proposed project site or adjacent areas. CNDDB occurrence just within 5 miles of the proposed project site within a Newport slough area near the mouth of the Santa Ana River (CDFW 2013).
Polioptila californica californica	Coastal California gnatcatcher	FT, USBC/ CSC	Coastal sage scrub, coastal sage scrub-chaparral mix, coastal sage scrub-grassland ecotone, riparian in late summer	Low. Suitable habitat (e.g., coastal sage scrub) required for nesting and foraging not present within the proposed project site or adjacent areas. Closest CNDDB occurrence is approximately 1.75 miles southeast of the project site, just north of Upper Newport Bay Regional Park. (CDFW 2013).
Rallus longirostris levipes	Light-footed clapper rail	FE, USBC/ SE, P	Coastal saltmarsh	Absent. Suitable coastal saltmarsh habitat not present within the proposed project site or adjacent areas. CNDDB occurrences within 5 miles of the proposed project site, with the closest occurrence within southern coastal salt marsh habitat at Upper Newport Bay Regional Park approximately 1.8 miles southeast of the project site (CDFW 2013).
Riparia riparia (nesting)	Bank swallow	None/ ST	Typically occur along rivers, lakes, oceans, stream, and reservoirs with vertical banks or cliffs; nest in lowland country with soft banks or bluffs; mostly forage over water in riparian areas, various aquatic habitats, and wet croplads, occassionaly forage in neighboring brush	Low. Lack of suitable aquatic habitats required for nesting and foraging within the proposed project area. CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Rynchops niger (wintering)	Black skimmer	WL/CSC	Alkali playa; sand shore; beaches; estuarine sand bars	Absent. Suitable habitat not present within the proposed project area. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).

Scientific Name	Common Name	Status Federal/State	Primary Habitat Associations	Potential to Occur
Sterna antillarum browni (nesting colony)	California least tern	FE, USBC/ SE,F P	Nests along the coast from San Francisco Bay south to northern Baja California	Low. Suitable habitat not present within the proposed project area. Closest CNDDB occurrence approximately 2.65 miles southeast of the proposed project site within Upper Newport Bay Ecological Reserve (CDFW 2013).
Vireo bellii pusillus (nesting)	Least Bell's vireo	FE, BCC, USBC/ SE	Nests in southern willow scrub with dense cover within 1-2 meters of the ground; habitat includes willows, cottonwoods, baccharis, wild blackberry or mesquite on desert areas	Low. Suitable aquatic habitat not present within the proposed project area or adjacent areas. CNDDB occurrences just within 5 miles of the proposed project site near the Bonita Canyon Reservoir Dam in Newport Beach (CDFW 2013).
Mammals				
Choeronycteris mexicana	Mexican long-tongued bat	None/ CSC	Desert and montane riparian, desert succulent scrub, desert scrub, and pinyon-juniper woodland; roosts in caves, mines, and buildings	Low. Lack of suitable foraging habitat present within the proposed project site. CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Eumops perotis californicus	Western mastiff bat	None/ CSC	Open, semi-arid to arid habitats including, conifer and deciduous woodland, coastal scrub, annual and perennial grasslands, palm oases, chaparral, desert scrub, and urban; prefer low elevations in the coastal basins of southern California; generally roost in small colonies in cracks and small holes within rugged, rocky areas, also roost within man-made structures	Low. No suitable foraging habitat within the proposed project site. CNDDB occurrences within 5 miles of the proposed project site, with the closest CNDDB occurrence approximately 2.75 miles east of the proposed project site within the San Joaquin Reserve (CDFW 2013).
Lasionycteris noctivagans	Silver-haired bat	None/ SA	Coastal & montane forest, roosts in hollow trees, beneath exfoliating bark, abandoned woodpecker holes, and rarely under rocks.	Low. Roost in cavities of living or dead trees. Suitable habitat not present within the proposed project site. CNDDB occurrences within 5 miles of the proposed project (CDFW 2013).

Scientific Name	Common Name	Status Federal/State	Primary Habitat Associations	Potential to Occur
Lasiurus cinereus	Hoary bat	None/ SA	Broad-leaved upland forest, cismontane woodland, lower montane coniferous forest, and north coast coniferous forest; usually roost at edge of coniferous and deciduous tree clearings; less commonly roost in cavities, caves, or man-made structures	Low. Suitable roosting habitat (e.g., trees) present within the proposed project site, but this species is seldomly found in urban settings. CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013). Closest CNDDB occurrence is 3.8 miles south of the project site adjacent to Newport Harbor (CDFW 2013).
Lasiurus xanthinus	Western yellow bat	None/ SA	Desert and montane riparian, desert succulent scrub, desert scrub, and pinyon-juniper woodland; roosts in trees,particularly palms within urban areas ; forages over water and among trees	Low. Suitable roosting habitat (e.g., palm trees) present within the proposed project site. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Microtus californicus stephensi	South coast marsh vole	None/CSC	Tidal marshes in Los Angeles, Orange, and Ventura Counties.	Absent. Suitable habitat (e.g., tidal marshes) not present within the proposed project area or adjacent areas. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Myotis yumanensis	Yuma myotis	None/ SA	Closely tied to open water which is used for foraging; open forests and woodlands are optimal habitat; roosts in natural and artificial structures (caves, mines, trees, bridges, and buildings)	Moderate. Suitable roosting habitat (e.g., buildings and trees) and known to occur within urban areas. Open waters required for foraging not present within the proposed project site. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Nyctinomops macrotis	Big free-tailed bat	None/ CSC	Rugged, rocky canyons; roosts in crevices of high cliffs, outcroppings, buildings, caves, and occasionally in tree cavities	Low. Suitable roosting habitat (e.g., buildings) present within proposed project site, but prefer rugged, rocky terrain not present within the project site. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Perognathus longimembris pacificus	Pacific pocket mouse	FE/ CSC	Grassland, coastal sage scrub with sandy soils; along immediate coast	Absent. Suitable habitat and soils not present withn the proposed project site. Only three known occurrences of this species. Species is common within the immediate vicinity of the Pacific Ocean, within one mile of the coast. The proposed project site is approximately 4.75 miles from the coastline. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).

Scientific Name	Common Name	Status Federal/State	Primary Habitat Associations	Potential to Occur
Sorex ornatus salicornicus	Southern California saltmarsh shrew	None/ CSC	Coastal marshes and Valley foothill and montane riparian optimal (prefers moist soil); also woodland, chaparral, grassland, and emergent wetland. Nests in wood, shrubs, and burrows.	Low. Suitable habitat (e.g., shrubs or burrows) not present within the proposed project site. Closest CNDDB occurrence is approximately 1.3 miles south of the proposed project site within the vicinity of the Newport Lagoon (CDFW 2013).
Taxidea taxus	American badger	None/ CSC	Dry, open treeless areas, grasslands, coastal sage scrub	Low. Limited and fragmented suitable habitat within the proposed project site. Closest CNDDB occurrence approximately 3.5 miles southwest of the proposed project site within the vicinity of disturbed non-native grassland habitat in Newport Beach (CDFW 2013). Individual was identified dead in the road.
Invertebrates				
Branchinecta sandiegonensis	San Diego fairy shrimp	FE/ None	Small, shallow vernal pools, occasionally ditches and road ruts	Low. The proposed project site is mostly developed. Soils are well drained with minimal potential for ponding or pooling water on site. Closest CNDDB occurrence approximately 1.8 miles west of the proposed project site within vernal pool habitat (CDFW 2013).
Cicindela gabbii	Gabb's tiger beetle	None/ SA	Estuaries and mudflats; generally on dark-colored mud; occasional on dry saline flats of estuaries.	Absent. Suitable habitat (e.g., estuaries) not present within the proposed project area or adjacent areas. Closest CNDDB occurrence approximately 4 miles south of the proposed project site along Newport Beach (CDFW 2013).
Cicindela hirticollis gravida	Sandy beach tiger beetle	None/ SA	Sandy areas adjacent to non-brackish water along California coast; found in dry sand in upper zone	Absent. Suitable habitat (e.g., non-brackish waters and sands) not present within the proposed project area or adjacent areas. CNDDB occurrences just within 5 miles of the proposed project site along Newport Beach (CDFW 2013).
Cicindela latesignata latesignata	Western beach tiger beetle	None/ SA	Estuary, mud shore/flats	Absent. Suitable habitat not present within the proposed project area or adjacent areas. Closest CNDDB occurrence approximately 4 miles south of the proposed project site along Newport Beach (CDFW 2013).

Scientific Name	Common Name	Status Federal/State	Primary Habitat Associations	Potential to Occur
Cicindela senilis frosti	Tiger beetle	None/ SA	Salt marshes	Absent. Suitable habitat not present within the proposed project area or adjacent areas. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Coelus globosus	Globose dune beetle	None/ SA	Coastal dunes	Absent. Suitable habitat not present within the proposed project area or adjacent areas. Closest CNDDB occurrence approximately 4 miles south of the proposed project site along Newport Beach (CDFW 2013).
Danaus plexippus (wintering sites)	Monarch butterfly	None/ SA	Overwinters in eucalyptus groves	Moderate. *Eucalyptus* spp. observed throughout the proposed project site could provide wintering habitat; however, this species was not observed during the site visit. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Panoquina errans	Wandering (= saltmarsh) skipper	None/ SA	Salt marsh from Los Angeles to Baja, Mexico	Low. Suitable habitat not present within the proposed project site. CNDDB occurrences just within 5 miles of the proposed project site within wetland and salt marsh habitats along Huntington Beach (CDFW 2013).
Trigonoscuta dorothea dorothea	Dorothy's El Segundo Dune weevil	None/ SA	Coastal dunes	Absent. Suitable habitat not present within the proposed project site. No CNDDB occurrences within 5 miles of the proposed project site (CDFW 2013).
Tryonia imitator	Mimic tryonia, California brackishwater snail	None/ SA	Coastal lagoons, estuaries and salt marshes	Absent. Suitable aquatic habitat not present within the proposed project site. Closest CNDDB occurrence approximately 1.75 miles southeast of the proposed project site within an outlet of San Diego Creek (CDFW 2013).

Scientific Name	Common Name	Status Federal/State	Primary Habitat Associations	Potential to Occur
		Fish		
Catostomus santaanae	Santa Ana sucker	FT/ CSC	Small, shallow, cool, clear streams less than 7 meters in width and a few centimeters to more than a meter in depth; substrates are generally coarse gravel, rubble and boulder	Absent. No suitable water sources within the proposed project site.
Eucyclogobius newberryi	Tidewater goby	FE/ CSC	Low-salinity waters in coastal wetlands	Absent. No suitable water sources within the proposed project site.

Federal Designations:

- BCC Fish and Wildlife Service: Birds of Conservation Concern
- FC Candidate for federal listing as threatened or endangered
- (FD) Federally-delisted; monitored for five years
- FE Federally-listed Endangered
- FT Federally-listed as Threatened
- MNBMC Fish and Wildlife Service Migratory Nongame Birds of Management Concern
- USBC United States Bird Conservation Watch List

State Designations:

- CSC California Special Concern Species
- FP California Department of Fish and Game Protected and Fully Protected Species
- SA Special Animal List
- SE State-listed as Endangered
- ST State-listed as Threatened
- WL State Watch List Species

Subject: Negative Phase I Findings for the CCCD Vision 2020 Plan, Orange Coast College Project, Orange County, CA

Dear Mr. Marchbank:

This letter documents the negative Phase I cultural resources inventory conducted by Dudek for the CCCD Vision 2020 Plan, Orange Coast College Project (Project), located in the City of Costa Mesa, Orange County (Figure 1). The Project proposes select replacement and general renovations of existing college buildings, parking areas, and access roads. A South Central Coastal Information Center (SCCIC) records search indicates that no cultural resources have been recorded in the proposed project area. A Native American Heritage Commission (NAHC) Sacred Lands File (SLF) search and subsequent correspondence with tribal representatives does not suggest the presence of any sacred sites, traditional cultural properties (TCPs), or areas of stated cultural community importance. Cultural pedestrian survey was conducted of the study area in accordance with the standards and guidelines defined by the California Environmental Quality Act (CEQA). No cultural resources were identified.

PROJECT DESCRIPTION AND LOCATION

The Coast Community College District (CCCD) is proposing construction of new facilities and renovations of existing facilities on the Orange Coast College (OCC) campus as a part of the CCCD Vision 2020 Facilities Master Plan (Project). Project components will include the replacement of several buildings with larger facilities, the renovation and expansion of some existing facilities, the reconfiguration or expansion of existing parking lots, and the completion of a Loop Road for automobile traffic in addition to pedestrian circulation enhancements. The project is situated north of Merrimac Way, south of Adams Avenue, and west of Fairview Road (Figure 1). The area of potential effect falls within Sections 2, 3, 4, 9, 10, and 11 of the Newport Beach, USGS Quadrangles (Township 16S; Range 10W).

REGULATORY FRAMEWORK

CEQA requires that all private and public activities not specifically exempted be evaluated for the potential to impact the environment, including effects to historical resources. Historical resources are recognized as part of the environment under CEQA. It defines historical resources as "any object, building, structure, site, area, or place, which is historically significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (Division I, Public Resources Code, Section 5021.1(b)).

Lead agencies have a responsibility to evaluate historical resources against the California Register criteria prior to making a finding as to a proposed project's impacts to historical resources. Mitigation of adverse impacts is required if the proposed project will cause substantial adverse change. Substantial adverse change includes demolition, destruction, relocation, or alteration such that the significance of an historical resource would be impaired. While demolition and destruction are fairly obvious significant impacts, it is more difficult to assess when change, alteration, or relocation crosses the threshold of substantial adverse change. The CEQA Guidelines provide that a project that demolishes or alters those physical characteristics of an historical resource that convey its historical significance (i.e., its character-defining features) can be considered to materially impair the resource's significance.

The California Register is used in the consideration of historic resources relative to significance for purposes of CEQA. The California Register includes resources listed in, or formally determined eligible for some California State Landmarks and Points of Historical Interest. Properties of local significance that have been designated under a local preservation ordinance (local landmarks or landmark districts), or that have been identified in a local historical resources inventory may be eligible for listing in the California Register and are presumed to be significant resources for purposes of CEQA unless a preponderance of evidence indicates otherwise.

Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the California Register of Historical Resources (Pub. Res. Code SS5024.1, Title 14 CCR, Section 4852) consisting of the following:

1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States; or
2. It is associated with the lives of persons important to local, California, or national history; or
3. It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master, or possesses high artistic values; or

4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

SCIC RECORDS SEARCH

A records search for the proposed project area and a surrounding half-mile was completed by SCCIC staff on August 26, 2013 (Appendix A). This search included their collection of mapped prehistoric, historical and built-environment resources, Department of Parks and Recreation (DPR) Site Records, technical reports, archival resources, and ethnographic references. Additional consulted sources included the National Register of Historic Places (NRHP), California Inventory of Historical Resources/CRHR and listed OHP Archaeological Determinations of Eligibility, California Points of Historical Interest, California Historical Landmarks, and Caltrans Bridge Survey information.

Previously Conducted Studies:

SCCIC records indicate that nine previous cultural resources investigations have been conducted within a half-mile of the proposed project area. Of these, two studies have included eastern portions of the OCC campus (Table 1).

Table 1. Studies that have included project area

Author	Year	Company	Title
Leonard, Nelson N	1975	University of California Riverside	Environmental Impact Evaluation: Route Alternatives Between the Michelson Treatment Plant and Plants on the Santa Ana River, Orange County, CA. Report on file at the South Central Coastal Information Center, CSU Fullerton.
Demcak, Carol R.	1999	Archaeological Resource Management Corp.	Cultural Resources Assessment for Orange County Sanitation Districts. Report on file at the South Central Coastal Information Center, CSU Fullerton.

Previously Identified Cultural Resources:

SCCIC records indicate that no cultural resources have been previously identified within the proposed project area. Five above-ground historic resources (30-162281, 30-176872, 30-706873, 30-176874, and 30-179852) have been previously identified within a half-mile radius of the OCC campus (Appendix A). Five of these resources have been determined ineligible for listing in the NRHP, however, they have not been formally evaluated for CRHR listing. One resource, previously identified as a Point of Historical Interest, has been determined to require reevaluation. The SCCIC records search provided copies of three historic maps (map series). The 1945 USGS 7.5' Santa Ana Quadrangle and a 1896 regional topographic survey map do not suggest that any historical period resources are present within the current project area. A formal historical inventory is currently being conducted for the Project area; these results are pending and will be provided as part of a separate study.

NAHC SACRED LANDS FILE SEARCH

DUDEK requested a NAHC search of their Sacred Lands File on September 4, 2013 for the proposed project area. The NAHC provided results the two days later. This search did not indicate the presence of Native American traditional cultural place(s) within this area, or the surrounding one-mile buffer (Appendix B). The NAHC additionally provided a list of Native American tribes and individuals/organizations that might have knowledge of cultural resources in or near the project area.

TRIBAL REPRESENTATIVE CORRESPONDENCE

Following the NAHC response, letters were sent to the listed tribal representatives with the intent of requesting information, opinions or concerns relating to the proposed project impacts (Appendix B). These letters contained a brief description of the planned project, reference maps, and a summary of the NAHC SLF search results. Andy Salas, Chairman of the Gabrieleno Band of Mission Indians/Kizh Nation, responded on September 20, 2013. Mr. Salas' e-mail response indicated that their tribe has knowledge of a named Native American village (Lopuuknga) location near the proposed project. As such, Mr. Salas requests that a Native American monitor from this tribe be present during all ground disturbances. There has been no additional correspondence with Native American representatives to date.

METHODS

Intensive Pedestrian Survey

The intensive pedestrian survey was conducted by Dudek archaeologist Nicholas Hanten on September 10, 2013 using standard archaeological procedures and techniques. All field practices met the Secretary of Interior's standards and guidelines for cultural resources inventory. In areas that were not constrained by the presence of structures, vehicles, and other obstacles.

No artifacts or archaeological features were identified within the proposed project area. Visibility was variable, allowing for nearly all of the ground to be observed along exposed areas and less than 5 percent visibility in areas obscured by pavement or grasses. Portions of the project area have been previously disturbed by mechanical grading, landscaping, road construction, drainage control, and general development. It is somewhat unclear as to the depth and character of past disturbances within some of these areas, however, it is evident that it has been substantial.

SUMMARY AND MANAGEMENT CONSIDERATIONS

Archaeological Sensitivity and Mitigation Measures

Dudek's Phase I cultural resources inventory of the project area suggests that there is low potential for the inadvertent discovery of cultural resources during ground breaking activities. The area has been highly disturbed by past modifications to the campus. The NAHC Sacred Lands File search did not indicate that cultural resources are in the vicinity of the project. Subsequent tribal correspondence suggests that there is a documented village location near by, however, SCCIC records indicate that no archaeological investigations have been conducted at a resource of this name within a half-mile of the OCC campus. A map provided by Mr. Salas, Chairman of the Gabrieleno Band of Mission Indians/Kizh Nation, suggests that this village is located west of the Santa Ana River, located approximately 1.3 miles west of the project area. In reviewing this map, the scale is relatively small (zoomed-out), this has likely resulted in the village appearing nearer to the project area than it may be. Accounting for modern drainage control that may have shifted the route of this river, it is still likely that the Native American village location more than a mile from the OCC campus.

Due to the highly developed setting of this project, and the lack of evidence for archaeological resources nearer than a half-mile distance, it is recommended that archaeological monitoring is unnecessary during future ground disturbing activities associated with the project. Additional correspondence should be conducted with tribal representatives to determine if Native American monitoring will be required. Should construction or other personnel encounter any historical, archaeological or Native American cultural material within the project area the Lead Agency representative should be notified. In the event that human remains or related cultural material are encountered, Section 15064.5(e) of CEQA requires work to be stopped and the County Coroner notified

Should you have any questions relating to this report and its findings please contact me.

Respectfully Submitted,

1. INTRODUCTION

A. STATEMENT OF PURPOSE

This technical report documents and evaluates potential historic resources that may be affected by the implementation of the Orange Coast College Vision 2020 Facilities Master Plan (the proposed project). Orange Coast College (OCC) is one of three campuses operated by the Coast Community College District (District) within the county of Orange. This report is prepared to facilitate environmental compliance of the proposed project under the provisions of the California Environmental Quality Act (CEQA). The survey assessment includes a discussion of survey methods utilized, the jurisdictional framework for historical resources, a description of the subject property's environmental setting, a brief contextual history of the survey study area, an evaluation assessment of the property for historical significance, an analysis of potential project impacts on identified resources, and recommended mitigation measures for any potential adverse impacts to those resources identified as historically significant.

B. PROJECT LOCATION

The proposed project is located on the existing OCC campus in the City of Costa Mesa, California, within the central portion of Orange County (Figure 1-1, Regional Map). Primary freeway access to the campus is via Interstate 405 and State Routes 55 and 73, which are within minutes of the campus. OCC is bounded by Adams Avenue to the north, Fairview Road to the east, Merrimac Way to the south, and Harbor Boulevard to the west (Figure 1-2, Local Vicinity).

C. PROJECT BACKGROUND AND HISTORY

The District is updating its Facilities Master Plan for all three of its Orange County campuses: Orange Coast College, Golden West College, and Coastline Community College. The Vision 2020 Facilities Master Plan provides an analysis of the evolving student body and makes planning recommendations based on their educational needs. The District is undertaking a comprehensive improvement and building program to meet increasing enrollment and to make the upgrades and repairs of existing buildings as well as to construct new facilities to improve the safety and educational experience of those attending the colleges in accordance with Measure M. Measure M was passed in November 2012 and issued $698 million in bonds to fund the expansion of courses and academic buildings in engineering, math, science, and technology, as well as to upgrade technologies, construct and repair facilities, and improve resources for active military personnel and veterans at all three District campuses.

OCC is proposing to implement the proposed project to more effectively meet the space needs of the projected on-campus enrollment through the year 2020 and beyond while constructing and renovating facilities in order to meet the District's instructional needs. The construction of on-campus housing facilities, parking lot improvements, and construction of a parking structure would accommodate the projected increase in out-of-District students. Improved circulation in and around campus would increase accessibility to existing and new development, improve pedestrian and bicycle safety, and enhance the overall connectivity of campus uses. By pursuing joint venture and entrepreneurial opportunities, the District could generate revenue and support the academic needs and mission of the campus.

The overall goal of the proposed project is to provide the optimal physical settings to support the District's academic mission. The Vision 2020 Facilities Master Plan proposes the development of modern teaching and learning facilities that would attract students to OCC while providing the physical resources necessary to support the educational process.

D. HISTORIC RESOURCES ASSESSMENT METHODOLOGY

In order to identify and assess historic resources, a multi-step methodology was utilized. A record search to identify previously documented historic resources was conducted. This search included a review of the National Register and its annual updates, determinations of eligibility for National Register listings, and the California Historical Resources Inventory database maintained by the State Office of Historic Preservation (OHP).

Site inspections of the project site were made to assess existing conditions, define the historic resources survey study area, document potential significant properties, and identify character-defining features of those properties evaluated as historically significant. A survey of the study area, including photography and the collection of archival background data, was then made. Additional background and site-specific research was conducted in order to evaluate potential historic resources within their proper historic context.

Criteria of the National Register, California Register, and the City of Costa Mesa were employed to assess the significance of the property. In addition, the survey methodology of the OHP was utilized. More specifically, in conducting the identification and evaluation of historic resources located within the study area, the following tasks were performed:

- Searched archival records of the National Register, California Historical Resources Inventory (HRI), and the City of Costa Mesa.
- Conducted field inspections of the study area and photographed the site and its features.

Collected and reviewed relevant historic images and archives including, but not limited to those at Orange Coast College, the Regional History Center at the University of Southern California, the Los Angeles Public Library, the County of Orange archives, and the University of California, Los Angeles.

- Conducted site-specific research on historic resources including a review of relevant architectural plans, building permits, tax assessor records, Sanborn Fire Insurance Maps, and other archival documents.
- Reviewed and analyzed previous documentation, ordinances, statutes, regulations, bulletins, and technical materials relating to federal, state, and local historic preservation, designation assessment processes, and related programs.

This historic resources survey assessment was conducted and prepared by Jan Ostashay, Principal, Ostashay & Associates Consulting, who satisfies the U.S. Secretary of the Interior's Professional Qualification Standards in history and architectural history.

2. REGULATORY FRAMEWORK

Historic resources fall within the jurisdiction of several levels of government. Federal laws provide the framework for the identification, and in certain instances, protection of historic resources. Additionally, states and local jurisdictions play active roles in the identification, documentation, and protection of such resources within their communities.

Numerous laws and regulations require federal, state, and local agencies to consider the effects of a proposed project on historic resources. These laws and regulations stipulate a process for compliance, define the responsibilities of the various agencies proposing or overseeing the action, and prescribe the relationship among other involved agencies (e.g., State Historic Preservation Office and the Advisory Council on Historic Preservation). The National Historic Preservation Act (NHPA) of 1966, as amended; the California Environmental Quality Act (CEQA); the California Register of Historical Resources; Public Resources Code (PRC) 5024; and the City of Costa Mesa (Municipal Code, Title 13, Chapter IX, Article 14, Section 13-200.6-200.59) are the primary federal, state, and local laws governing and affecting preservation of historic resources of national, state, and local significance. A description of these laws and regulations is provided in the following paragraphs.

A. FEDERAL LEVEL

1. NATIONAL REGISTER OF HISTORIC PLACES

First authorized by the Historic Sites Act of 1935, the National Register of Historic Places (National Register) was established by the NHPA, as "an authoritative guide to be used by Federal, State, and local governments, private groups and citizens to identify the Nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment."[1] The National Register recognizes properties that are significant at the national, state and local levels. Further discussion of National Register criteria and guidelines is provided in Section 3, Environmental Setting, of this document.

B. STATE LEVEL

The California Office of Historic Preservation, as an office of the California Department of Parks and Recreation, implements the policies of the NHPA on a state-wide level. The OHP also carries out the duties as set forth in the Public Resources Code (PRC) and maintains the California

---

[1] *Code of Federal Regulations (CFR), 36 Section 60.2.*

Historic Resources Inventory. The State Historic Preservation Officer (SHPO) is an appointed official who implements historic preservation programs within the state's jurisdictions. Also implemented at the state level, CEQA requires projects to identify any substantial adverse impacts which may affect the significance of identified historical resources. Further discussion of OHP survey methodology and specific criteria to determine the significance of a resource are also provided in Section 3, Environmental Setting, of this document.

1. California Register of Historical Resources

Created by Assembly Bill 2881, which was signed into law on September 27, 1992, the California Register is "an authoritative listing and guide to be used by state and local agencies, private groups, and citizens in identifying the existing historical resources of the state and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change."[2] The criteria for eligibility for the California Register are based upon National Register criteria.[3] Certain resources are determined by the statute to be automatically included in the California Register, including California properties formally determined eligible for, or listed in, the National Register of Historic Places.[4]

The California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed on the National Register of Historic Places and those formally Determined Eligible for the National Register of Historic Places;
- California Registered Historical Landmarks from No. 770 onward;
- Those California Points of Historical Interest that have been evaluated by the OHP and have been recommended to the State Historical Commission for inclusion on the California Register.[5]

Other resources which may be nominated to the California Register include:

- Individual historical resources;
- Historical resources contributing to historic districts;

---

2 *California Public Resources Code Section 5024.1(a).*

3 *California Public Resources Code Section 5024.1(b).*

4 *California Public Resources Code Section 5024.1(d).*

5 *California Public Resources Code Section 5024.1(d).*

- Historical resources identified as significant in historical resources surveys with significance ratings of Category 1 through 5;
- Historical resources designated or listed as local landmarks, or designated under any local ordinance, such as a historic preservation overlay zone.[6]

2. CALIFORNIA ENVIRONMENTAL QUALITY ACT

Under CEQA, a "project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment."[7] This statutory standard involves a two-part inquiry. The first involves a determination of whether the project involves a historical resource. If so, then the second part involves determining whether the project may involve a "substantial adverse change in the significance" of the historical resource. To address these issues, guidelines that implement the 1992 statutory amendments relating to historical resources were adopted in final form on October 26, 1998 with the addition of State CEQA Guideline Section 15064.5. The State CEQA Guidelines provide that for the purposes of CEQA compliance, the term "historical resources" shall include the following:[8]

- "A resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources.
- A resource included in a local register of historical resources, as defined in section 5020.1(k) of the Public Resources Code or identified as significant in a historical resource survey meeting the requirements in section 5024.1(g) of the Public Resources Code, shall be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.
- Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be a historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the California Register of Historical Resources, including the following:

---

6 *California Public Resources Code Section 5024.1(e).*
7 *California Public Resources Code Section 21084.1 – Added in 1992 by AB 2881.*
8 *State CEQA Guidelines, 14 CCR Section 15064.5(a).*

a. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

b. Is associated with the lives of persons important in our past;

c. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

d. Has yielded, or may be likely to yield, information important in prehistory or history.

- The fact that a resource is not listed in, or determined to be eligible for listing in the California Register of Historical Resources, not included in a local register of historical resources (pursuant to section 5020.1(k) of the Public Resources Code), or identified in a historical resources survey (meeting the criteria in section 5024.1(g) of the Public Resources Code) does not preclude a lead agency from determining that the resource may be a historical resource as defined in Public Resources Code sections 5020.1(j) or 5024.1."

C. LOCAL LEVEL

1. City of Costa Mesa

The City of Costa Mesa enacted its historic preservation ordinance (Article 14, Chapter IX of Title 13 in the City's Municipal Code) in October 1999. The City's preservation ordinance is the primary body of local laws relating to historic preservation. The ordinance allows the City to establish a Local Register of Historic Places, which is a list of all designated cultural resources, landmarks, and historic districts within the community. According to the ordinance, Local Register designation may include any building, structure, site, object, district, improvement, or natural feature that is over fifty (50) years old or, in special circumstances under fifty years of age, if it meets the significance criteria of the National Register or exemplifies or reflects the broad cultural, political, social, economic, or architectural history of the City; is identified with important personages or historical events; embodies distinctive architectural characteristics; or represents the work of a notable builder, designer, or architect. The preservation ordinance also recognizes and considers the significance of cultural and archaeological resources.

3. Environmental Setting

A. HISTORIC CONTEXT

1. City of Costa Mesa[9]

Early History

The first Europeans to see what would become Orange County were members of the 1542 expedition of Juan Rodriguez Cabrillo. Cabrillo sailed along the coast but did not explore inland. Europeans did not return to the Orange County area until the summer of A.D. 1769, when Don Gaspar de Portola aided by Father Junipero Serra led an overland expedition north from Mexico in search of Monterey Bay. The first permanent Euro-American settlement in Orange County was established when a spot along the El Camino Real, where it crossed San Juan Creek, was selected as the site for a Franciscan religious mission in the spring of 1775. The new San Juan Capistrano Mission did not become fully operational until November 1776 and was eventually relocated to slightly higher ground 3.5 miles southwest to its present site in 1778.

Large tracts of land fell under Mission San Juan Capistrano's authority under Spanish law. The area was once grazing grounds for cattle belonging to Mission San Juan Capistrano. Just after the turn of the 19th century, as a means to encourage effective occupation, the Spanish Crown issued large land grants. On July 1, 1810 Governor Jose Joaquin Arrillaga awarded the Rancho Santiago de Santa Ana to Jose Arrillaga Yorba and his nephew Juan Pablo Peralta. This land grant contained approximately 62,500 acres. Costa Mesa is situated on a portion of this old Spanish land grant.

Early Development of Costa Mesa

The history of Costa Mesa is the story of three communities of the past that included an old boomtown called Fairview; the Boston farming colony of Paularino (Polloreno); and the village of Harper that all once thrived within Costa Mesa's city limits.

By the 1880s, settlers had begun buying portions of the rancho land from Yorba's heirs and in the same decade established the town of Fairview. The town was centered around the present day intersection of Adams Avenue and Harbor Boulevard. Over the next few years

[9] *Adapted from "A Hundred Years of Yesterdays: A Centennial History of the People of Orange County and their Communities" by Karen Turnbull, 1988.*

development of Fairview grew at a rapid pace with a post office, school house, church, and corner drug store constructed. A narrow gauge train line, the Santa Ana, Fairview & Pacific Railroad, was brought in from the county seat, Santa Ana to provide visitors access to the nearby hot sulfur springs. Despite attempts to promote the continuing development of Fairview, by the spring of 1889 the little town began to collapse. After a storm washed out the railroad in mid-March many of the residents began to leave and the once successful business establishments were closed. Much of the area eventually reverted to farming and agriculture.

Another little town was founded on Costa Mesa land in the late 1800s by Eduardo Polloreno (Paularino), who came into possession of the land when the Rancho Santiago de Santa Ana was partitioned. The first settlers came from Boston, Massachusetts to Polloreno in the spring of 1886. This settlement contained roughly 800 acres and was bounded by today's Fairview Road on the west, Newport Boulevard on the east, the San Diego Freeway on the north, and by a line about 1.5 miles south of Baker Street. Much of the land was split up for small farms and the growing of various crops. Unfortunately, without a business center the community could not thrive and develop. The static growth of Polloreno eventually led to its demise. Only the Paularino street signs are left as a reminder of this small agricultural settlement.

Just early into the 20th century the little town of Harper, named after rancher Gregory Harper, Jr., was founded to the south after the discovery of oil promoted further settlement and development. Near the close of 1908, a large two-story structure with a general store and post office was constructed on the northeast corner of 18th Street and Newport Boulevard. Most of the population was centered between Newport Boulevard on the west, Orange Avenue on the east, 17th Street on the south, and 19th Street on the north. The Harper Methodist Episcopal Church, considered a permanent church facility, was constructed in 1915 at the southwest corner of Center Street and Newport Boulevard. Further tract development, an available water supply, the expansion of road construction and auto facilities, and the broadening of farm goods all added to the permanence of this town. The farming community of Harper was renamed in 1920 to Costa Mesa, the Spanish equivalent of "coastal tableland." This is a reference to the city's geographic location as being on a plateau by the coast.

Between 1920 and 1940, the population of Costa Mesa grew from 200 to 4,692. With the increase in population the development of commercial activity and construction also increased. Many stores, markets, garages, banks and other industries were constructed along the busy thoroughfare of Newport Boulevard. The Costa Mesa Grammar School was constructed on a five-acre plot at the northwest corner of 19th Street and Newport Boulevard in 1923. The previous year the town's Chamber of Commerce formed.

With the onset of the Great Depression a number of public schools managed to be constructed. The Monte Vista School at the corner of Center and Placentia avenues was erected in 1930 and the Lindbergh Grammar School in 1931. Unfortunately, the economics of the time caught up and the Costa Mesa branch of the Bank of Balboa was closed in 1932 and the rail line of the Southern Pacific Railroad, which ran from Santa Ana to Newport Beach along Newport Boulevard, was abandoned. The Long Beach earthquake of 1933 also damaged many buildings, businesses, and school facilities. Most of these improvements were re-built and continued operation.

World War II brought thousands of people to the area for training at the Santa Ana Army Air Base (SAAAB). When the war ended many of these men and women returned to their families and the base was eventually decommissioned; a portion of which was converted for use as a junior college that became Orange Coast College. On June 29, 1953, Costa Mesa was formally incorporated with a population of 16,840 covering an area of 3.5 square miles. Within three decades the city's population had nearly quintupled.

Residential tract building in Costa Mesa began in earnest following World War II with builders constructing contemporary ranch homes in styles popular of the time. Large-scale residential developments included the huge "Newport Vista" home project better known as "The Freedom Homes" tract that began in 1953; the Sunshine Homes development in 1955; the Halecrest Tract in 1955; the College Park Homes just south of OCC in 1956; the Cinderella Homes (Costa Mesa Estates) in 1956; among others.

New public facilities including the Police Department structure, fire station, public library, post office, and City Hall were built in the 1960s. From 1966 to 1970 other types of commercial, financial, and industrial facilities were constructed within the City. Acres of bean fields along Bristol Street and adjacent to the 405 San Diego Freeway became South Coast Plaza, one of the largest shopping centers in southern California. Construction of the financial center of South Coast Town Center, located on the east side of Bristol Street across from the South Coast Plaza, was also constructed in 1967.

Over the past forty years new construction and redevelopment of many areas within the city have occurred and continues to date. The community's history is evident in its built environment and architecture.

2. Santa Ana Army Air Base

Despite its growth over the many years, prior to World War II Costa Mesa continued to reflect a small town atmosphere. Though with the onset of the war the growth of the community was about to be accelerated. As world tensions mounted, additional military installations were planned throughout the nation. Formal ground breaking ceremonies for the United States Air Corps Replacement Training Center took place on October 23, 1941. The first aviation cadets arrived in February of 1942. A few months later the base was renamed the Santa Ana Army Air Base (SAAAB). It consisted of three schools: the Air Force Classification Center; the Air Force Pre-Flight School for pilots; and the Air Force Pre-Flight School for bombardiers and navigators. The base eventually reached the size of 1,283 acres and included the territory west from Newport Boulevard to Harbor Boulevard, south from Warehouse Road to the present Southern California College. The main gate was located on Newport Boulevard. What is now the Orange County Fairgrounds, Orange Coast College, and the City's Civic Center were all areas that comprised portions of the SAAAB. On base were a main post office and five branches, a post exchange with five branches, three movie theaters, a service club, a library, four chapels, and a 1,500-bed hospital.

From 1942 through 1945, the war and the training activities at the SAAAB dominated Costa Mesa life. After the war, SAAAB housed German prisoners of war. They were placed in barracks near the northeast corner of the facility. With an oversupply of military training facilities created during World War II the War Department had to reduce its base structure. Many of the bases throughout the country were either realigned or decommissioned. On March 31, 1946, the base officially became inactive. A skeleton crew of some 300 civilian and military personnel was retained to protect property until its final disposal. The War Assets Administration took over control of the SAAAB from the Army on June 24, 1947. They in turn began advertising the site for sale to various Federal agencies, state and municipal governments, educational institutions, and finally private purchasers.

3. Orange Coast College

In late September of 1947, the Orange Coast College District bid on land and buildings at the inactive SAAAB for its new junior college campus. During the latter part of January, 1948, title to roughly 243 acres of land on the northern section of the old base was turned over to Orange Coast College from the War Assets Administration. The deal included seventy-one buildings that contained 285,000 square feet. Four of the barracks were remodeled as living quarters for student veterans and their families. Two were remodeled and used for dormitories and two for apartments. In addition, the base theater was converted into a school auditorium, the service club into a gymnasium, a mess hall into a cafeteria, a chapel was renamed "Veteran's Memorial Chapel," and the other former barracks buildings became classrooms. The college held an open house on September 10, 1948, with classes started three days later.

At the authorization by the Orange Coast Junior College District Board of Trustees (Board), the initial master plan for the campus was created by Los Angeles architect and planner Robert E. Alexander who also designed the first few buildings on site. He was assisted by local Corona del Mar architect Richard Pleger who worked as associate architect on the project. With the partnership of Richard Neutra and Alexander contracted in 1952, the two architects worked on the planning and architecture of the new OCC campus and furthered the seven year master plan to realization. The agreed upon scope for the Neutra and Alexander work was that each would make basic conceptual idea/design contributions with Neutra taking chief responsibility for the architectural design and Alexander assuming control of planning, organization, public relations, and logistics. Neutra provided design ideas for a business education building (complex), a science building (complex), an athletic facility, and a speech arts and music center with a large theatre. All the while, the architects were assisted by associate architect Richard Pleger who was hired on to help coordinate the projects locally; act as liaison between the architects, the Board, and contractors; and provide general assistance. The OCC campus developed incrementally over a period of several years. The master plan, simple with minimal new improvements in the beginning, grew and expanded as the student population increased and the demand for more classroom space for varied curriculum was needed. Neutra and Alexander's work at the campus occurred throughout much of the 1950s. The partnership of Neutra and Alexander; however, eventually dissolved in the late 1950s and their work with the District ceased after completion of the seven year master plan.

At the same time the campus was being initially developed with new construction through much of the 1950s, Neutra and Alexander collaborated with noted landscape architect Garrett Eckbo to assist them in creating a landscape that complemented the Modernist architectural features of the campus and which would help to further unify the campus physically and visually. Eckbo introduced tall trees, including pine, palm, and eucalyptus, within the campus and along its perimeter of the campus site to act as wind screens from the persistent southwest breezes that fanned the campus. He also included softscape elements around each of the classroom buildings, within the various open patios areas, and between each of the well-designed brick "privacy" walls that lined some of the walkways. He designed an interesting cross hatch of paved walkways to physically and aesthetically connect the buildings together. Collectively, the architecture and landscaping created a rather modernistic educational facility reflective of its time and period, and which allowed for the merging of the indoor and outdoor environs. The consideration of orientation, material choice, scale and design, the immediate indoor and outdoor environs utilized in the planning and design of the OCC campus are planning techniques that have since come to be known as environmental design, a trend advocated and promoted by Neutra for years.

The second phase of campus development occurred when Richard Pleger teamed with local master architect William E. Blurock as well as with architect Rumont W. Hougan (and later with Philmer Ellerbroek) to form Pleger, Blurock, Hougan and Ellerbroeck. Under their guard the architects completed the Homes Economics complex in 1958, designed the new Modern style gymnasium and associated men's and women's locker rooms in 1961-1962, designed the stylistically Modern Forum building in 1960, and the complementary Science Hall in 1964, among other smaller projects on the school grounds.

The campus continued to expand and develop with the construction of a new library, the Norman E. Watson Library, in the late 1960s. In the 1970s the third major building phase took place when William Blurock was called upon again to design new classrooms, offices, and other educational facilities on the campus. More recent development on campus has occurred including the construction of a new art center by Steven Ehrich in 2002 and the ABC Building by LPA, Inc. in 2011.

4. Robert E. Alexander, Architect and Urban Planner

Robert Evan Alexander was a distinguished architect and urban planner whose work primarily included large-scale commercial buildings, military housing, college campuses, churches, and other public projects. Born in 1907, Alexander graduated from Cornell University with a degree in architecture in 1930, and in the following years studied at the Academie Beaux Kinds in Paris as well as in Italy and Spain. He came to California in 1932 and for the next ten years held various positions with different architectural firms until he went to work for Lockheed Aircraft in Burbank in 1942. Between 1946 and 1949 Alexander practiced as an independent architect. His innovative ideas for affordable housing produced the nationally prominent Baldwin Hills Village in southwest Los Angeles. Only a few years after operating his own design studio he went into partnership with noted architect Richard J. Neutra to form the firm Neutra and Alexander. The partnership eventually dissolved in the late 1950s due to personal differences, but not before they collaborated on a number of large-scale public projects, including the campus design of Orange Coast College in Costa Mesa. With Neutra he also designed the visitor centers, museum and cyclorama at the Gettysburg National Historic Park; the Petrified Forest visitor center in Arizona; the Los Angeles County Hall of Records; and the American Embassy in Karachi, Pakistan. Other projects included buildings at UCLA, USC, and Cal Tech. In 1959, the accomplished architect founded his own architectural practice, Robert E. Alexander & Associates, following the resolution of the Neutra and Alexander partnership. Locales of his yet other projects ranged from Juarez, Mexico to Anchorage, Alaska. He died in 1992 from cancer in Berkeley at the age of 84.

5. Richard J. Neutra, Architect

Richard Joseph Neutra was a prominent and widely influential Modern architect who practiced globally for over fifty years. Neutra was born in Vienna, Austria in 1892. He studied architectural engineering at the Institute of Technology and graduated in 1918. He attended the University of Zurich in Switzerland for his post-graduate studies until 1919. After World War I, Neutra worked in Germany briefly with architect Erich Mendelsohn before immigrating to the United States in 1923. After a brief stay in New York, he arrived in the Chicago area where he worked briefly with both Frank Lloyd Wright and Holabird & Roche. In 1925, Neutra settled in California, where he worked for the remainder of his career. He immediately joined the firm of fellow Vienna native, Rudolph Schindler. In 1949, Neutra and fellow architect Robert E. Alexander established a partnership dedicated to project planning and of public and commercial architecture. Together they were responsible for planning and designing many high-profile projects throughout California. The partnership ended in 1960 due to personal differences. Neutra then established a new firm – Neutra and Associates – with his son Dion Neutra, who continued the practice after his father's death in 1970.

Richard Neutra's architectural style was distinctly Modern, but with an emphasis on organic lines, natural materials, and integration of the outdoors. Neutra coined his philosophy of architecture "Biorealism" because of his insistence that Modern architecture be humanistic and recognized the client's needs for comfort and aesthetic pleasure. His later work evolved to project a warmer and more relaxed character compared to his earlier projects that were the embodiment of the International Style. His focus on the concept of transparency, distortion of visual indoor and outdoor spatial relationships, and the refinement of his trademark "spider leg" out riggings were well incorporated into many of his later works.

Richard Neutra's signature works include Modern residences in California, such as the Lovell House built in Los Angeles from 1927 to 1929; housing projects designed for the Federal Housing Authority from 1945; and several Case Study Houses designed and built from 1945 to 1948 in partnership with *Arts and Architectural* magazine in an effort that included other notable Modern architects such as Charles and Ray Eames and Eero Saarinen. In addition to homes, Neutra, some in partnership with Alexander, designed many distinguished public buildings, including the Channel Heights housing project in San Pedro, 1932; the Los Angeles Hall of Records, 1961-1962; the U.S. Embassy in Karachi, Pakistan, 1961; and many educational facilities such as Emerson Jr. High School in West Los Angeles, 1938; Palos Verdes High School in California, 1961; the Fine Arts Building at Cal State Northridge, 1961; the Kester-Avenue Elementary School in Los Angeles, 1951; the Richard J. Neutra Elementary School in Lemoore, 1961; and the Orange Coast College campus from the 1950s to the early 1960s.

Neutra influenced numerous young architects through his role as an educator at Harvard, Princeton, Yale, Massachusetts Institute of Technology, the Illinois Institute of Technology, and other colleges and universities. Additionally, through the course of his career Neutra published many books including *Architecture of Social Concern*, 1948; *Mystery and*

Realities of the Site, 1951; *Survival Through Design*, 1954; *Richard Neutra-Mensch Und Wohnen,* 1956; *Life & Human Habitat*, 1956; and *Realisimo Biologico*, 1958.

Richard J. Neutra is considered one of the world's most influential modern architects. His innovative and open plan designs express the freedom from conventions that many find in southern California. In 1949 he was featured on the cover of *Time* magazine and hailed for having humanized modern architecture. In 1955, the Richard Neutra archive was established at the University of California, Los Angeles. In 1977 he was posthumously awarded the AIA's highest honor, the Gold Medal.

Those buildings at the Orange Coast College campus that were designed by Neutra are indicative of his "Biorealism" architectural philosophy and stylistic conventions for modern educational facilities at the time. This collection of buildings is the oldest physical manifestation of his small portfolio work within the Orange County region. Neutra's other works in the area include the Garden Grove Community Church, 1961; the Mariners Medical Arts Building in Newport Beach, 1963; and the Huntington Beach Central Library, 1975.

6. Garrett Eckbo, Landscape Architect

Garrett Eckbo is recognized as one of the central figures in American modern landscape architecture whose career spanned five decades. Eckbo worked to change the typical formal Beaux-Arts system of landscape design as his work demonstrated innovative design ideas in a social and economic setting. He was known for thinking of the "broad landscape and society first, before focusing on the garden," a notion that was reflected in the types of work he was commissioned for during his career. His designs were centered on the garden, which he believed was the prototype for all landscape design. His work was influenced by modernist European architecture, modern art, and vernacular landscape traditions.

Born in Cooperstown, New York in 1910, he relocated with his family to Alameda, east of San Francisco, after his mother and father divorced in 1912. A graduate of the University of California at Berkeley, Eckbo went to do graduate work at the Harvard School of Design. Even before he graduated, Eckbo published the first of a long line of studies and books on landscape architecture, entitled "Small Gardens." The study focused on how creative gardens could be designed for increasingly small lots. After graduating, he went on to form numerous architecture and planning partnerships, designing gardens and working on plans for camps and recreational facilities for the New Deal's Farm Security Administration. From 1942 to 1945, he participated in the World War II effort by contributing landscape designs for defense housing in the San Francisco region. In the post-war years he founded a firm with Robert Royston and Edward Williams that focused primarily on suburban parks and planned communities. He headed south to Los Angeles in 1946 to establish an extension of the firm with Francis Dean. In the years that followed, the firm's projects included a multitude of garden designs and collaborations with Modernist architects, such as architects Robert Alexander and Richard Neutra, on several large-scale planning and development ventures. As Alexander worked on the basic site for the new modern Orange Coast College he brought Eckbo in to help integrate a landscape plan that was both functional and aesthetically pleasing.

During the 1960s, Eckbo was commissioned with the strategic open space plan for the entire state of California. Eckbo was an accomplished designer of campus landscapes. Among his best-known commissions are studies and designs for several University of California campuses, Loyola University in Los Angeles, Ambassador College, the University of New Mexico, and Orange Coast College. Several lesser-known campuses include all of the schools in the Whittier Public School District and many of school campuses in the Long Beach Public School District.

In 1964, Eckbo went on to form EDAW with Dean, Austin, and Williams. During the 1960s Eckbo, working with EDAW, designed the landscape for the Ambassador College in Pasadena. EDAW become one of the foremost private planning and landscape architecture firms in the world. They were later purchased by AECOM in 2009, but remain involved with large-scale urban projects.

7. Pleger, Blurock, Hougan, and Ellerbroeck, Architects

Richard H. Pleger (1908-2010) had worked with Robert Alexander early-on and later with both Neutra and Alexander at the OCC campus. By the mid-1950s the Board had authorized his work to design the entrances to the campus off Harbor Boulevard and later along Fairview Road. Although originally from Kansas, he studied at the University of Southern California from 1926 to 1929 earning an architectural degree. Professionally, little is known about Pleger as the 1956 *American Architects Directory* lists only his name and business address. Both the 1962 and 1970 *American Architects Directory* lists his previous firm as Pleger, Blurock, Hougan, and Ellerbroeck and at that time he was practicing architecture under his name part-time (as he was listed as semi-retired in Corona del Mar).

William H. Blurock, FAIA (1922-2012) was a Newport Beach architect whose work from the 1950s through the 1970s was considered visionary in the burgeoning field of modern educational design. Over his long career, Blurock guided the planning and design of buildings on 32 California college campuses, and scores of other educational facilities throughout the state, including Orange Coast College and the University of California, Irvine. A Los Angeles native, Blurock was a 1947 graduate of the University of Southern California, School of Architecture. In 1993, he was honored as the Distinguished Alumnus of the architecture school and was elected an AIA Fellow in 1968 for outstanding contributions to the design and science of construction. By 1970, Blurock's architectural practice was listed as William Blurock & Parnters, a successor to William H. Blurock & Associates. He served on the local AIA Orange County chapter as president and as an AIA national director in the late 1970s. He was appointed by Governor Ronald Reagan to the California State Board of Architectural Examiners for which he served 13 years.

Architect Rumont W. Hougan (1912-2005) was an architect who had worked as a draftsman for noted architect Myron Hunt and H.L. Chambers in the late 1930s and later for master architect Gordon B. Kaufman. Born in Rock Valley, Iowa he studied architecture at the University of Nebraska from 1931 to 1933. He joined Richard Pleger's office in Corona del Mar in 1947, partnered in 1952, and later became part of the Pleger, Blurock, Hougan and Ellerbroek design team. The *American Architects Directory* (1956, 1962, 1970) lists Hougan as a practicing architect in Corona del Mar without any projects credited to his name. He had his own architectural practice from 1960 to 1970 and joined the firm of Rolly Pulaski, a Newport Beach architect, in 1970. He was also a member of the local AIA Orange County chapter and a member of their historic preservation committee.

Philmer J. Ellerbroek (1905-1969) from Sioux City, Iowa also studied at the University of Southern California graduating in 1928. He was a member of the AIA Orange County chapter having served as president in 1954 and was later elected as an AIA Fellow in 1967. He established his own practice in 1946 and later became a partner in Pleger, Blurock, Hougan and Ellerbroek in the late 1950s. He served on the Newport Beach Planning Commission from 1940 to 1950. In reviewing the *American Architects Directory* (1956, 1962) besides his work with the firm herein at the OCC campus, other representative examples of his work include the design of a department store in Corona (1952), a number of elementary schools in Newport Beach (1955), and an office building in Newport Beach (1955). He went on to join William H. Blurock in the 1960s to establish Blurock Ellerbroeck & Associates and later established his own private practice.

B. EXISTING CONDITIONS

The OCC campus occupies an approximately 160-acre site in the City of Costa Mesa in central Orange County. The project site is surrounded by the cities of Santa Ana to the north, Fountain Valley and Huntington Beach to the west, Newport Beach to the south, and Irvine to the east. OCC, like most of Costa Mesa, is located on flat terrain. The Santa Ana River passes 1.5 miles west of the campus and drains into the Pacific Ocean located 4 miles southwest of the campus. The campus is within the vicinity of John Wayne International Airport located 2 miles east from OCC.

The campus is situated in an urbanized setting. North of the campus, across Adams Avenue, are high-density residential developments (multi-family residences), and low-density residential developments (single-family dwellings) are south of Merrimac Way. Costa Mesa High School and the Orange County Fair and Event Center (OC Fairgrounds) are located to the east across Fairview Road, and commercial and residential development is located to the west of the campus along Harbor Boulevard. The District headquarters is situated along the north side of Adams Avenue just west of the Adams Avenue campus entry into the OCC campus. OCC is accessible from the surrounding areas by three primary access points: Pirate Way, Monitor Way, and S Street.

The OCC campus is one of three colleges of the District. Occupying land that was once part of the Santa Ana Army Air Base developed during World War II, OCC still remains under government ownership and is designated as Public/Institutional Land. Currently, the OCC campus contains more than 80 buildings and multiple recreational fields that occupy 647,603 assignable square feet (ASF) of space. In addition, there is 4,348 square feet of inactive space.

The northwest corner of the site currently contains undeveloped land, some of which is used for parking. Classrooms and academic buildings are predominately in the center to the south end of the campus. Athletic buildings and fields make up the majority of the northeast corner of the campus grounds. Parking lots are located all throughout the campus, but are mainly found along the perimeter. The OC Fairgrounds parking lot across Fairview Road to the east serves as additional off-site parking for students. An additional feature to this campus is a recycling center on the north side of the campus, which provides additional revenue to OCC.

C. CRITERIA FOR EVALUATION OF HISTORIC RESOURCES

In assessing the historic significance of properties located within the study area, various criteria for designation under federal, state, and local landmark programs were considered and applied. The California Office of Historic Preservation survey methodology and instructions were used to evaluate the relative significance of properties.

1. National Register of Historic Places Criteria

To be eligible for listing in the National Register, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance must also possess integrity of location, design, setting, materials, workmanship, feeling, and association. For National Register consideration four criteria have been established to determine the historical significance of a resource: [10]

Criteria

A property of potential significance must meet one or more of the following four established criteria:

A. It is associated with events that have made a significant contribution to the broad patterns of our history;

B. It is associated with the lives of persons significant in our past;

C. It embodies the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction;

D. It yields, or may be likely to yield, information important in prehistory or history.

A property eligible for the National Register must meet one or more of the above criteria. In addition, unless the property possesses exceptional significance, it must be at least fifty years old to be eligible for National Register listing.

Integrity

In addition to meeting the criteria of significance, a property must have integrity. "Integrity is the ability of a property to convey its significance."[11] According to *National Register Bulletin 15*, the National Register recognizes seven aspects or qualities that, in various combinations, define integrity. To retain historic integrity a property will always possess several, and usually most, of these seven aspects. Thus, the retention of the specific aspects of integrity is paramount for a property to convey its significance.[12] The seven factors that define integrity are location, design, setting, materials, workmanship, feeling and association. The following is excerpted from *National Register Bulletin 15,* which provides guidance on the interpretation and application of these factors:

---

[10] *Guidelines for Completing National Register Forms, National Register Bulletin 16, U.S. Department of Interior, National Park Service, September 30, 1986 ("National Register Bulletin 16"). This bulletin contains technical information on comprehensive planning, survey of cultural resources and registration in the National Register of Historic Places.*

[11] *National Register Bulletin 15, p. 44.*

[12] *Ibid.*

- Location is the place where the historic property was constructed or the place where the historic event occurred.[13]
- Design is the combination of elements that create the form, plan, space, structure, and style of a property.[14]
- Setting is the physical environment of a historic property.[15]
- Materials are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.[16]
- Workmanship is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.[17]
- Feeling is a property's expression of the aesthetic or historic sense of a particular period of time.[18]
- Association is the direct link between an important historic event or person and a historic property.[19]

[13] *"The relationship between the property and its location is often important to understanding why the property was created or why something happened. The actual location of a historic property, complemented by its setting is particularly important in recapturing the sense of historic events and persons. Except in rare cases, the relationship between a property and its historic associations is destroyed if the property is moved." Ibid.*

[14] *"A property's design reflects historic functions and technologies as well as aesthetics. It includes such considerations as the structural system; massing; arrangement of spaces; pattern of fenestration; textures and colors of surface materials; type, amount, and style of ornamental detailing; and arrangement and type of plantings in a designed landscape." Ibid.*

[15] *Ibid, p.45.*

[16] *"The choice and combination of materials reveals the preferences of those who created the property and indicated the availability of particular types of materials and technologies. Indigenous materials are often the focus of regional building traditions and thereby help define an area's sense of time and place." Ibid.*

[17] *"Workmanship can apply to the property as a whole or to its individual components. It can be expressed in vernacular methods of construction and plain finishes or in highly sophisticated configurations and ornamental detailing. It can be based on common traditions or innovative period techniques." Ibid.*

[18] *"It results from the presence of physical features that, taken together, convey the property's historic character." Ibid.*

[19] *"A property retains association if it is the place where the event or activity occurred and is sufficiently intact to convey that relationship to an observer. Like feeling, association requires the presence of physical features that convey a property's historic character. . . Because feeling and association depend on individual perceptions, their retention alone is never sufficient to support eligibility of a property for the National Register." Ibid.*

In assessing a property's integrity, the National Register criteria recognize that properties change over time, therefore, it is not necessary for a property to retain all its historic physical features or characteristics. The property must retain, however, the essential physical features that enable it to convey its historic identity.[20]

For properties which are considered significant under National Register Criteria A and B, *National Register Bulletin 15* states that a property that is significant for its historic association is eligible if it retains the essential physical features that made up its character or appearance during the period of its association with the important event, historical pattern, or person(s).[21]

In assessing the integrity of properties which are considered significant under National Register Criterion C, *National Register Bulletin 15* provides that a property important for illustrating a particular architectural style or construction technique must retain most of the physical features that constitute that style or technique.[22]

CONTEXT

To be eligible for listing in the National Register, a property must also be significant within a historic context. *National Register Bulletin 15* states that the significance of a historic property can be judged only when it is evaluated within its historic context.[23] Historic contexts are "those patterns, themes, or trends in history by which a specific…property or site is understood and its meaning…is made clear." A property must represent an important aspect of the area's history or prehistory and possess the requisite integrity for the National Register.

CULTURAL LANDSCAPES

The National Park Service recognizes landscape features as a type of resource that can contribute to the significance of a historic district. To further understand and assess the contribution of significant landscape features the concept of a *cultural landscape* is useful as a framework for evaluation.

National Register Bulletin 30: How to Evaluate and Document Rural Historic Landscapes (NPS 1989) and *Preservation Brief 36: Protecting, Treatment and Management of Historic*

[20] *Ibid, 15, p. 46.*

[21] *Ibid.*

[22] *"A property that has lost some historic materials or details can be eligible if it retains the majority of the features that illustrate its style in terms of the massing, spatial relationships, proportion, pattern of windows and doors, texture of materials, and ornamentation. The property is not eligible, however, if it retains some basic features conveying massing but has lost the majority of the features that once characterized its style." Ibid.*

[23] *Ibid. p.7.*

Landscapes (NPS 1994) provide the guidance for considering and evaluating cultural landscapes within the National Register criteria, and the terminology described in these technical references is generally used at the federal, state, and local levels to document, describe, and analyze cultural landscapes.

Important cultural landscapes may be composed of a number of character-defining features which individually or collectively contribute to the landscape's physical appearance as they have evolved over time and within the property's period of significance. These landscapes may include a grouping of features such as topography, vegetation, water elements (pools, fountains, ponds, streams, etc.), circulation elements (roads, paths, steps, walls, etc.), buildings and furnishings (fences, benches, light fixtures, gates, sculptural objects).

NPS also states that each situation may vary, and some features may often be more important than others. According to the NPS guidelines, "it is the arrangement and the interrelationship of these character-defining features as they existed during the period of significance that is most critical…" As such, spatial organization and land patterns are of primary concern when defining and evaluating a cultural landscape.

2. California Register of Historical Resources Criteria

To be eligible for the California Register, a historic resource must be significant at the local, state, or national level under one or more of the following four criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

2. Is associated with the lives of persons important in our past;

3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; and/or

4. Has yielded, or may be likely to yield, information important in prehistory or history.

Additionally, a historic resource eligible for listing in the California Register must meet one or more of the criteria of significance described above and retain enough of its historic character or appearance (integrity) to be recognizable as a historic resource and to convey the reasons for its significance. Historical resources that have been rehabilitated or restored may be considered and evaluated for California Register listing.[24]

Integrity, as considered for the California Register, is evaluated with regard to the retention of location, design, setting, materials, workmanship, feeling, and association. The resource must also be judged with reference to the particular criteria under which it is proposed for eligibility. It is possible that a historic resource may not retain sufficient integrity to meet the criteria for listing in the National Register, but it may still be eligible for listing in the California Register.[25]

3. California Office of Historic Preservation Survey Methodology

The evaluation instructions and classification system prescribed by the OHP in its *Instructions for Recording Historical Resources* provide a three digit evaluation code for use in classifying potential historic resources. The first digit indicates one of the following general evaluation categories.

1. Listed in the National Register or the California Register;
2. Determined eligible for listing in the National Register or the California Register;
3. Appears eligible for the National Register or the California Register through survey evaluation;
4. Appears eligible for the National Register or the California Register through other evaluation;
5. Recognized as Historically Significant by Local Government;
6. Not eligible for any Listing or Designation; and
7. Not evaluated for the National Register or California Register or needs re-evaluation.

The second digit is a letter code to indicate whether the resource is separately eligible (S), eligible as part of a district (D), or both (B). The third digit is a number, which is used to further specify significance and refine the relationship of the property to the National Register and California Register. Under this system categories 1 through 4 pertain to various levels of National Register or California Register eligibility. Category 5 pertains to properties that are

---

[24] *California Code of Regulations, California Register of Historical Resources (Title 14, Chapter 11.5), Section 4852(c).*

[25] *Ibid.*

ineligible for National Register or California Register listing, but are recognized as historically significant by local government. In addition, properties not eligible for listing or designation in the National Register, California Register, or at the local level, but perhaps are of local interest in the planning process are given an evaluation status code of 6.

4. City of Costa Mesa Criteria

The Costa Mesa Historic Preservation Ordinance establishes criteria for designating local historic resources and/or historic districts and listing them on the City's Local Register. These properties must be over fifty years of age, unless they possess exceptional significance, and meet the significance criteria for listing in the National Register or one of the following designation criteria:

- Exemplifies or reflects special elements of the city's cultural, social, economic, political, aesthetic, engineering, architectural, or natural history; or
- Is identified with persons or events significant in local, state, or national history; or
- Embodies distinctive characteristics of a style, type, period, or method of construction; or
- Is a valuable example of the use of indigenous materials or craftsmanship; or
- Represents the work of a notable builder, designer, or architect; or
- Contributes to the significance of an historic area, being a geographically definable area possessing a concentration of historic or scenic properties or thematically related grouping of properties which contribute to each other and are unified aesthetically by plan or physical development; or
- Has a unique location or singular physical characteristics or is a view or vista representing an established and familiar visual feature or a neighborhood, community or of the city; or
- Embodies elements of architectural design, detail, materials, or craftsmanship that represent a significant structural or architectural achievement or innovation; or
- Is similar to other distinctive properties, sites, areas, or objects based on historic, cultural, or architectural motif; or

- Is a type of building or is associated with a business or use which was once common but is now rare; or

- Yields or may yield, information important in prehistory or history, and retains the integrity of those characteristics necessary to convey its significance.

5. Evaluation of Resources Less Than Fifty Years Old

A property is usually considered for its historic significance after it reaches the age of fifty (50) years. This threshold is not concrete, but was chosen as a reasonable span of time to develop historical perspective and evaluate significance adequately. Both the California Register and the City of Costa Mesa historic preservation ordinance reflect the lead of the National Register when assessing properties less than fifty years old for historical significance and utilize the fifty-year threshold.

The National Register guidelines indicate that any building less than fifty years of age must be considered under Criteria Consideration G, which states that "a property achieving significance within the last fifty years is eligible if it is of exceptional importance.[26] Properties that are less than fifty years old must meet Criteria Consideration G, as must "a property that continues to achieve significance into a period less than fifty years before the nomination."[27]

D. SURVEY STUDY AREA DEFINED

The study area was identified based on the anticipated direct and indirect effects of the proposed project on potential historic resources. The study area was defined as the project site itself, which is the OCC campus (2701 Fairview Road). A map of the survey study area and existing conditions of the campus is illustrated in Figure 3-1, Survey Study Area/Existing Conditions.

E. EVALUATION OF HISTORIC RESOURCES WITHIN STUDY AREA

A review of relevant historical records, including the California Historic Resources Inventory (HRI) and files at the City of Costa Mesa indicates that the OCC campus was previously documented and evaluated for historical significance as part of the City's city-wide historic resources survey conducted in 1999. At that time, the central core campus comprised of a grouping of linear configured, small-scale buildings that date from the 1950s that were built during the first phase of planning the school, many of which were planned and designed by Richard Neutra and Robert Alexander along with the associated landscaping elements of the

---

[26] *How to Apply the National Register Criteria for Evaluation, National Register Bulletin, p.41.*
[27] *Ibid.*

core campus that were designed by landscape architect Garrett Eckbo, were found to be historically significant and eligible for local landmark designation as a potential historic district.[28] This significance for this prior evaluation was based on significance of architectural style and association with master architects Richard Neutra and Robert E. Alexander.

For the purposes of this current assessment, the subject property has been re-assessed for historical significance in order to identify any potential historic resources on the campus, as defined by the CEQA Guidelines.[29]

1. Orange Coast Community College, 2701 Fairview Road

Campus Construction

The Orange Coast College campus was built on the site of the former Santa Ana Army Air Base and was founded in 1947. At the end of 1948, the Orange Coast Junior College District Board of Trustees appointed noted architect and planner Robert E. Alexander of Los Angeles and local architect Richard Pleger to prepare a multi-year master plan for the new campus. The former service buildings though being used as classrooms and dormitories after the school opened in 1948 were found not to conform to state requirements for a community college educational facility and needed to be replaced. The contract with the Board was directly with Alexander while Pleger was assigned as associate architect to assist in obtaining information locally for Alexander and to act as the on-site project manager in providing general assistance. The school master plan was to cover a seven year period with voters approving a special tax levy in May 1949.

With Robert E. Alexander enlisted to draft the new campus plan, and beginning with the Trades and Industry Building (Technology) in 1949 (now demolished), the campus building boom began to take root in the center of the college site. Alexander's initial plan retained some of the existing military structures and remodeled them for use as a gymnasium, administration offices, student center, and home economics, but also included new classroom structures for agricultural, arts and crafts, business education, and science studies. In addition, the modest master plan called for a library, theatre for the speech arts, baseball field, football field, tennis courts, and parking lots.

The new college improvements were set at a distinct 45 degree angle from the north-south orientation of the old base configuration and that of the city grid. Their placement was

---

[28] *Note that the city-wide survey only evaluated properties for local significance under the City's designation criteria.*

[29] *State CEQA Guidelines, 14 CCR Section 15064.5(a).*

designed to take advantage of the prevailing southwest breezes that helped to cool the interior spaces of the buildings. Much of the landscape was like-wise set at an angle to complement the orientation of the classrooms. Alexander's plan for the OCC campus and the contemporary architectural style of the initial buildings constructed on the site brought the campus into the age of modern campus planning.

The core group of buildings set within the center of campus played an integral role in the early development of the college. Their design conveyed their part in the development of a modern community college, an educational system that came to fruition following World War II, and which reflected the Modern era and growth of the City and County. The goals of Alexander's plan included the determination of the desirable physical size of the campus based on economics and location, the development of a vision for the relationship between existing and future buildings, and the determination of a proper area of college influence within the context of the surrounding community.

The first permanent structure to be built on the OCC campus was the Technology Building. Ground was broken at the end of 1949 and the building was completed eleven months later with the dedication taking place on November 15, 1950. Designed by Robert Alexander with the assistance of Richard Pleger, the Tech Building was a one-story structure that consisted of three saw tooth roof shop wings extending off a long linear flat roof classroom wing. Constructed at a cost of approximately $393,983, the structure stood for over 44 years until it was demolished in the 1990s after the Technology Center opened on OCC's western perimeter. The Doyle Arts Pavilion and new Library occupy the site where the original Technology Building once stood.

Design of the library, the second building on the new campus, was authorized by the Board in November 1949. Alexander along with the school's faculty, students, and associate architect Pleger crafted plans for the library in the following months. In January of 1950, the Board, on Alexander's recommendation, authorized the hiring of landscape architect Garrett Eckbo to design a landscape plan for the entire campus and for the areas adjoining the new buildings. It was also at this time that Alexander proposed to the Board the incorporation of a visually prominent clock tower as an addition to the library, which they also approved.

South Coast Construction Company was the contractor who built the second library on campus in the fall of 1950. Oversight of the project on behalf of the design architect Robert E. Alexander was Richard Pleger. The very first library was located in a converted SAAAB barracks building and operated from 1948 to 1951. The bid for the new 11,000 square foot reference repository was roughly $117,346. The one-story Modern style facility opened in the fall of 1951 and served as the Library until 1968. When the Library was relocated to Watson Hall (originally called the Norman E. Watson Library) the existing structure became the Counseling and

Admissions Building. Located in the quad, the former library is identified by the distinctive tall framed clock tower. Additions were made to this building in the form of what are now classrooms and laboratories (Buildings 8 and 9) by Neutra and Alexander a few years after its completion.

Eckbo initially developed a landscape plan that complemented the master plan of the campus. To act as windbreaks, Eckbo established tree patterns using eucalyptus, palm, and pine trees set throughout and around the campus. He also proposed landscaping around the Technology Building and Library.

The next new building proposed for the campus was the Fine Arts and Crafts Building in 1951. The structure designed by Alexander with Pleger was to contain roughly 14,000 square feet of space with room for an art studio, painting studio, art gallery, photo lab, and ceramics lab. Construction began in October 1951 with the building completed in January 1952. It was demolished 48 years later to make room for the new Arts Center that opened in 2002.

The building program for the early 1940s and late 1950s not only included the construction of the new Technology Building, Arts Center Building, and Library, but also the remodeling of the existing gymnasium, administration building, home economics classroom and some ancillary structures for use by staff and students. Because of design and construction faults with the Technology Building and Library, in early 1952 the Board considered replacement of Alexander with another architect. However, Alexander had just formed a business partnership with renowned architect Richard J. Neutra and asked the Board to reconsider his contract under the circumstances. Alexander stressed to the board that Neutra would take the design lead on all future building plans associated with the master plan. Richard Pleger would also remain on Alexander's contract as associate architect. The Board, requesting that Neutra take the lead role in the development of project plans, authorized an extended contract with Alexander and Neutra.

The first building stemming from this new design partnership of Neutra and Alexander was the Business Education Building. This classroom facility is a complex comprised of three long, linear horizontal buildings (Buildings 12, 13, and 14) that were completed in 1953 under the guidance of associate architect Richard Pleger. These Modern style one-story buildings are sheathed in red brick and stucco and feature flat roofs; covered open walkways; ribbons of fixed and louvered fenestration; short brick "privacy" walls set at angle along the walkways for privacy, air circulation, and sun control; wooden louvered overhangs; and an outdoor seating area. These buildings originally contained classrooms and laboratories for secretarial, accounting, and office training services programs. In mid-1952, the Board authorized Eckbo to draft landscape plans for the building complex.

In September 1952, Neutra and Alexander were authorized to prepare plans for a new swimming pool stadium and Speech Arts Building. Two pools (a large, deeper pool for competition, water polo, and a smaller pool for practice and beginners), deck, diving board, and bleachers were designed for the area north of the existing, remodeled gymnasium just west of Fairview Road in the northeast corner of the campus. The pool facility was completed a year later only to have problems with the surfacing of the pool walls. This problem was ultimately resolved, however, and operation of the pool by staff and students began later that year.

Neutra and Alexander with associate architect Richard Pleger also worked on the design of the Student Center, which opened in April 1953. This structure replaced the former Army PX building that had served as the Student Center for five years. The PX building had been located where the Business Education Building is located today. The Student Center from 1953 is still used today; however, it has been extensively remodeled and expanded several times. The building underwent a massive overhaul in 1992-1993.

On March 30, 1955, the $650,000 Speech Arts Building (now the Robert B. Moore Theatre) officially opened to the public. The auditorium that the college used prior to the new Speech Arts Building was a converted SAAAB movie theater that was located at the corner of Fairview Road and Monitor Way. That structure was removed in 1960. Planned by Alexander and designed by Richard Neutra the Speech Arts Building, constructed in 1954, includes the grand “aula” or auditorium, which occupies a prominent location at the hub of the campus, as well as ancillary stage production areas, choral and instrument practice classrooms, and dressing areas. In plan the minimalist auditorium is a semi-rounded and clipped ellipse, its footprint was shaped specifically to allow “theatre-in-the-round” productions and “audience-in-the-round” techniques. The theatre also accommodates a detached ticket booth office that is connected to the auditorium by covered walkways. The acoustic design and sound insulation of the theatre were supervised by noted acoustic engineer, Dr. Vern D. Knudsen, a professor at UCLA, who acted as sound consultant on the design of the theatre.

As the master plan came to fruition over the years, the landscape plan for the campus evolved in development to fully complement and integrate the new buildings. The central quad pattern of paving, grass, water, shrubs, and trees were planted adjacent to the buildings and within the brick screen walls of each classroom wing for privacy, intimacy, and warmth. Their spatial relationships purposely interconnected with the built environment.

Part of the building program for the OCC campus in the mid-1950s was the construction of a new, larger more modern football stadium with a field house and bleacher seating. According to the Board minutes, the preliminary plans drafted by Neutra and Alexander did not include space for the yell and song leaders or slight lines of the spectators. Final plans were approved in June 1954 by the Board that included as a cost-saving measure the omission of interior build-out space for concession booths and visiting team room in the field house, omission of 1,000 stadium seats, and the exclusion of an outside concession booth and toilets at the west end of the stadium. Landscaping of the stadium grounds was designed by Garrett Eckbo. The football stadium was initially opened on campus for the 1955 football season, and was dubbed Pirate Stadium. The football stadium and associated facilities like the field house, embankment bleachers, and announcer box reflect elements of the Modern idiom in their design, scale, and materials. It was built to accommodate 7,600 fans. Dirt was excavated from the site of the field and piled high on the sidelines to form the underpinnings for the grandstands. The first graduation ceremonies took place on the field in June 1956. The stadium was renamed the Harry R. LeBard Stadium in 1967. The facility was remodeled and substantially upgraded (seats, lighting, ADA access, etc.) in 2004. Despite the upgrade to the stadium its basic design, form, configuration, and components are still visually and physically evident from when it was initially constructed in 1955. The exterior of the field house has undergone only minor alterations since it was erected.

By late 1954, there was continued questioning by the Board regarding Neutra and Alexander's capability and prolific absence at Board meetings and on campus during construction of improvements. The design and construction of the Science Building was one of the last larger projects remaining in the initial multi-year master plan. Though consideration of a new architect was discussed at their October 11, 1954 board meeting no action was taken to hire a designer to oversee the project. A month later, the Board requested direct personal service from both Neutra and Alexander in exchange for renewing their contract for the design of the Science Building. They also requested Richard Pleger be hired-on by Neutra and Alexander as associate architect.

The Science Building was completed in 1956 and dedicated on April 2, 1957. Similar in configuration and design to the Business Education Building complex, the Science Building is a linear grouping of two buildings with an offset structure that houses a small planetarium. These Modern style buildings are clad in red brick and stucco and feature flat roofs; covered open walkways; ribbons of fixed and louvered fenestration; short brick "privacy" wind break walls set at angle along the walkways for intimacy, air circulation, and sun control; and wooden louvered overhangs. The circular shape planetarium building is a distinctive separate feature as it is sheathed in similar vertical board siding as the theatre auditorium (Robert B. Moore Theatre), has a round floor plan and is capped by a dome shaped standing seam patina copper roof. This structure originally included a small shallow pool at its western base that followed the shape of the curved exterior wall; however, this feature has since been removed and paved. As a complementary art piece to the study of science an armillary sphere designed by noted Laguna Beach artist Peterpaul Ott was installed at the south end of the building complex. This piece cost roughly $5,000 and weighs 1,000 pounds with a concrete foundation sunk six feet underground. Of course, landscaping around the Science Building was planned and designed by Eckbo upon approval by the Board. The landscape plan called for 140 trees, 500 shrubs, and 900 small ground plants keeping the existing trees.

After almost ten years of service, Neutra and Alexander's contract was not renewed by the Board. Rather the Board considered a new set of architects to finish the initial master plan programming and author in a second phase of development and expansion for the campus. It was also at this time that the partnership of Neutra and Alexander began to strain and was ultimately dissolved in 1958. They both went on to manage their own architectural practices.

In November 1956, the Board authorized the architectural firm of Pleger, Blurock and Hougan (later changed to Pleger, Blurock, Hougan, and Ellerbroek) to prepare plans and specifications for the design of a Home Economics Building. The design of the new complex was to be as specified in Alexander's master plan and as designed by Neutra, which called for two parts a general classroom wing and a main wing for home economics facilities. The two-part Home Economics Building was constructed by A.D. Penhall, general contractor, and completed in June 1958. The building originally was designed with a craft and supplementary clothes laboratory, a complete clothing laboratory, a laundry area and a foods laboratory. Also included were a living room classroom, six separate classrooms, and a clothing workroom and food workroom. The grounds about the complex were designed by landscape architect Frederick M. Lang. On campus today, these facilities are now referred to and used as the Journalism Building and Writers Row.

A large lecture hall, referred to as the Forum, was authorized by the Board in 1958 with plans drafted by Pleger, Blurock, Hougan, and Ellerbroek. The semi-circular shape building and curving covered walks included roughly 8,995 square feet of space to accommodate a 400 seat lecture hall with closed circuit television, instructors' offices, work rooms, and restrooms. The Modernistic building was designed after the style, form, materials, and features of the Speech Arts auditorium (Robert B. Moore Theatre). The Forum was completed in 1960 and has been utilized for classroom lectures and evening programs. Landscaping plans for the grounds of the new lecture hall were completed by Frederick M. Lang. The Forum was rechristened the Dr. Giles T. Brown Forum in the spring of 2007.

The two-story OCC gymnasium was completed in December 1961 and christened the Peterson Gymnasium after the founding president Basil H. Peterson in 1962. Designed by Pleger, Blurock, Hougan and Ellerbroek to complement the Modernistic style of the improvements throughout the campus, this complex includes a large indoor gymnasium with formal lobby, classrooms, toilets, storage, weight room, dance room, and wrestling area. It also includes a separate men's locker room wing, a separate women's locker room wing, and covered walk and brick wall that interconnects the locker rooms, pool stadium, and gymnasium together. The minimalist larger gymnasium features a multi-plane flat roof, minimal ornamentation, ribbons of clerestory windows, cantilevered canopies over pedestrian walkways, and a large glazed entry court that fronts south onto the parking lot. The one-story men's and women's locker rooms as well as the pool stadium are situated to the east of the gymnasium and are separated by a covered walkway. The locker rooms are similar in design features and basic form as the gymnasium, though on a smaller scale.

Plans for a science lecture hall addition was initially reviewed and approved by the Board in June 1959. After several iterations of preliminary plans and oversight of construction problems the building was finally completed in 1964. The architects Pleger, Blurock, Hougan, and Ellerbroek designed the large lecture hall after the shape and style of the Moore Theatre (Speech Arts Building auditorium) and the later Forum building. With 374 seats the Science Hall was built on campus at a 70-degree angle as opposed to the Forum's 90-degree angle. This arrangement of the two lecture halls added further uniqueness to the campus and complemented the Modernistic trends of the Forum and the Robert B. Moore Theatre. The adjacent Science Lecture Hall classrooms opened in the fall of 1971.

Expansion and improvement of the campus through much of the 1960s was slow with little new construction occurring. A third master plan phase was developed in the 1970s when many new buildings were designed in the Post-Modern style and erected on the perimeter of the central campus quad. Additional building programs followed in the 1990s and 2000s.

SIGNIFICANCE EVALUATION

The OCC campus today comprises a wide variety of buildings and landscape elements representing evolving ideas in community college planning and architecture. As indicated above, the first major phase of development occurred with the initial planning of the campus and drafting of the master plan by Robert E. Alexander. Representative of prevailing campus planning trends at the time the stylistic design of the early buildings set the precedence for future building.

The basic design of the campus and classrooms were consistent with the building traditions of the time as well. Unlike the design of most earlier classroom buildings, postwar campuses exploited steel framing, plate glass, and low-rise horizontal massing. The standardized plans of multi-story, pre-war school structures were rejected by modernist architects of the day. The desire for flexibility, a key term of postwar building, enhanced the popularity of new materials and configurations of plan design for both lower and higher educational facilities. Flexibility was both a desirable quality for the structural aspects of a building, embodied in open corridors, non-load-bearing partitions, and zoned ventilation and heating systems, but also included provisions for re-arranging interior features and spaces.

As mentioned, the Orange Coast College campus was planned in incremental stages over a period of years. The central core of the campus physically and visually reflects the unity and cohesiveness that Alexander planned for and Neutra envisioned by design. This early master planning of the campus was further integrated and complemented by the landscape program designed and executed by landscape architect Garrett Eckbo. The interrelationship between the buildings and landscape is still physically and visually evident by the arrangement and configuration of the buildings to the walkways, plantings, signage, and other associated accessory features.

Collectively, the buildings' combination of relaxed informality and restrained compositional style along with the distinctive landscape features defines the core campus as a Neutra and Alexander inspired design. The detached, one-story linear classroom wings of brick, stucco, wood, and glass, and a more explicit interaction with the outdoor plantings and hardscape features help to achieve this more informal effect. The long sleek band of ribbon windows, stucco sheathing with brick treatment, spider leg outriggings, louvered wall screens and louvered shade canopies, and immaculate detailing help to connect the buildings and their design with Richard Neutra's earlier work elsewhere.

The later work of the 1950s by Pleger, Blurock, Hougan and Ellerbroek, also complements Alexander's initial improvements on the campus as well as Neutra and Alexander's collective designs for the college. Those subsequent design efforts that were directed by the Board also included the work of noted Orange County architect William Blurock.

Because the central core of the campus possesses a significant concentration, linkage, and continuity of buildings, structures, landscape features, and objects that are united historically, architecturally, and aesthetically by plan and physical development this area is identified as a potential historic district. The district derives its importance from being a unified entity that visually conveys a sense of the overall historic environment and shares an interrelationship by arrangement, function, and plan. This collection of improvements, including its buildings, structures, landscape, and accessory objects is also historically significant as they embody the distinctive characteristics of a particular property type, period of construction, and architectural expression. This district is also the collective work involving master planner and architect, Robert E. Alexander; master architect, Richard J. Neutra; master landscape architect Garrett Eckbo, and local master architect William E. Blurock. The period of significance for the historic district is 1948 to 1964. This span of time captures the initial master planning and design of the community college by Robert E. Alexander; the design and planning work of Neutra and Alexander; as well as the early phase two master plan work of William E. Blerock under the partnership of Pleger, Blurock, Hougan and Ellerbroek.

Contributors to the district represent the significant property types that comprise a historic community college educational institution. [30] These include the classroom facilities; laboratory facilities; student/faculty support facilities; lecture auditoriums and theater; physical education facilities; and lecture halls. Landscape features of the district include paved walkways and their material, location, configuration, and design; mature plantings set around classroom buildings and within screen walls, patio areas, and open sitting areas; flagpole, clock tower, distinct planter boxes, signage, and other similar objects within the core campus grounds; and many of the mature plantings and tall trees set within the campus grounds.

The historic district has been evaluated as eligible for listing in the California Register under Criterion 1 for its early master planning concepts of a community college located within Orange County and under Criterion 3, for its distinctive architectural and design qualities as interpreted in an educational facility and for its direct association with master planner and architect Robert E. Alexander; master architect Richard Neutra; landscape architect Garrett Eckbo; and Orange County architect William E. Blurock. The property also satisfies the local City of Costa Mesa criteria for architecture and educational development. As such, the subject property as defined above is considered a historic resource pursuant to the CEQA Guidelines[31]

The Robert B. Moore Theatre building is also individually historically significant for its unique and distinctive architectural styling and direct association with master designers: architect Richard Neutra; landscape architect Garrett Eckbo; and acoustical engineer Dr. Vern Knudsen. Therefore, this property is also considered a historic resource pursuant to the CEQA Guidelines on its own merit.

---

[30] *A contributing property is defined as any building, structure, or object located within a historic district that adds to the historical integrity or architectural qualities that make the district significant. Contributors to historic districts are considered historic resources under CEQA.*

4. ANALYSIS OF PROJECT IMPACTS

A. THRESHOLDS OF SIGNIFICANCE/CRITERIA FOR ADVERSE IMPACTS

1. CEQA GUIDELINES

The CEQA Guidelines state that a project involves a "substantial adverse change" when one or more of the following occurs:

- Substantial adverse change in the significance of a historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired.[32]

- The significance of a historical resource is materially impaired when a project:[33]

  a. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources; or

  b. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in a historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

  c. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA.

As such, substantial adverse effects may include, but are not limited to, physical destruction or damage to all or part of a historic property caused by vibration and/or sound;

---

[32] *State CEQA Guidelines, 14 CCR Section 15064.5(b)(1).*

[33] *State CEQA Guidelines, 14 CCR Section 15064.5(b)(2).*

removal of the property from its historic location; isolation from or change of features within the property's historic setting; visual, atmospheric or audible intrusions; foreseeable effects that may occur later in time or farther removed in distance; and cumulative effects.

To be eligible for listing in the National Register and California Register, and as applied at the local level, a property must not only be shown to be historically significant under the applicable criteria (federal, state and local), but it must also have integrity. Integrity is defined as the ability of a property to convey its significance. Pursuant to CEQA, projects that may compromise the integrity of a property, and therefore, compromise its historical significance may be adverse.

The Secretary of the Interior's Standards for Rehabilitation (SOI Standards) are codified at 36 Code of Federal Regulations (CFR) Section 67.7. The SOI Standards are designed to ensure that rehabilitation does not impair the significance of a historic property. In most circumstances, the SOI Standards are relevant in assessing whether there is a substantial adverse change under CEQA. Section 15064.5b(3) of the CEQA Guidelines states in part that "... a project that follows the *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings or the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings* (1995), Weeks and Grimmer, shall be considered as mitigated to a level of less than a significant impact on the historic resource."

2. SECRETARY OF THE INTERIOR'S STANDARDS FOR REHABILITATION

As stated above, projects that may affect historic resources are considered to be mitigated to a level of less than significant, if they conform to the SOI Standards. Projects with no other potential environmental impacts qualify for a Class 31 exemption under CEQA if they meet the SOI Standards.[34]

The definition of "rehabilitation" assumes that at least some repair or alteration of a historic property will be needed in order to provide for an efficient contemporary use or maintain its historic use. However, these repairs and alterations must not damage or destroy materials, features, or finishes that are important in defining a property's historic character and significance.

[34] *14 CCR Section 155331.*

The ten standards for rehabilitation are as follows:

1. A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces, and spatial relationships.

2. The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces and spatial relationships that characterize a property will be avoided.

3. Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other historic properties, will not be undertaken.

4. Changes to a property that have acquired historic significance in their own right will be retained and preserved.

5. Distinctive materials, features, finishes and construction techniques or examples of craftsmanship that characterize a property will be preserved.

6. Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive historic feature, the new feature will match the old in design, color, texture, and, where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.

7. Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.

8. Archaeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.

9. New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterized the property. The new work shall be differentiated from the old and will be compatible with the historic materials, features, size, scale, and proportion, and mass to protect the integrity of the property and its environment.

10. New additions and adjacent or related new construction will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

The SOI Standards were developed by the NPS to assist property owners and managers in rehabilitating their historic properties. The SOI Standards contain a specific hierarchy for decision-making in assessing the rehabilitation of any historic building. First, the significant materials and features of a property must be identified. Then a method for their retention and preservation must be found. If the physical condition of character-defining materials warrants additional work, repair is recommended. If deterioration or damage precludes repair, then replacement can be considered.

In addition to the rehabilitation of character-defining features, the SOI Standards also address alterations and additions to historic properties, as well as retrofitting properties for health and safety requirements. Some alterations to a historic property may be needed to assure its continued use; however, these modifications should not obscure or destroy important character-defining features of the property or jeopardize those qualities that justify or convey the property’s historical significance.

B. PROPOSED PROJECT

In order to achieve the goals and objectives of the Vision 2020 Facilities Master Plan, the proposed project would involve the demolition of certain existing buildings; the renovation of existing buildings; and the construction and eventual operation of new buildings and campus facilities as illustrated in Figures 4-1 through 4-6. The proposed project would also involve improvements to the existing pedestrian circulation network in and around the campus and the enhancement of open space areas through landscape and pedestrian plaza improvements. Construction of the proposed project would result in the reconfiguration of existing parking lots and vehicular entryways, and the addition of a parking structure on an existing OC Fairgrounds lot.

Specific program- and project-level components include buildings and facilities and site improvements for the OCC campus (see Figures 4-1 and 4-2). Base on the information contained in the Vision 2020 Facilities Master Plan, some elements would be assessed for CEQA compliance at the program level because specific project details are not known at this time. A few of these elements are dependent upon a future joint-venture partnership between the District and a developer yet to be identified. Project-specific plans would be developed after the joint venture is initiated. Other proposed project elements have detailed information available and would receive project-level assessment.

1. Buildings and Facilities (New Construction)

Project Level

The project-level buildings and facilities proposed for new construction as a component of the project includes:

Administration Building. A new Administration Building would be constructed to house the Campus Administration offices, which include the offices of the OCC president, vice president, foundation, and public information. In addition, the public safety office, bursar's office, and classrooms would occupy the new Administration Building.

Planetarium. This proposed 8,234-square-foot facility would be used by the college and the community and would be sited to allow for public access from the Merrimac parking lot.

Student Union/Bookstore/Culinary Arts/Student Success Center. This project element is planned to be developed slightly north of the corner at Fairview Road and Merrimac Way.

Student Housing Project. This project component would include approximately 200,000 square feet of space and would be supported by a private partner. Construction would occur at the corner of Adams Avenue and the campus entry. Parking Structure. The District plans to construct up to a four-level parking structure for 2,000 vehicles on the existing Adams Avenue lot on campus.

New Multidisciplinary Building. A new Multidisciplinary Building is proposed south of the Adams Lot. The new building would house a variety of programs..

New Language Arts and Social Science Building. A new Language Arts and Social Science Building is proposed in the center of the campus, just south of Le Bard Stadium.

New Adaptive Physical Education, Gymnasium, Pool Facilities, and Division Office. New adaptive PE and fitness facilities, men's and women's locker rooms, and aquatic facilities suitable for athletic competitions, and a Division office are proposed east of the Adams Lot and north of the proposed Interdisciplinary complex.

New Chemistry Building. The District proposes to construct a new Chemistry Building which would total 30,741 ASF. The Chemistry Building would provide state-of-the-art science labs suitable for instruction in STEM careers. The Chemistry Building would be located in the center of campus, south of the Adams Lot.

Interdisciplinary Complex Phase 2 (Language Arts and Social Sciences Building). A new Language Arts and Social Sciences Building is proposed in the center of campus, just south of Le Bard Stadium and north of the central quad. The new building would be 77,587 ASF and would house language arts and social science programs. Construction would occur during Phase II (2017–2019).

Dance Building. The District proposes to construct a Dance Building, which would total 20,000 ASF. The Dance Building would be located west of the proposed Student Union/Bookstore/ Culinary Arts/Student Success Center facility and shall be immediately adjacent to the Robert B. Moore Theater. Construction would occur during Phase 3 (2019–2024).

Recycling Center Expansion and Circulation/Parking Improvements. The District proposes to expand the existing recycling center for the purposes of accommodating recycling demand in the City of Costa Mesa. The expansion would primarily enhance pedestrian and vehicular safety on approach to and within the recycling center. It would also provide greater on-site space for visitors to drop sorted recyclable materials at designated areas; landscaped frontage along Adams Avenue; an area for composting; raised planter beds; outdoor instructional space; a 2,500-square-foot covered storage area for trucks, forklifts, and equipment; and large modular spaces for storage. A 54-foot truck turnaround area would be provided for vehicles transporting recyclable materials off campus. The expansion of the site would also involve increasing the number of parking spaces from approximately 8 to 45 dedicated spaces. Expansions would be able to accommodate triple the amount visitors that the Recycling Center it currently receives.

PROGRAM LEVEL

The following is proposed to be analyzed at the program level because a specific development plan has not yet been proposed and a private development partner has not yet been identified. Once a specific plan of development is proposed, this element would be subject to further CEQA review: Thje Mixed-Use Development Concept. This project component would consist of commercial/retail uses and conferencing/office space.

2. BUILDINGS AND FACILITIES (RENOVATION)

PROJECT LEVEL

The project-level buildings and facilities proposed for renovation as a component of the project includes two existing buildings:

Administration Building (Watson Hall Renovation)

The renovated Watson Hall building would house the campus student services and administration offices, which include the offices of the OCC president, vice president, foundation, public information, and Student Service programs including Enrollment Services, Counseling, Financial Aid, Extended Opportunity Programs and Services (EOPS), Career Education, Transfer Center, CalWorks, and Student Equity.

Skill Center. Renovations would occur at the existing Skill Center building in order to meet instructional needs in advanced aerospace manufacturing technologies in aviation maintenance and welding labs.

3. Buildings and Facilities (Demolition)

Over a dozen buildings and facilities are proposed demolition under the Vision 2020 Facilities Master Plan. The table below summarizes those improvements proposed for demolition.

ID #	Building/Area	DOC	Status
14	Student Center (86)	1952	Non-Contributor
15	Administration Building (1)	1975	Non-Contributor
16a	Haley Business Learning Center (10)	1975	Non-Contributor

N/A	Quad Area Landscape/Hardscape Features	1950s	District Contributor

4. Site Improvements Elements

Site improvements proposed include parking and vehicular entry, pedestrian circulation, and site infrastructure improvements.

Parking/Vehicular Entry Improvements. Parking Lot E, located in the southwestern corner of the campus would be reconfigured to provide a primary entry from Merrimac Way, as well as two secondary entries from Merrimac Way. In addition, entries from Fairview would be enhanced with the addition of formal gateways and marked pedestrian drop-off points.

Pedestrian Circulation. The proposed project builds on the existing pedestrian paved pathways, completing the pedestrian connectivity around the central quad. Pedestrian pathways would be paved and landscaped to signify that they are entryways into the campus.

C. ANALYSIS OF PROJECT IMPACTS

The proposed project anticipates the demolition of all most of the existing core campus improvements, including the majority of contributing properties and landscape features to the potentially eligible OCC Campus Historic District. The existing setting of the core campus area would be re-designed and re-configured in a manner that would destroy all semblance of the historic character of the site and those qualities that convey the district's historical significance, period of significance, and eligibility to the California Register and local City of Costa Mesa landmark list. The demolition, re-configuration, and re-design of contributing resources as proposed by the current project would result in significant adverse impacts under CEQA. These impacts cannot be mitigated to a less-than-significant level. Nonetheless, mitigation measures are still required.

5. Mitigation Measures

A. CEQA Mitigation Approaches

According to CEQA, mitigation may include:

- Avoiding the impact altogether by not taking a certain action or parts of an action;
- Minimizing impacts by limiting the degree or magnitude of the action and its implementation;
- Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment;
- Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action;
- Compensating for the impact by replacing or providing substitute resources or environments;[35] and
- Utilizing the Secretary of the Interior's Standards of Rehabilitation and Guidelines for Rehabilitating Historic Buildings.[36]

B. Consideration of Mitigation Measures

CEQA requires the Lead Agency to examine and impose mitigation measures or feasible project alternatives that would avoid or minimize any impacts or potential impacts to historic resources.

When identified historic resources are involved, avoidance or preservation in place is the preferable course of action. When total avoidance or preservation in place is not possible, a hierarchy of treatment approaches should be examined and assessed for feasibility. Such treatment approaches may include partial retention, relocation, or reconstruction. Demolition and recordation under CEQA are not considered acceptable treatment approaches as recordation does not address the adverse change resulting from the determination of the

---

35 *CEQA Guidelines, Section 15370.*

36 *CEQA Guidelines, Section 15064.5(b)(3).*

physical characteristics that justify the inclusion of the resource in the California Register and/or local landmark register.

C. PROJECT MITIGATION MEASURES

Under the proposed project, the majority of contributors to the identified OCC Historic District would be removed for the development of an open landscaped quad area. The following mitigation measures shall be required to document the important history and architecture of the site and its overall historical association with the early development of the OCC campus. Note that even with the following mitigation measures, the identified adverse impacts caused by the implementation of the proposed project would not be mitigated to a less than significant level.

Recordation

A Historic Structures Report shall be prepared prior to any alteration, relocation, or demolition of any contributing buildings, structures, objects, features, or landscape elements located within the identified OCC Historic District. The work shall be completed by a qualified historic preservation professional who meets the requirements of the U.S. Secretary of the Interior’s Professional Qualifications for history, architectural history, or historic architecture. The report shall be prepared in a manner consistent with the recommended approaches outlined in the National Park Service *Preservation Brief 43: The Preparation and Use of Historic Structures Reports*. The report shall document the significance and physical condition of all contributing buildings, structures, objects, features, and landscape elements with photographs, text narrative, and existing drawings. This documentation shall include at a minimum:

- A written historic and descriptive report completed in narrative format, including an architectural data form for each contributing resource.

- A site plan showing the location of each building. This site plan shall include a photo key.

- A sketch floor plan shall accompany each architectural data form.

- Large format (4” x 5” or larger negative) photographs in accordance with Historic American Buildings Survey (HABS) guidelines and standards. Views shall include contextual views, all exterior elevations, details views of significant exterior architectural features, and interior views of significant historical architectural features or spaces.

- Field photographs (digital) based on HABS guidelines to ensure full documentation of the site. Views should correspond to and augment those in the large format photographs. Such photographs shall be logged, tagged, and collected onto a media storage device for safe archiving.

- Available historic photographs and historic and/or current as-built plans of the site and its contributing resources shall be reproduced digitally or photographically and included in the recordation document.

One original copy of the documentation as specified above shall be assembled and offered to each of the following entities:

- One set shall be sent to the Southern California Information Center at California State University, Fullerton.

- One set shall be offered to and, if accepted, deposited in the archives of the Los Angeles Conservancy.

- One set shall be offered to and, if accepted, deposited in the archives of the University of California, Irvine.

- One set shall be offered to and, if accepted, deposited in the archives of the City of Costa Mesa Public Library.

- One set shall be offered to and, if accepted, deposited in the archives of The Huntington Library, Art Collections, and Botanical Gardens.

- One set shall be offered to and, if accepted, deposited in the archives of the Neutra Institute for Survival Through Design.

- One set shall be offered to and, if accepted, deposited in the archives of the Los Angeles Conversancy.

- One set shall be offered to and, if accepted, deposited in the archives of the Orange County Archives.

- One set shall be offered to and, if accepted, deposited in the archives of the Costa Mesa Historical Society.

Salvage and Reuse of Key Features.

Prior to demolition of any contributing resources, including landscape elements, within the OCC Historic District, an inventory of significant exterior character-defining features, distinctive architectural elements, and materials shall be made by a qualified historic preservation professional who satisfies the U.S. Secretary of the Interior's Professional Qualifications for history, architectural history or historic architecture. Where feasible these features shall be itemized, photographed, salvaged, and incorporated into the new design of the campus pursuant to the 2020 Facilities Master Plan. To the extent salvageable materials exceed on-site reuse needs, they may be sold, donated, or exchanged for use elsewhere in the community. Unsound, decayed, or toxic materials (e.g. asbestos, etc.) need not be included in the salvage process. Some materials shall also be incorporated into an educational interpretive program as discussed as part of the following mitigation measure. Salvage efforts shall be documented by summarizing all measures taken to encourage receipt of salvaged materials by the public.

Interpretive Educational Program

To assist the students, faculty, parents, other interested parties in understanding the early history of OCC, an interpretive multi-media educational program and 3-D public art display shall be incorporated into the development of the reconfigured campus quad area and/or campus library. This interpretive program and public art work shall be developed with the assistance of a qualified architectural historian or historic preservation professional who satisfies the Secretary of the Interior's Professional Qualifications. Content and design of the interpretive program should be specific to OCC, specifically the architecture and historical development of the campus. The program/display may include but not be limited to: commemorative signage; plaques; enlarged and framed historic photographs; representative statues; salvaged materials; models; display of as-built plans and drawings; educational interactive CD software program; other relevant displays and exhibits; tours or events; and published information in the form of brochures, pamphlets, videos, electronic media, campus web site, etc.

6. LEVEL OF SIGNIFICANCE AFTER MITIGATION

Under CEQA, the mitigation measures required herein would reduce, but not eliminate the significant impacts of the proposed project to the identified historic district and its contributing resources. The substantial demolition of the buildings, structures, objects, features, and landscape elements that comprise the OCC Historic District would result in a substantial adverse change to the historic property (the historic district) and the environment. The impact to the OCC Historic District cannot be mitigated to a less than significant level. Nevertheless, the measures outlined for documentation of the District, the salvage and reuse of significant character-defining features, and the development of an interpretative educational program(s) are important to assure that information regarding the historical development of the college campus, its association with master architect Richard Neutra, and its physical manifestation of Modern style educational facilities are documented, retained, archived, and promoted.

EPHEMERAL MATERIAL AND PHOTOGRAPHS

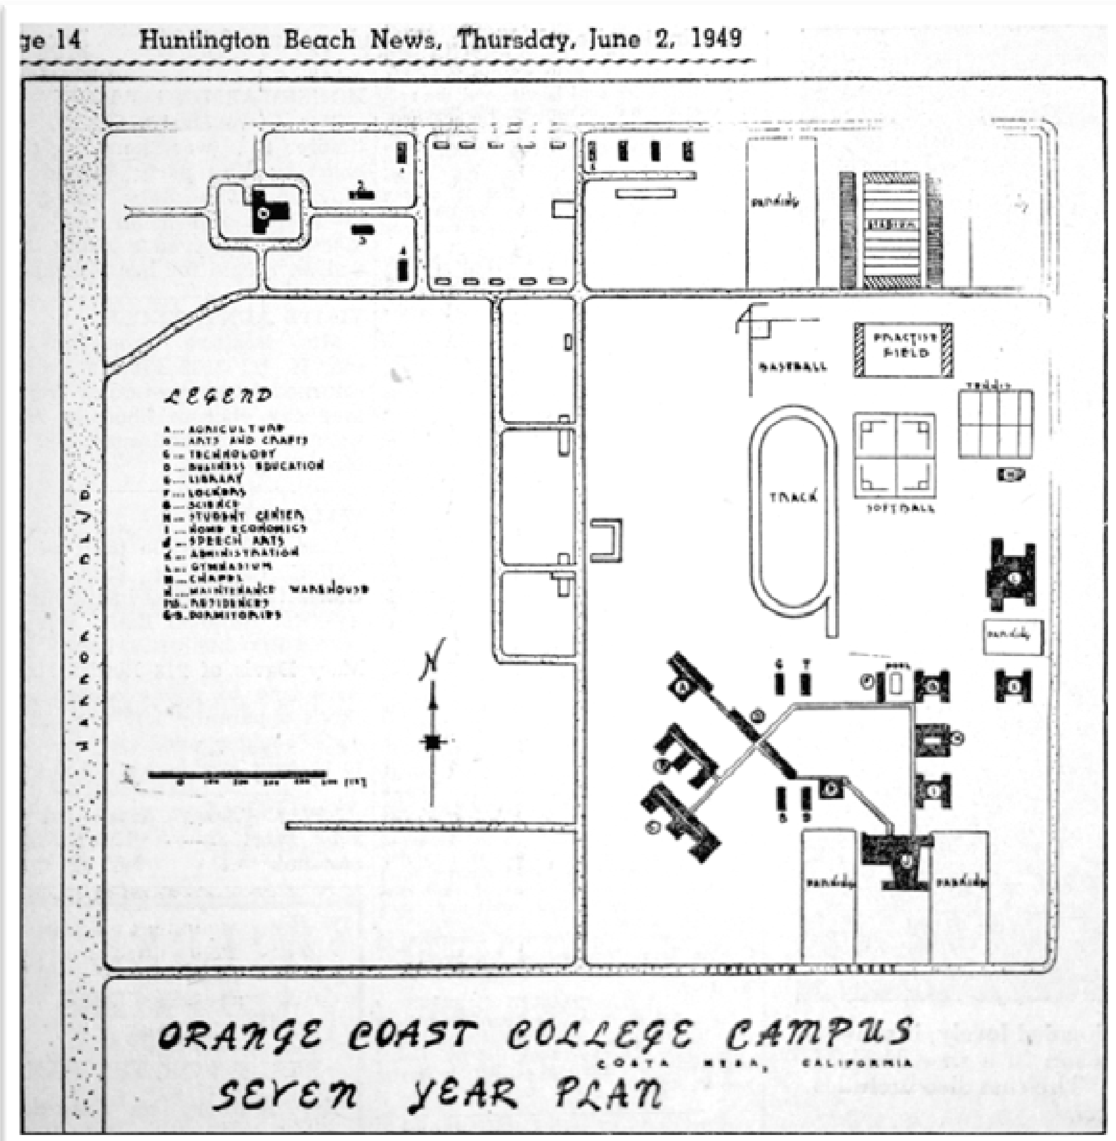

PHOTO - 1: The initial master plan for the campus from 1949.

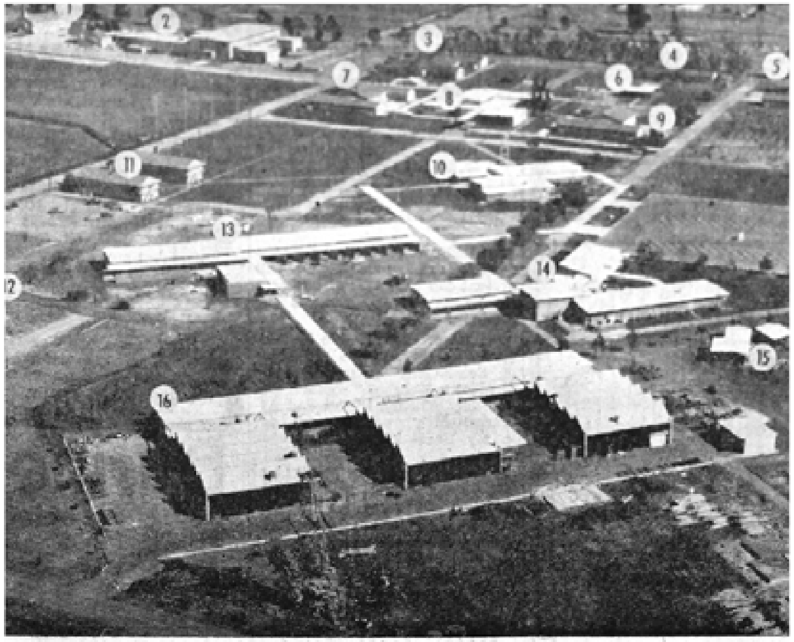

COLLEGE EXPANSION—From the air, looking towards the northeast, Orange Coast College campus appears as shown above. As the fifth year of the seven year building program gets underway the campus is gradually including all the facilities needed to make it an outstanding college. Building of an auditorium is scheduled to begin around January 1, and an athletic stadium will be started during the spring of 1955. Structures may be identified as follows: (1) memorial chapel, (2) swimming pools* and gymnasium, (3) administration, (4) nursing arts, (5) commerce, (6) home management cottage* **, (7) science, (8) student center*, (9) home economics, (10) library*, (11) men's dormitories, (12) agriculture classroom, (13) business education*, (14) art center*, (15) employee dwellings* **, (16) technology*. (* indicates new buildings, ** indicates built by building construction classes).

D1. Historic Name: *Orange Coast College* D2. Common Name: *OCC-Orange Coast College*

D3. Detailed Description (Discuss overall coherence of the district, its setting, visual characteristics, and minor features. List all elements of district.):

The Orange Coast College District is located in the City of Costa Mesa, a developed community within the jurisdiction of Orange County. Composed of five buildings arranged on the campus of Orange Coast College, the district lies between Fairview Road on the east, Adams Avenue on the north, Merrimac Way on the South, and a residential area to the west (See Continuation Sheet 3 of 4).

D4. Boundary Description (Describe limits of district and attach map showing boundary and district elements.):

The district is bounded on the north by Adams Avenue and on the west by a residential neighborhood. It is bounded on the south by Merrimac Way and on the east by Fairview Road.

D5. Boundary Justification:

D6. Significance: Theme *Education* **Area** *Costa Mesa*

Period of Significance **Applicable Criteria** Discuss district's importance in terms of its historical context as defined by theme, period of significance, and geographic scope. Also address the integrity of the district as a whole.)

Richard Neutra world renowned international style architect established a partnership with architect Robert Alexander during the 1950s. The agreed upon scope for the Neutra and Alexander work was confined to the "big" areas of planning and of public and commercial architecture, conducted in an office in Glendale. As a team, Neutra and Alexander were probably best on these planning projects of the early 1950s. In formulating the plans, each made basic conceptual contributions, with Neutra taking chief responsibility for architectural design and Alexander assuming control of planning, organization, and logistics. One of the ongoing commissions Alexander brought to the partnership was for the developing Campus of Orange Coast College (See Continuation Sheet 4 of 4).

D3. Detailed Description

The five resources are:

The Science Building (Building Nos. 35 and 36)

The Speech Arts and Theatre Building (Building No. 2)

The Business Education Building (Building Nos. 12 and 13)

The Football Stadium (Building No. 135)

The Swim Stadium and Gymnasium (Building Nos. 91, 93, and 94)

D6. Significance

In the early fifties Neutra contributed design ideas for a business education building, a science building, an athletic facility, and a speech arts and music center with a large theatre.

The Orange Coast College, a building complex developed over a period of years, comprises: Speech Arts and Music Center, Business Education, Stadium, Swimming pool, Science Group with planetarium.

The Speech Arts and Music Center with its grand "aula" or auditorium occupies a prominent location at the hub of the campus. The requirements for the Center were drawn up in close cooperation with the teaching staff concerned with the study of language, voice, dramatics, and instrumental music. Student representatives also took part in the program deliberations since student participation in the preparation and performance of the theatrical events was of prime importance. These events were to vary from intimate and small-scale productions to those of larger scale and dramatic pageantry. The college was then particularly interested in exploring the "theatre-in-the-round" as well as the "audience-in-the-round" techniques. Provisions for these and for various types of musical production were considered in the design.

The "theatre-in-the-round" takes place right on the stage itself where strong tables of different heights are designed as removable and adjustable seat platforms, allowing several patterns for audience seating. A pair of revolving stages add to the flexibility of uses as do the two side stages which permit the dramatic action to extend around the audience. Huge motor-driven doors open the stage to the outdoor amphitheater.

Because it was planned in incremental stages over a period of years, the campus lacked a central unifying orientation that would have strengthened the aggregate of competent, though unspectacular architecture. However, even with this design flow, Neutra's signature style - International is apparent in these campus buildings. Key elements of this style include: the Science Building; the Speech Arts and Theatre Building; the Business Education Building; the Football Stadium and; the Swim Stadium and Gymnasium.

December 2, 2013

TABLE OF CONTENTS

Figures

Tables

1.0 INTRODUCTION

This paleontological assessment was prepared at the request of Dudek in order to evaluate the paleontological resource potential of the Orange Coast College campus (the Project) located in the City of Costa Mesa, County of Orange, California (Figure 1).

The study was performed in accordance with the California Environmental Quality Act (CEQA) (Public Resources Code, §21000 et seq.), State CEQA Guidelines (California Code of Regulations, Title 14, §15000 et seq.), County of Orange Guidelines, and the City of Costa Mesa General Plan (Eisentraut and Cooper, 2002; Costa Mesa, 2000). Ms. Sarah Siren, M.S., Project Manager/Principal Investigator (Paleontology), conducted the pedestrian survey, the institutional records search, and co-authored this report with Ms. Geraldine Aron, M.S. Report review was provided by Paul C. Murphey, Ph.D., and GIS mapping was provided by Mr. Mark Deering. The goal of this report is to identify the paleontological sensitivity of the Project area and develop recommendations for the mitigation of adverse effects on paleontological resources that may result from the proposed construction.

2.0 PROJECT LOCATION AND DESCRIPTION

The Orange Coast College campus is an approximately 164-acre site located at 2701 Fairview Road, north of Merrimac Way, west of Fairview Road, south of Adams Avenue, and east of Harbor Boulevard, in the City of Costa Mesa, California. The campus can be accessed from Interstate (I-) 405 to the north, State Highway 55 to the southeast, and State Highway 73 to the northeast (Figure 1). Residential communities generally surround the campus to the north, west, and south. The Costa Mesa Farm Sports Complex, High School, and Arlington Pacific Amphitheater are located opposite the campus on the east side of Fairview Road (Figure 1). The Project area, as seen on a portion of the USGS Newport Beach, California 7.5-minute Topographic Quadrangle map (1965 edition, photorevised 1981), is located in an unsurveyed portion of Township 6 South, Range 10 West (San Bernardino Meridian).

The proposed development will involve improvements to the Orange Coast College campus, including construction of taller buildings and recreational facilities. Requisite improvements to existing infrastructure such as road expansion and inclusion of preservation areas will also accommodate the campus redevelopment.

3.0 METHODS

The paleontological study of the Project area included a review of regional geologic mapping and relevant reports, a literature search, an institutional records search, a review of previous paleontological investigations in the area, and an on-site field survey.

3.1 Records Search

A paleontological records search was conducted by Samuel McLeod, Ph.D., of the Vertebrate Paleontology Section of the Natural History Museum of Los Angeles County (LACM). The results of the records search dated October 17, 2013, are attached (Appendix A).

3.2 Literature Search

The literature reviewed included published scientific papers that were found at the library of the Biodiversity Research Center of the Californias, San Diego Natural History Museum; the Journal of Vertebrate Paleontology; and digitized publications obtained on internet sources such as GeoRef, GeoPub, GeoTracker, Science Direct, and Web of Science.

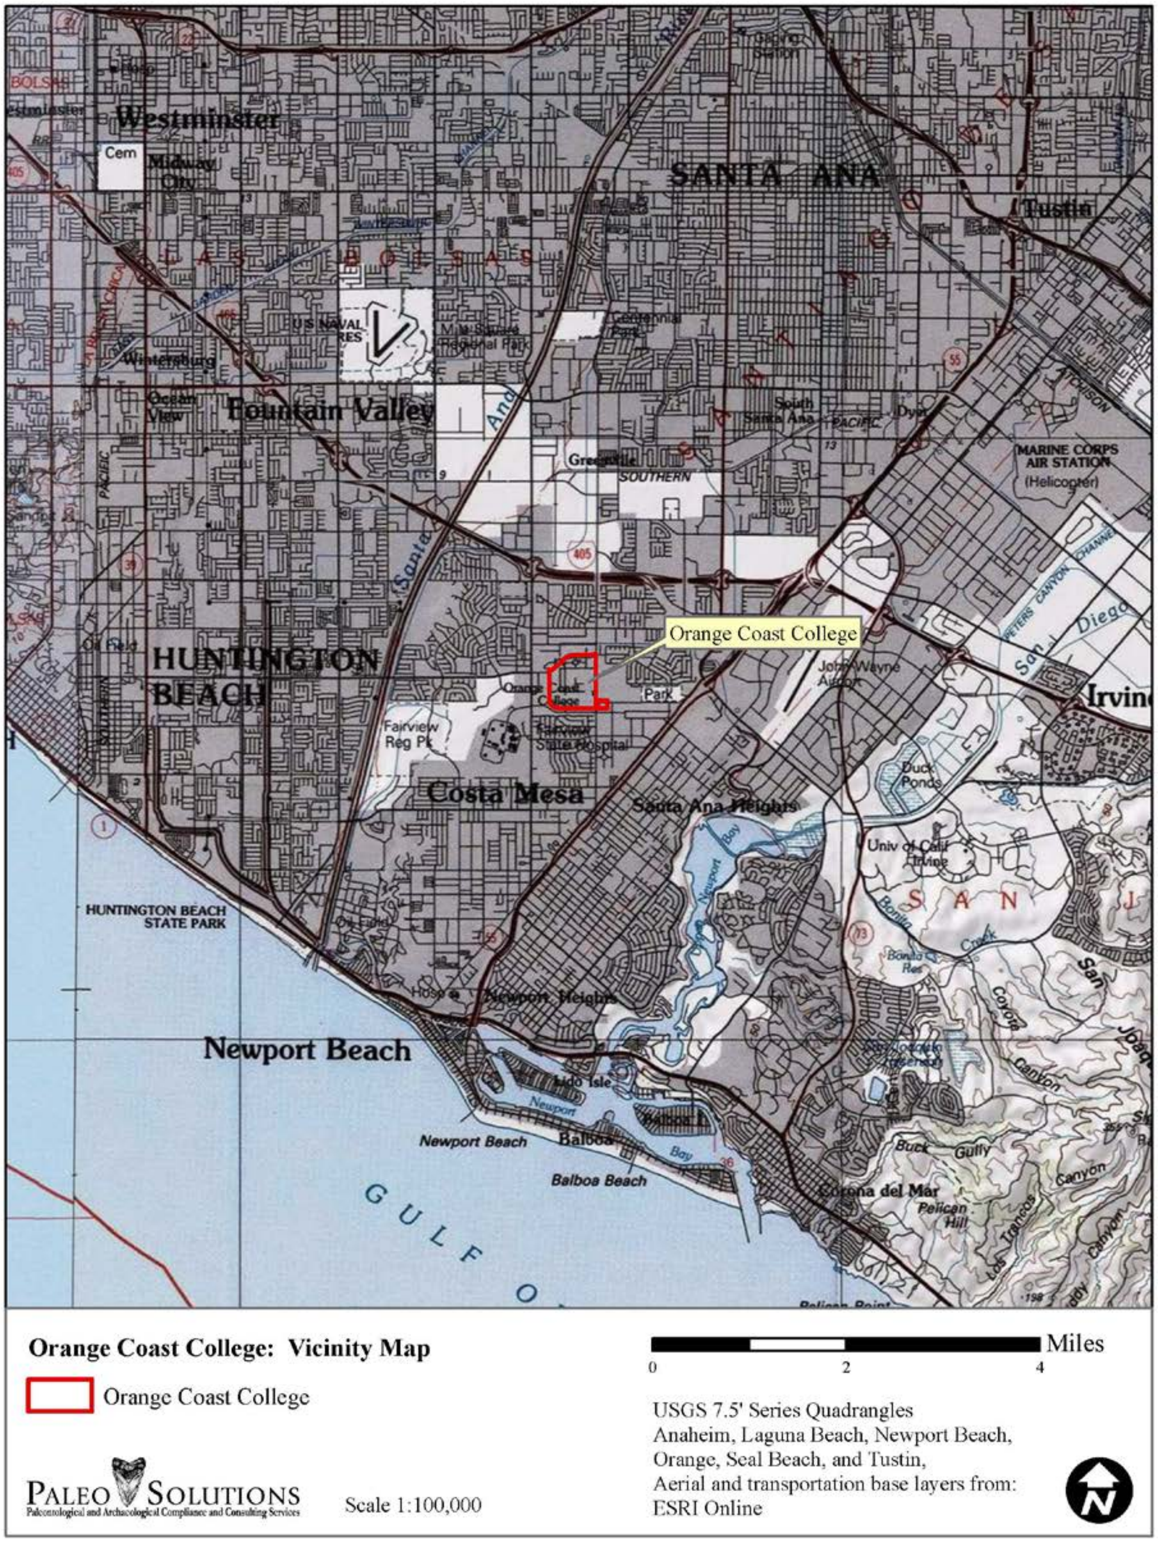

Figure 1. Index map of the western coast of Orange County, with the Orange Coast College campus, outlined in red, in the City of Costa Mesa, California.

3.3 Geologic Map Review

Paleo Solutions, Inc. (Paleo Solutions) reviewed both published geologic mapping (Morton and Miller, 2006) and unpublished reports (Chambers Group, Inc., 2007) for the area as part of this assessment.

3.4 Field Survey

A pedestrian survey of the property was conducted on October 29, 2013, by Sarah Siren, M.S. The survey included both an examination of outcrops for surface fossils and an assessment of the potential for occurrences of subsurface fossils.

4.0 REGULATORY REQUIREMENTS

This section of the report presents the regulatory requirements that will apply to the Project.

4.1 Federal Regulations and Laws

There are no federal regulations related to paleontological resources that apply to the Project.

4.2 State and Local Regulations and Laws

The procedures, types of activities, persons, and public agencies required to comply with the CEQA are defined in the *Guidelines for Implementation of CEQA* (State CEQA Guidelines), as amended on March 18, 2010 (Title 14, Section 15000 et seq. of the California Code of Regulations [i.e., 14 CCR Section 15000 et seq.] and further amended January 4, 2013. One of the questions listed in the CEQA Environmental Checklist is: "Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?" (State CEQA Guidelines Section 15064.5 and Appendix G, Section V, Part C).

The *County of Orange General Plan* by Eisentraut and Cooper (2002)—based on the Society for Vertebrate Paleontology (SVP) recommendations—is used in part because it provides a convenient and locally useful way to address the paleontological sensitivity of formations. The formations that occur within Orange County have been assigned a sensitivity ranging from very high to none (Eisentraut and Cooper, 2002). The City of Costa Mesa General Plan, specifically the Historic and Cultural Resources Element (2000), provides an outline for the protection and preservation of resources.

According to the Historic and Cultural Resources Element of the City of Costa Mesa General Plan (2000):

> "The goals, objectives and policies that address Historic and Cultural Resources Element are as follows:
>
> GOAL HCR-1: HISTORIC RESOURCE CONSERVATION
> It is the goal of the City of Costa Mesa to provide its citizens with a high quality environment through the protection and conservation of historic and cultural resources.
>
> Objective HCR-1A. Encourage the preservation and protection of the City's natural and man-made historic resources.
>
> HCR-1A.1 Require, as part of the environmental review procedure, an evaluation of the significance of paleontological, archaeological, and historical resources and the impact of proposed development on those resources."

5.0 RESOURCE ASSESSMENT CRITERIA

According to the County of Orange Curation Guidelines (Eisentraut and Cooper, 2002), impacts to paleontological resources range from zero to very high depending upon the resource sensitivity of the impacted geologic formations. The specific criteria applied for each sensitivity category are summarized below.

Very High Sensitivity

Very high sensitivity is applied to sedimentary deposits that yield scientifically very significant fossils, that give us insight into a particular time period, and those fossils which are very important for research. Formations that are included in this category are: the Capistrano Formation, the Monterey Formation, the Topanga Formation, the Sespe Formation, and southern Orange County exposures of the Santiago Formation (Eisentraut and Cooper, 2002). None of the units underlying the Project area are considered to have a very high paleontological sensitivity.

High Sensitivity

High sensitivity is assigned to geologic formations known to contain paleontological localities with rare, well-preserved, critical fossil materials for stratigraphic or paleoenvironmental interpretation, and fossils providing important information about the paleobiology and evolutionary history (phylogeny) of animal and plant groups. Generally speaking, highly sensitive formations produce vertebrate fossil remains or are considered to have the potential to produce such remains. Geologic units that have been assigned a high paleontological resource sensitivity that crop out elsewhere in Costa Mesa include the Pleistocene Old Paralic Deposits (also referred to as terrace deposits). These high sensitivity sedimentary deposits include the Pleistocene age marine and non-marine terrace deposits (older alluvium) that are presumed to underlie younger, alluvial fan deposits mapped within the Project area.

Moderate Sensitivity

Moderate sensitivity is assigned to geologic formations known to contain paleontological localities with poorly preserved, common elsewhere, or stratigraphically unimportant fossil material. The moderate sensitivity category is also applied to geologic formations that are judged to have a strong, but unproven potential for producing important fossil remains. Geologic deposits that have been assigned a moderate paleontological resource sensitivity that are documented elsewhere in Orange County include the San Pedro Sand (McLeod, 2013; Eisentraut and Cooper, 2002).

Low Sensitivity

Low sensitivity is assigned to geologic formations that, based on their relatively youthful age and/or high-energy depositional history, are judged unlikely to produce important fossil remains. Typically, low sensitivity formations produce poorly-preserved invertebrate fossil remains in low abundance. Due to the young age and coarse-grained nature of younger alluvium, these surficial sedimentary deposits are generally considered to have little potential to yield scientifically significant fossils. However, on occasion deeper excavations into sedimentary deposits mapped as younger alluvium penetrate into alluvial deposits of Pleistocene age and do yield fossils. None of the units underlying the Project area are considered to have a low paleontological sensitivity.

None Sensitivity

Sedimentary deposits designated as having no sensitivity is assigned to geologic formations that are entirely igneous in origin (i.e., plutonic and/or volcanic), and therefore have no potential for producing fossil remains. Volcanic ash deposits can represent an exception to this general rule and preserve fossils as both body fossils or natural casts. Artificial fill materials are also assigned a paleontological resource sensitivity of none.

6.0 GEOLOGY AND PALEONTOLOGY

6.1 Geologic Summary

The Project area is the campus of Orange Coast College, in the City of Costa Mesa, California (Figure 1). This portion of Orange County lies within the Coastal Los Angeles Basin of southern California (Fram and Belitz, 2012) (Figure 1). As stated in the Draft Program EIR by Chambers Group, Inc. (2007):

> *"Costa Mesa lies adjacent to the to the Downey and Tustin portion of the Coastal Plain, where sedimentary and volcanic rocks in the subsurface attain great thickness. These deposits are composed mainly of volcanic, marine and nonmarine sedimentary rocks overlying a basement of granitic and metamorphic rock. The plain is immediately underlain by a thick sequence of alluvial sediments, which overlie the older sedimentary and volcanic rocks."*

Surficial deposits within the campus are entirely mapped as old paralic deposits (Qopf; less than 500,000 years old) (Morton and Miller, 2006). The campus itself is relatively flat-lying in this developed portion of Costa Mesa. Recent deposits (Holocene; 10,000 years or younger) occur below and adjacent to the I-405 freeway due north of the Orange Coast College campus (Morton and Miller, 2006; shown on maps as the designation Qya) (Figure 3).

Pleistocene-age fossils have been found at shallow depths in surficial sedimentary deposits throughout southern California (Jefferson, 1991). It is likely that Pleistocene age deposits underlie the campus at depth, and these deposits are known to produce Ice Age fossils elsewhere in Costa Mesa. Older paralic deposits of the same age have been documented during nearby development projects in Costa Mesa, and are presumed to underlie the younger alluvial fan deposits mapped within the Project area, but at an unknown depth (Morton and Miller, 2006). Older marine Quaternary terrace deposits are visible in the bluffs above the Santa Ana River due west of the Orange Coast College campus (McLeod, 2013) (Figure 2).

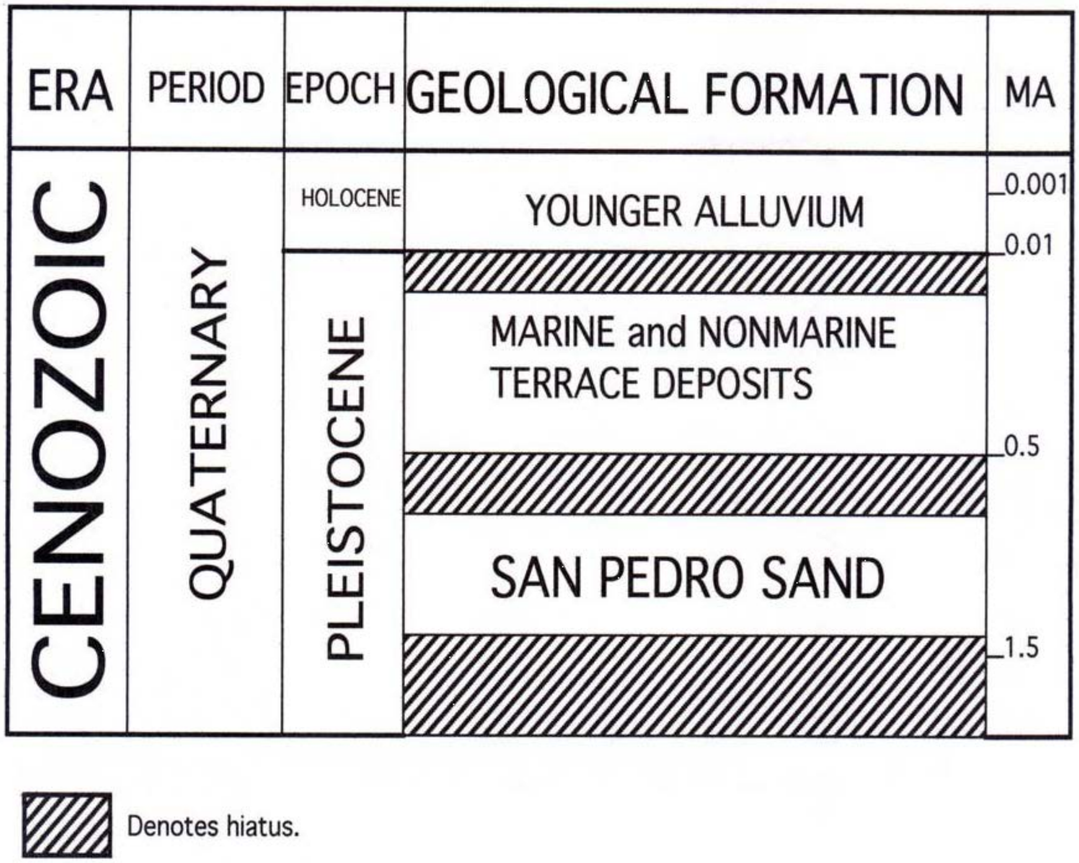

Figure 2. Stratigraphic relationship of younger alluvium, terrace deposits, and the San Pedro Sand, as they occur in Costa Mesa, and as referenced in the records search results by McLeod, 2013 (modified from Eisentraut and Cooper, 2002).

6.2 Old paralic deposits overlain by alluvial fan deposits (Qopf)

6.3.1 Description

These late to middle Pleistocene age (less than 500,000 years old) old paralic deposits are described by Morton and Miller (2006) as being "capped by extensive but thin, discontinuous, younger, locally derived, sandy alluvial fan deposits," and were derived from local streams draining from the surrounding mountains. Old paralic, or marginal marine, deposits of Pleistocene age may also be encountered at unknown depths below younger alluvial fan deposits. The old paralic deposits themselves consist of "poorly sorted, moderately permeable, reddish-brown, interfingered strandline, beach, estuarine and colluvial deposits composed of silt, sand and cobbles" (Morton and Miller, 2006).

6.3.2 Paleontology

Pleistocene geologic units are mapped within the Project area and have been assigned a high sensitivity based on their potential to yield significant, Ice Age mammals elsewhere in Costa Mesa (McLeod, 2013) (Appendix A).

Scientifically significant paleontological resources have been recovered from correlative Pleistocene older alluvial deposits throughout southern California and include fossil plants, invertebrates, and mammals (e.g., ground sloth, rodents, horse, tapir, camel, deer, llama, mastodon, and mammoth) (Jefferson, 1991; Reynolds and Reynolds, 1991; Anderson et al., 2002; Springer et al., 2009; 2010; Scott, 2010). Previously, Pleistocene megafauna remains were typically found in mass accumulations, such as Rancho La Brea, and Cousteau Pit, or singly in stream deposits in the centers of more low-lying basins. Discoveries of Pleistocene megafauna in the terrace deposits are a relatively new phenomenon, largely associated with construction projects along the coast of southern California. Old Pleistocene age deposits, although not visible at the surface during the pedestrian survey, have the potential to yield significant paleontological resources, and have been assigned a high paleontological resource sensitivity (McLeod, 2013) (Appendix A).

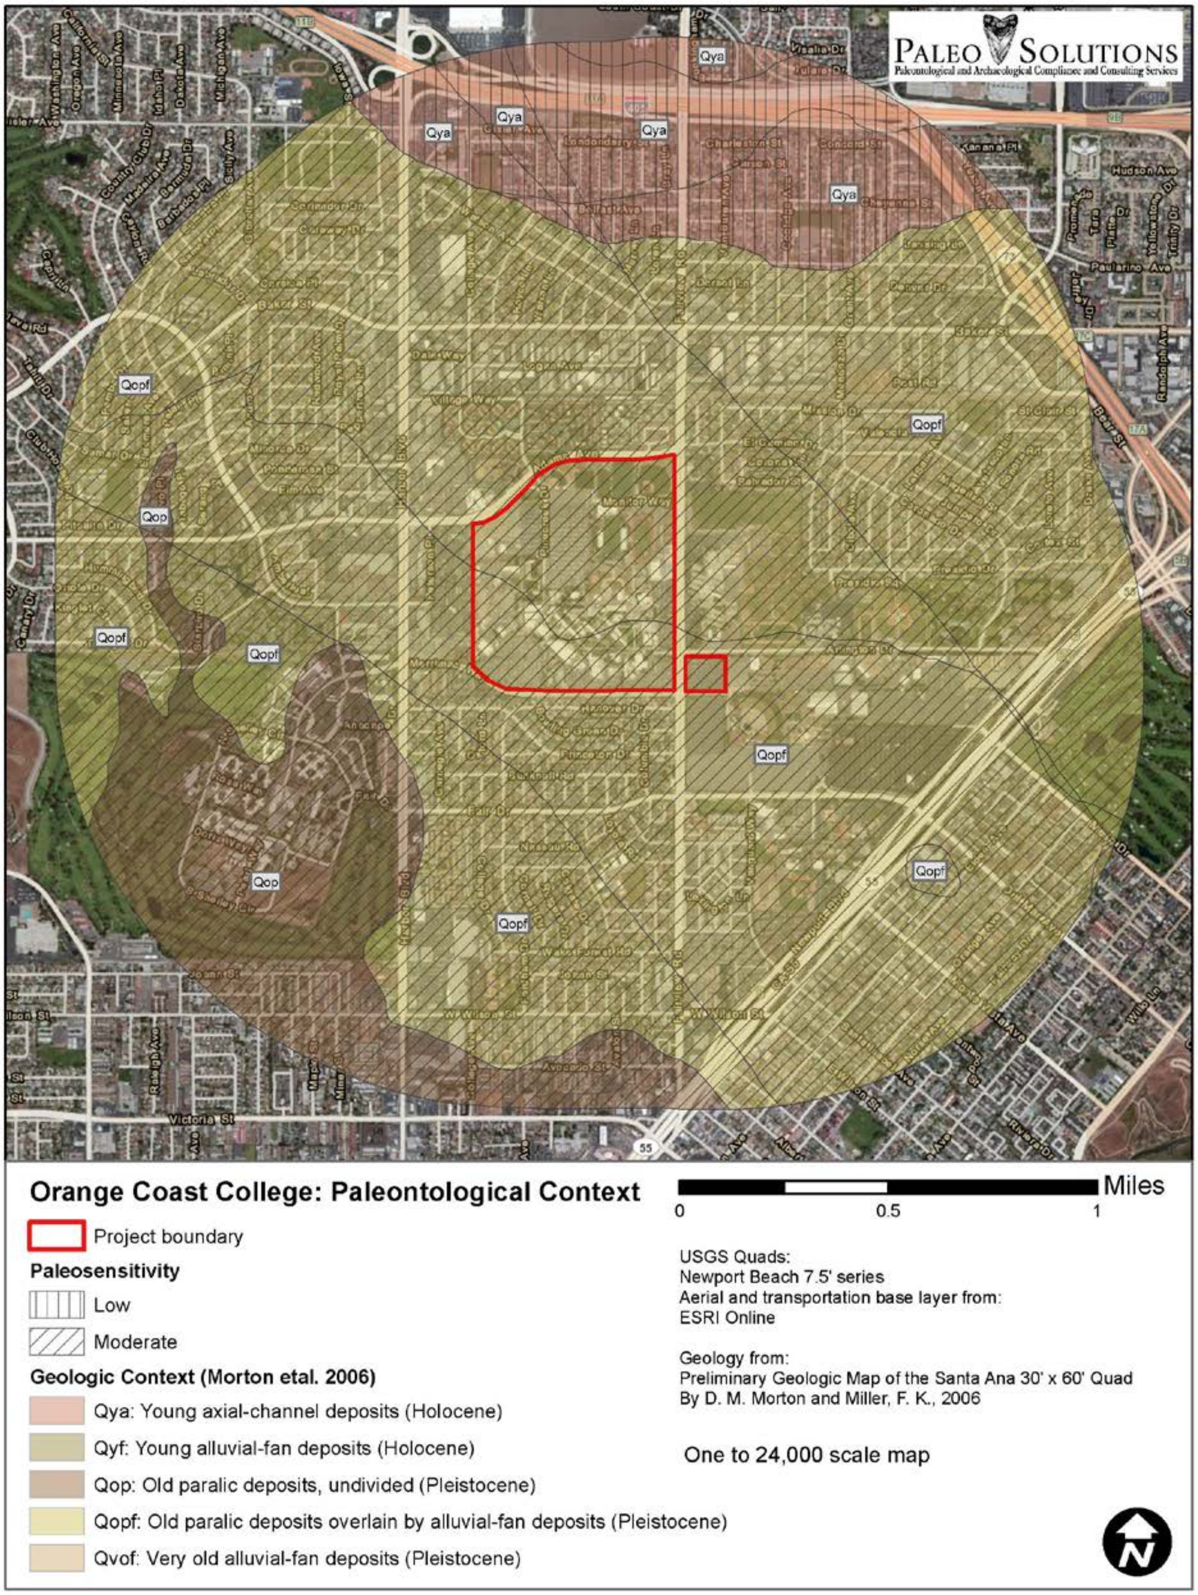

Figure 3. Geologic map overlain on an aerial photograph of the Project area and surrounding region (from Morton and Miller, 2006).

7.0 RESULTS

7.1 Museum Records Search

According to the records search (McLeod, 2013), there are no documented fossil localities within a one-mile radius of the Project boundary. However, the LACM does have a number of previously recorded fossil localities from Pleistocene age sedimentary deposits in the Costa Mesa area (McLeod, 2013; Appendix A), and these same age deposits underlie the Project area at a shallow depth. Such deposits have yielded the fossilized remains of mammoth and extinct camel, among others (McLeod, 2013).

As reported by McLeod (2013), a number of LACM fossil collecting localities are known from older Quaternary deposits in Costa Mesa. These include LACM 1339, located due west of the Orange Coast College campus, east of the Santa Ana River channel along Adams Avenue. This locality produced fossil mammoth and camel bones in sand from approximately 15 feet below the mesa bluffs, and just over a mile and a half west of the campus (McLeod, 2013). Another fossil locality, LACM 4219, located southeast of the campus, produced both fossil sea turtle and camel remains from sands 30 feet below the ground surface near Santa Isabel Avenue. Additional localities are documented further to the south in the Upper Newport Bay region of Orange County (McLeod, 2013; Barnes et al., 2013).

7.2 Resource Assessment

The following table is generated using the County of Orange guidelines (Eisentraut and Cooper, 2002) and the currently available geologic mapping. Based on the results of the literature and museum records searches, the geologic formations in the Project area are individually ranked (Table 1).

Table 1. Rankings of units that are found underneath the Orange Coast College campus

Unit Group	Map Abbreviation	Age	Typical Fossils	SensitivityRanking
Old Paralic Deposits overlain by Alluvial Fan Deposits	Qopf, and similarly aged deposits	Pleistocene	Ice Age Mammals	High

7.3 Field Survey

On October 29, 2013, the areas of impact that had the potential to impact paleontologically sensitive sediments during construction were surveyed. Particular attention was paid to exposed ground surfaces and areas of recent excavation on the Orange Coast College property.

Construction for the development has the potential to impact paleontologically sensitive sediments, as the entire area is underlain by relatively shallow deposits (Morton and Miller, 2006)

(Figure 3). These Pleistocene age deposits occur within the Project area, and may yield significant paleontological resources. Scattered brush and the developed nature of the campus made it difficult in some areas to interpret the surficial geology and paleontological potential (Figures 4 through 9).

Figure 4. View south from the northern portion of the Orange Coast College Campus on Adams Avenue, between Pinecreek Drive and Fairview Road.

Figure 5. View north toward Drama Lab from the parking lot in the southeastern portion of the campus.

Figure 6. View north from edge of parking lot located southwest of S Street and Adams Avenue on the Orange Coast College Campus.

Figure 7. Newly planted trees and exposed, surficial sedimentary deposits on campus southwest of the intersection between S Street and Adams Avenue.

Figure 8. Same location as Figure 5. Map view of water line installation and exposed ground surface.

Figure 9. Same location as Figure 6. Close up of utility building with exposed ground surface at the base.

8.0 POTENTIAL RESEARCH

Construction activities for the Project have the potential to impact deeper sediments that may contain scientifically important fossil remains in areas where buried native sediments are disturbed. Because such a large portion of California is urbanized and covered by development or agriculturally disturbed, opportunities to collect new fossils and paleontological data from Pleistocene age sediments are largely restricted to construction projects that disturb these sediments and reveal the fossils that are preserved in them.

The fossils found in older alluvium in California provide critically important paleoecological and paleoenvironmental data. They provide direct evidence of the composition and phylogenetic diversity of the Pleistocene biota, paleobiologic features of individual taxa, and evolutionary relationships of the fauna and flora through time. In combination, the fossil assemblages at individual localities, together with the sediments in which they are preserved, also provide indirect evidence of the nature of Pleistocene climates and environments, and importantly, the geographic distributions of different paleoenvironment types such as the fluctuating ocean shorelines, locations of inland lakes and swamps, upland habitats, and lowland habitats such as basin floors. It is important to bear in mind that the type and scope of research that can be accomplished for a paleontological construction mitigation project is entirely dependent upon the types and numbers of fossils that are discovered and their sediment logical context. If no fossils are discovered, then no paleontological research will be possible.

Despite the relatively rich Pleistocene fossil record of California, the timing of the transition from the Irvingtonian to the Rancholabrean North American Land Mammal Age (NALMA) is poorly documented and hence not well understood. For example, the first appearance (stratigraphically lowest) of the bison marks the beginning of the Rancholabrean NALMA, but there are few identifiable and stratigraphically well documented specimens of bison known from California, and those that do exist are not associated with reliable age dates. Thus, the timing of the beginning of the Rancholabrean is in question, and may be older or younger than the estimate of 300,000 years BP (before present) that has traditionally been accepted by paleontologists. In addition to the timing of the Irvingtonian-Rancholabrean transition, the composition of the faunal assemblages that comprise these biochronologic intervals and the finer details of faunal composition and change within them are also not well understood and remains problematic. Traditionally, larger mammals have been designated as index fossils and have been the focus of biostratigraphic efforts since the provincial NALMA system was codified by the Wood Committee in 1941. However, more recent work, especially on the Eocene biostratigraphy and biochronology of San Diego and Ventura counties (e.g. Walsh, 1996; Whistler and Lander, 2003), has demonstrated the value of utilizing small mammals because of their phylogenetic diversity, but also the potential to obtain statistically larger samples of specimens via screenwashing of bulk matrix samples.

The Project has the potential to produce additional significant paleontological resources should construction impacts encounter Pleistocene-aged sediments beneath the younger or disturbed surficial sediments in this area. Significant paleontological resources are fossils and fossiliferous deposits, here defined as consisting of identifiable vertebrate fossils, large or small, uncommon invertebrate, plant, and trace fossils, and other data that provide taphonomic, taxonomic, phylogenetic, paleoecologic, stratigraphic, and/or biochronologic information.

The recovery of fossils from Project excavations as the result of paleontological monitoring, together with the implementation of the procedures outlined in this report, would add to existing paleontological data and help better document the Pleistocene history of California. The recovered fossils would provide information that may be useful in more accurately and precisely determining the ages of the sedimentary units in which they were preserved depending upon the biostratigraphic utility of the fossil specimens and potential for radiocarbon dating, and provide a new Pleistocene age fossil locality data point for this portion of southern California. Depending upon the types of fossils that are recovered from Project excavations and the quality of their preservation, the existing Pleistocene fossil record of California may be enhanced by the addition of new specimens of known taxa, the discovery of taxa that have not been previously reported from the general area, and possibly the discovery of previously unknown taxa. In combination, the fossil assemblage from the Project area would have the potential to add new paleoecologic and paleoenvironmental information to our existing knowledge of the Pleistocene in Orange County.

All scientifically significant fossils salvaged from the Project area will be permanently curated in an accredited regional museum where they will be available for future scientific research. The County of Orange requires consultation before the final determination of a paleontological repository is made.

9.0 IMPACTS TO PALEONTOLOGICAL RESOURCES

Surface disturbing actions in areas known to contain scientifically significant fossils (sedimentary geologic formations) may produce adverse impacts to nonrenewable paleontological resources (State CEQA Guidelines, 14 CCR Sections 15064.5[3] and 15023; State CEQA Guidelines Appendix G, Section V, Part C).

Direct impacts to paleontological resources concern the physical destruction of fossils, usually by human-caused ground disturbance. Indirect impacts to paleontological resources typically concern the loss of resources to theft and vandalism resulting from increased public access to paleontologically sensitive areas. Cumulative impacts to paleontological resources concern the incremental loss of these nonrenewable resources to society as a whole.

Project activities not related to earthmoving are not expected to have a paleontological impact, because the surface of the Project area has been surveyed and determined to be barren of fossils.

During the field survey, no fossils were observed in the surface exposures of disturbed alluvium within the Project area boundaries. A paleontological records search for the property was performed by Dr. Samuel McLeod, at the LACM. There are no documented paleontological localities within the boundaries of, nor within one mile radius of the Project area (McLeod, 2013) (Appendix A). Geologic units mapped at the surface beneath the Orange Coast College campus have a high paleontological sensitivity with respect to their potential to yield fossil remains (Appendix B).

The old paralic deposits within the Project area are unlikely to yield fossils, and are considered to have a high potential to contain significant nonrenewable fossil resources (McLeod, 2013; Appendix A). However, these Pleistocene age deposits underlie the surficial alluvial fan deposits within the Orange Coast College campus, and have a high paleontological sensitivity (McLeod, 2013) (Appendix A).

It is anticipated that construction activities that extend less than five feet below the ground surface would only impact artificial fill, topsoil, and/or the surface mapped younger Holocene age deposits mapped within the Project area. Although this is an arbitrary metric, five feet is the typical interval utilized in construction operations (e.g., mass grading, trenching, and drilling), and is a best guess for avoiding monitoring of Holocene sediments. If fossils are unearthed during construction at a shallower depth than five feet, the monitoring program should be adjusted accordingly. As evidenced by nearby LACM fossil collection localities (McLeod, 2013), it is possible that older, Pleistocene age deposits may occur at depths below five feet within the Project area.

10.0 MITIGATION MEASURES

The Project area is comprised of alluvial fan deposits, overlying Pleistocene age old paralic deposits at depth (Morton and Miller, 2006). The paleontological sensitivity of the Pleistocene age old alluvial deposits is high and the discovery of at least some "unique paleontological resources" (CEQA Guidelines) during construction excavation is likely.

A paleontological mitigation program to mitigate adverse impacts to significant paleontologic resources is recommended for the proposed Project (McLeod, 2013) (Appendix A). Excavations into undisturbed Pleistocene age deposits may unearth scientifically significant fossils at an indeterminate depth below the alluvial fan deposits during construction. Such disturbance should be monitored during construction in order to mitigate adverse impacts to scientifically significant paleontological resources (McLeod, 2013) (Appendix A).

If any subsurface fossils are found by construction personnel, activity in the immediate area should be suspended and the fossils should be left in place untouched. A qualified paleontologist should then evaluate the significance of the discovery and make further recommendations. Fossils that are considered unique under CEQA guidelines, Section V(c) of Appendix G (CEQA; PRC §21000, et seq.) should be collected, prepared, analyzed, reported, and curated.

According to the Society of Vertebrate Paleontology (2010):

> *"A Significant Fossiliferous Deposit is a rock unit or formation which contains significant nonrenewable paleontologic resources, here defined as comprising one or more identifiable vertebrate fossils, large or small, and any associated invertebrate and plant fossils, traces and other data that provide taphonomic, taxonomic, phylogenetic, ecologic, and stratigraphic information."*

In the unlikely event that earthmoving activities extend into a significant fossiliferous deposit, paleontological monitoring (e.g. field observation by a qualified paleontological technician) will be warranted. If development does impact these sediments, examination of the sediments by the Project paleontologist would be needed to ascertain paleontological sensitivity.

10.1 Procedures

The following procedures and staffing requirements shall be implemented to ensure compliance with these requirements.

APM-1 Retention of a qualified paleontologist

Procedures: Paleo Solutions has been retained to design and implement this document. An Orange County Qualified Paleontologist must be retained by the Project owner to implement the mitigation measures discussed below.

APM-2 Preconstruction meeting

Procedures: An Orange County Qualified Paleontologist (principal investigator) shall participate in a preconstruction meeting with Project construction personnel in order to ensure an understanding of any mitigation measures required during construction and procedures to follow in the event of a fossil discovery.

APM-3 Paleontological monitoring in areas of high geologic sensitivity

Procedures: Paleontological resource monitoring of construction excavations involves field inspections of freshly graded surfaces, spoils piles, and all visible temporary surfaces in accordance with project safety requirements for occurrences of exposed fossil remains. During construction excavation activities, the monitoring schedule and specific locations that can be inspected are dictated by field conditions including the number and locations of heavy equipment in the cut and amount of excavation activity. The primary responsibility of paleontological monitors should always be to adhere to all Project safety requirements, and to only inspect and evaluate fossil discoveries when conditions are safe to do so.

Paleontological monitoring of earthmoving activities below five feet (an arbitrary depth below which Holocene age sediments are anticipated) will be conducted on an as-needed basis by the paleontological monitors under the supervision of an Orange County Qualified Paleontologist (principal investigator) during all earthmoving activities that may expose sensitive strata. If fossils are unearthed at a shallower depth, the monitoring program should be adjusted accordingly. Earthmoving activities in areas of the Project area where previously undisturbed strata will be buried but not otherwise disturbed will not be monitored. The Principal Investigator or his/her assignee will have the authority to reduce monitoring once he/she determines the probability of unearthing fossils is lower than anticipated. If the excavations in undisturbed sediments will exceed five feet in depth, a qualified paleontological monitor should be present to observe earthmoving activities in these areas. Five feet is the general dividing point in this area after which monitoring should be initiated in sediments of high sensitivity, as determined by mapping, and in compliance with County of Orange guidelines. In areas of disturbed sediments on campus, a paleontological monitor should spot-check construction activities until such a time that it becomes possible to determine the depth of undisturbed native sediments or that no undisturbed sediments have been or will be impacted. Monitoring during any brushing or vegetation removal activities in artificial fill is not recommended.

APM-4 Paleontological discoveries

If a fossil is discovered by a monitor during construction, the monitor must immediately notify the equipment operator and the construction manager to stop work, and then delineate the discovery area with flagging until it can be fully explored and evaluated. The paleontological monitor shall immediately notify the construction manager and the Principal Investigator. Construction activities in the immediate vicinity of the Project area shall be immediately redirected away from the vicinity of the discovery to allow room for the recovery of the resources as necessary. Earthmoving will be allowed to proceed within the discovery site when the principal investigator determines the fossil discovery has been adequately documented and recovered.

APM-5 Post construction

All scientifically significant fossils collected during monitoring and salvage should be cleaned, repaired, sorted, and cataloged as part of the mitigation program. Prepared fossils, along with copies of all pertinent field notes, photos, and maps, should be reposited (as a donation) at the John D. Cooper Archaeological and Paleontological Center at California State University, Fullerton. Donation of the fossils should be accompanied by financial support for initial specimen storage. A final summary report should be completed that outlines the results of the mitigation program. This report should include discussions of the methods used, stratigraphic section(s) exposed, fossils collected, and significance of recovered fossils.

Attn: Geraldine Aron, President

re: Paleontological resources for the proposed Orange Coast College Project, in the City of Costa Mesa, Orange County, project area

Dear Geraldine:

I have conducted a thorough search of our paleontology collection records for the locality and specimen data for the proposed Orange Coast College Project, in the City of Costa Mesa, Orange County, project area as outlined on the portion of the Newport Beach USGS topographic quadrangle map that you sent to me via e-mail on 4 September 2013. We have no vertebrate fossil localities that lie directly within the outline boundaries of the proposed project area, but we do have localities nearby from sedimentary deposits similar to those that occur at depth in the proposed project area.

According to the geologic mapping, in the entire proposed project area there are surface exposures of marine younger Quaternary Terrace deposits, although our vertebrate fossil localities in this area almost always contain terrestrial fossil vertebrates. These deposits typically do not contain significant vertebrate fossils, at least in the uppermost layers, but they are usually underlain by older Quaternary deposits that frequently do contain significant vertebrate fossils. Our closest vertebrate fossil locality from these deposits is LACM 1339, directly west of the proposed project area along Adams Avenue near the top of the mesa bluffs east of the Santa Ana River. Fossil mammoth, *Mammuthus*, and camel, Camelidae, bones were recovered from LACM 1339 in sand approximately 15 feet below the top of the mesa that is overlain by shell bearing silts and sands. Our next closest vertebrate fossil locality is LACM 4219, south of the eastern-most portion of the proposed project area in a roadcut for the Newport Freeway near Santa Isabel Avenue, that produced fossil sea turtle, Cheloniidae, and camel, Camelidae, bones in coarse poorly sorted friable sands about 30 feet below the grade of Newport Boulevard. We further have a large number of localities from the marine and terrestrial Late Pleistocene terraces deposits on the east side of Upper Newport Bay. Those localities have produced an extensive composite fauna.

Surface grading or very shallow excavations in the nominally marine younger Quaternary Alluvium exposed in the entire proposed project area probably will not uncover significant vertebrate fossil remains. Deeper excavations that extend down into older Quaternary deposits, however, may well encounter significant fossil vertebrate specimens. Any substantial excavations in the proposed project area, therefore, should be monitored closely to quickly and professionally recover any fossil remains discovered while not impeding development. Any fossils recovered during mitigation should be deposited in an accredited and permanent scientific institution for the benefit of current and future generations.

This records search covers only the vertebrate paleontology records of the Natural History Museum of Los Angeles County. It is not intended to be a thorough paleontological survey of the proposed project area covering other institutional records, a literature survey, or any potential on-site survey.

Sincerely,

Samuel A. McLeod

Samuel A. McLeod, Ph.D.
Vertebrate Paleontology

Appendix B: Statement of Qualifications

PROJECT MANAGER / PRINCIPAL INVESTIGATOR (PALEONTOLOGY)
Sarah A. Siren, M.S.

Education: M.S., Vertebrate Paleontology, South Dakota School of Mines & Technology
B.S., Geology, The George Washington University

Ms. Siren has been a paleontological resources consultant for over a decade. She has served as paleontologist for numerous projects throughout California, with extensive experience in Imperial, Orange, Riverside, Los Angeles, San Bernardino, and San Diego counties. These projects involved multiple agencies, public and private sector clients, a variety of resources, and multidisciplinary staff supervision. She specializes in CEQA and BLM compliance standards. She has taught at Saddleback Community College in Mission Viejo, California as an associate geology professor and has worked as a curatorial assistant with the Natural History Museum of Los Angeles County, and more recently, as field manager with the San Diego Natural History Museum. Ms. Siren received a Bachelor of Science Degree in Geology (1999) from The George Washington University and was awarded a Master's Degree in Paleontology (2002) from the South Dakota School of Mines and Technology. While pursuing her degrees, she conducted studies at both the Smithsonian Institution and Badlands National Park, and supervised as lead research scientist for various field activities, curation projects, and laboratory preparations. Her diverse experience includes recovering, identifying, mapping, and preparing fossils. As a consultant, Ms. Siren is able to effectively manage projects and complete deliverables from assessments to final technical reports in a timely manner. She is a Geologist-in-Training (no.167) with the State of California and is 40 hour HAZWOPER certified.

PRESIDENT
Geraldine L. Aron

Education: M.S., Geological Sciences, California State University, Long Beach
B.S., Geological Sciences, California State University, Long Beach

Ms. Aron has fifteen years of professional experience working in the Paleontological and Cultural Resource Management field and is responsible for maintaining the overall scientific integrity and oversight of all Paleo Solutions, Inc. projects. This includes all aspects of company management, field paleontology and geology including: survey, salvage, measuring and drafting stratigraphic sections, geological mapping, sample collection, and paleontological and archaeological monitoring, budget oversight, managing, training, and coordinating the tasks of field staff, developing cliental relationships, fossil preparation, and the production of technical reports. Ms. Aron has produced hundreds of technical reports, which include paleontological assessments, DEIR’s, EIR/EIS’, Paleontological Mitigation and Monitoring Plans, document reviews, and survey reports for CEQA/NEPA compliance. Geraldine has worked on at least half a dozen-water projects in and around the greater Los Angeles area and more than a dozen transmission line projects. Her field projects, both geological and paleontological, include areas in Utah, central and eastern Nevada, southern, eastern, central, and northern California counties, including Owens Valley and surrounding areas. Her career also included an appointment as a staff paleontologist at the San Diego Natural History Museum, where she gained valuable experience both in the field and in specimen preparation. Geraldine is certified by the California Energy Commission (CEC) to conduct paleontological monitoring and teach environmental awareness programs and is the Principal Investigator on the California, Nevada, and Arizona BLM permits.

PAGE INTENTIONALLY LEFT BLANK

INTRODUCTION

PAGE INTENTIONALLY LEFT BLANK

INTRODUCTION

This Historic Structures Report (HSR) for Orange Coast College (OCC or the college) was prepared by Page & Turnbull for the Coast Community College District (CCCD) under Purchase Order PO336635. The campus is located at 2701 Fairview Road in Costa Mesa, California.

A Historic Structures Report (HSR) is generally considered a primary planning document for the stewardship of historic buildings and sites. HSRs are frequently the only place where a site's past history is compiled; its present appearance and physical condition are recorded; and its future treatment is planned. HSRs typically follow a prescribed format[1], which this report follows for Orange Coast College. While the organization of HSRs may be similar, each report has a focus to address critical issues. The HSR for OCC is rather unusual for two reasons. First is its scale, as it encompasses a historic district rather than an individual building or structure. The historic district has been determined eligible for listing in the National Register of Historic Places (National Register) and the California Register of Historical Resources (California Register). Second, most of the contributing elements of the historic district are proposed to be demolished as part of the CCCD's Vision 2020 Facilities Master Plan for Orange Coast College. This HSR focuses on providing preservation alternatives to prevent demolition of the contributing elements of the eligible historic district.

This HSR concentrates on four of OCC's original building complexes (12 buildings total), as well as a stadium, field house and pool complex. The buildings were constructed between 1950 and 1957 as part of the campus's initial seven-year development under the original master plan, which was developed in 1948-9 by master architect and planner Robert E. Alexander in association with master landscape architect Garrett Eckbo. Master architect Richard Neutra merged practices with Alexander in 1949 and OCC buildings from 1953 to 1957 were designed by Neutra and Alexander.

Individual sections of the HSR discuss the overall OCC Historic District as identified by Page & Turnbull followed by each district contributor organized in complexes. The complexes within the core of the Historic District are presented first and arranged in chronological order by date of completion. The order is:

- Buildings 7[2], 8, 9 | Student Success Center and Classroom & Labs complex (1951/1955)
- Buildings 12, 13, 14 | Business Education complex (1953)
- Building 2, 3, 4 | Theater and Music complex (1955)
- Buildings 35, 36, 37, 38, 39 | Math and Planetarium complex (1956-1957)
- Building 93 | Swimming Pool complex (1954)
- Building 105 & 110 | Stadium and Field House (1955)

[1] Refer to US Department of the Interior, National Park Service publication: *Preservation Brief 43: The Preparation and Use of Historic Structure Reports.*

[2] Note: The building numbers used throughout the HSR are those currently used by OCC on their campus maps and plans. The draft EIR uses a different building numbering system.

OBJECTIVES OF THE HISTORIC STRUCTURES REPORT

The objectives of the Orange Coast College Historic Structures Report are to:

- Confirm the findings of a previously prepared Historic Resource Tech Report (HRTR) regarding the historic status eligibility of a historic district at OCC and the definition of its contributing elements.
- Identify character-defining features of the eligible historic district, including landscape and site features and individually eligible buildings.
- Assess the current physical condition of contributing buildings and features
- Define one or more "Preservation Alternatives" for the contributing buildings to the eligible historic district. The maximum alternative would retain all of the buildings and rehabilitate them in conformance with the *Secretary of the Interior's Standards for the Rehabilitation of Historic Properties (the Standards)*. The minimum alternative would retain just enough contributing buildings and character-defining features to retain an eligible historic district following selective demolition and adaptive use. Developing the alternatives includes:
  - Identifying possible future uses for contributing buildings
  - Determining code requirements for potential uses
  - Establishing construction work and associated costs required to adaptively re-use the contributing buildings
  - Providing treatment recommendations
- The preservation alternatives will be used to support finalization of the environmental review process.

STUDY SUMMARY

Critical Findings

Historic Significance Evaluation

Page & Turnbull found a discontiguous historic district that is eligible for listing in the National Register of Historic Places and the California Register of Historical Resources. The eligible OCC Historic District (the Historic District) is significant under Criterion A/1 in the context of education in California for its direct association with the postwar expansion of higher education through the local development of junior colleges. It also meets Criterion C/3 as an excellent example of a Mid-Century Modern junior college campus and is also significant as a work by master architects Neutra and Alexander in collaboration with landscape architect Garrett Eckbo.

The Historic District includes the following building complexes:

- Student Success Center and Classroom & Labs complex (Buildings 7, 8, 9)
- Business Education complex (Buildings 12, 13, 14)
- Theater and Music complex (Buildings 2, 4)
- Math and Planetarium complex (Buildings 35, 36, 37, 38, 39)
- Swimming Pool complex (Building 93), discontiguous
- Stadium and Field House (Buildings 105 & 110), discontiguous

District Contributors

District Non-contributors

Identified Historic District Boundaries

This map illustrates the Orange Coast College Historic District, including both contributors and non-contributors, identified by Page & Turnbull.

** Student Center (Building 86) was designed by Neutra and Alexander in 1952, but was substantially altered ca.1992.*

A contributing object, the armillary sphere sculpture, and contributing landscape features are part of the Historic District. The prominent clock tower is also a character-defining feature of the Historic District, but is attached to the Student Success Center (Bldg. 7) and considered part of that building.

The eligible Historic District has a period of significance from 1950, with the construction of OCC's first permanent building, through 1957 when the final Neutra and Alexander-designed building was completed. The end date also corresponds to the end of the seven-year limited local tax that funded the initial campus development.

The Robert B. Moore Theater, a contributor to the Historic District, was identified as individually eligible for the California Register of Historical Resources in the HRTR. Page & Turnbull agrees with this assessment, given the significance conveyed by the building under Criterion 3 for its high architectural design and association with master architects: Richard Neutra and Robert E. Alexander.

The eligible Historic District identified by Page & Turnbull has a shorter period of significance, smaller boundaries, and fewer contributors than the historic district identified in the HRTR. See Evaluation of Significance section for more details.

Immediate Life-Safety Issues

The structural engineer evaluated all contributing buildings located within the Historic District boundary and identified two locations of deteriorated wood structural members that present a risk of localized failure if not stabilized. The areas are:

- Building 9 – South elevation covered walkway support beam below a mechanical unit exhibits major deterioration.
- Building 13 – Cantilevered wood outriggers at the north side of the breezeway exhibit major damage and deterioration.

This information was transmitted to the Coast Community College District on January 22, 2015. More detail regarding these items is included in the Structural Evaluation (Appendix 3) of this report.

Building Condition

Given their age, the buildings included in our assessment are generally in fair-to-good condition. Major issues include:

- **Structural Mitigation**: Most of the buildings require enhanced structural connections between the roof and walls to provide additional seismic resilience.
- **Inappropriate Heating, Ventilating, and Air Conditioning (HVAC) Installations**: At the three central complexes, mechanical equipment and ductwork was installed on top of the covered walkway canopies. Not only are these installations of extreme detriment to the buildings' aesthetics, but the installations typically do not have adequate structural support nor provide for adequate drainage.

- **Hazardous Materials Abatement**: Review of previous hazardous materials testing and records for the District revealed that only limited testing for asbestos has been performed on the buildings eligible for historic designation. Per our scope of services, our team performed a visual assessment to identify areas potentially containing hazardous materials, such as lead, mercury, and PCBs. These observations will need to be confirmed via laboratory analysis. All cost estimates prepared for this report include allowances for abatement.
- **Concrete Repair at Stadium**: A high degree of concrete deterioration was observed at the stadium bleachers. The spalling of concrete bleacher risers appears to be due to the corrosion (rusting) of steel reinforcing within the concrete risers.
- **Face Spalling / Efflorescence at Brick Units**: Brick units used on several of the buildings eligible for historic designation exhibit an unusually high degree of deterioration. Specifically, spalling of the face of individual brick units and efflorescence (salt build-up) at areas under the spalled surfaces. Laboratory testing will be required to determine the exact cause of the problem, but initial observations indicate problems with the original brick manufacture and/or rising damp due to irrigation in adjacent plantings. While not currently a structural issue, the deterioration is aesthetically displeasing and presents long-term maintenance challenges. Note that the bricks are an unusual size.

Preservation Alternatives

Several preservation alternatives are provided within the Part 2 Treatments and Appendix 2 of this HSR. The alternatives represent a range, from a *Standards* compliant option that adaptively reuses all buildings slated for demolition within the eligible Historic District in the Vision 2020 Facilities Master Plan (Preservation Alternative 1A), to an alternative that allows for some demolition, but still maintains the Historic District (Preservation Alternatives 2A and 2B). Alternative uses for the adaptively reused buildings were generated through meetings with OCC and CCCD administration and staff, discussion with other OCC planning and programing consultants, and review of the Vision 2020 Facilities Master Plan and draft EIR. While a range of reuse options are presented in the Preservation Alternatives, not all possible configurations and programmatic scenarios are included. The historic buildings provide sufficient flexibility where additional options to re-program the buildings are possible. Estimated costs included in the Preservation Alternatives reflect Page & Turnbull's scope of work only and do not include related work as defined by the CCCD.

New Planetarium Location

One of the major factors shaping the alternatives is a proposed new planetarium for the College. The new Planetarium is proposed for the site of the existing Math Wing and Planetarium complex including the original Planetarium (Buildings 35, 36, 37 and 39). The CCCD has reported that this Project has cleared building permit review by the California Division of the State Architect (DSA) and is "shovel ready" with construction scheduled to start late-summer / early-fall 2015. Preservation Alternatives 1A through 1C relocate the proposed new Planetarium approximately 200-feet to the northeast of the existing Math Wing and Planetarium complex. A portion of the Math Wing and Planetarium complex is adapted to provide additional support and amenities to the new Planetarium. Alternatives 2A and 2B, retain the plan east Math Wing (Bldg. 35) and allow for the new Planetarium to be built in its preferred location. As described in the HSR, it is our professional opinion that retention of Building 35 is critical to retaining the character of the eligible Historic District and relationship of the central core buildings.

Preservation Alternative 1A

Preservation Alternative 1A retains all of the contributors to the eligible Historic District and can be considered the maximum reuse alternative. The new Planetarium is relocated to outside the Historic District's north boundary to avoid demolishing contributing buildings. Buildings north of the Historic District may be demolished to allow for the relocated new Planetarium and to connect the Historic District to new classroom buildings currently under construction. Within the Historic District, non-contributing buildings and additions made after 1957 will be removed to restore the original site planning principles of the Historic District, including an east-west axis that has been disrupted by non-contributors. The historic buildings will be rehabilitated in conformance with the *Secretary of the Interior's Standards for Rehabilitation* (*Standards*). The original classroom buildings will be adaptively reused for Administrative Services, Special Services and the Honors Program, and as an interdisciplinary center shared by the Science, Architecture, and Art Departments as well as student and community facilities. The Theater and Music complex buildings (Bldgs. 2 and 4) will retain their current use. Where required by code, structural systems will be sensitively retrofitted to increase seismic performance. New heating, ventilation and air conditioning (HVAC) systems are proposed and will be installed in a manner that is compatible with the buildings. Interiors will receive new finishes and contemporary power, lighting and audio-visual equipment is included. Minor and sensitive alterations to character-defining features, such as introducing skylights at the covered walkways to allow better visibility around the buildings, are proposed. The estimated cost for Alternative 1A is approximately $30 million.

Figure 1: Birds-eye view looking southwest of Preservation Alternative 1A. The revised location of the new proposed Planetarium and adaptively reused Math Wing and Planetarium complex is to the upper right.[3]

Preservation Alternative 1B

Alterative 1B is the same as Alternative 1A, except the Swimming Pool complex (Bldg. 93) and Field House (Bldg. 110) are removed to allow the College to focus its resources on preserving the core of the Historic District. Although this alternative does not fully comply with the *Standards*, the loss of the discontiguous Swimming Pool complex (Bldg. 93) does not affect the Historic District's ability to convey its significance to the extent that it is no longer eligible for historic listing. The Stadium (Bldg. 105) remains as an eligible component of the Historic District, even without the Field House (Bldg. 110). The estimated cost for Alternative 1B is approximately $25 million.

Preservation Alternative 1C

In response to comments from the College Administration, Alternative 1C retains the Special Services Building (Bldg. 10) as well as non-contributing additions at Building 7. The rest of the alternative is similar to Alternative 1B. With Special Services remaining in Building 10, part of Building 7 is adaptively reused as a theater pre-function space. Alternative 1C will not restore the east-west axis that was a key part of the original circulation pattern in the Historic District, but the District will retain its eligibility for historic listing. The estimated cost for Alternative 1C is approximately $26 million.

[3] All images Page & Turnbull, 2014 – 2015, unless identified otherwise.

Figure 2: Campus "quadrangle" looking east at a rehabilitated Building 14. This outdoor space would be directly adjacent the new proposed Planetarium in its alternative location.

Preservation Alternative 2A

Preservation Alternative 2A is considered a minimum preservation alternative, where the new Planetarium remains at its proposed location and contributing buildings at the Math Wing and Planetarium complex, Buildings 36, 37, and 39, are removed. The east Math Wing (Bldg. 35) remains to continue, in a more limited manner, the spatial relationship among the original classroom complexes. While not preferred, it is in Page & Turnbull's opinion that an eligible historic district remains because sufficient buildings would exist at the core of the Historic District to convey the significant spatial relationships from the original planning and design. However, removal of any additional historic fabric beyond what has been identified in Preservation Alternative 2A would jeopardize the eligibility of the Historic District for historic listing.

Under Alternative 2A, the remainder of the Historic District will be rehabilitated with particular emphasis on preserving and restoring original character-defining features so that the District is able to better convey its significance. Non-contributing buildings and additions made after 1957 within the Historic District will be removed to restore the spatial relationships between classroom building complexes as well as an east-west axis that has been disrupted by non-contributors. The Swimming Pool complex (Bldg. 93) and Field House (Bldg. 110) will be removed, as under Alternative 1B. The remaining historic buildings will be rehabilitated in conformance with the

Standards. Reuses for the classroom buildings are similar to Alternative 1A. Overall, Alternative 2A includes less square footage due to the loss of Buildings 36 and 37. The existing Planetarium (Bldg. 39) will be relocated to a to-be-determined location outside of the Historic District. The Theater and Music complex buildings (Bldgs. 2 and 4) will retain their current use.

Where required by code, structural systems will be sensitively retrofitted to increase seismic performance. New heating, ventilation and air conditioning (HVAC) systems are proposed and will be installed in a manner that is compatible with the buildings. Interiors will receive new finishes and contemporary power, lighting and audio-visual equipment is included. Minor and sensitive alterations to character-defining features, such as introducing skylights at the covered walkways to allow better visibility around the buildings, are proposed. The estimated cost for Alternative 2A is approximately $23 million.

Preservation Alternative 2B

In response to the College Administration who indicated a desire for a new building for their Dance Department, Alternative 2B includes an addition to Building 7 to accommodate Dance Studios. The addition shall be located and designed to be compatible with Building 7 and will not impact the integrity of the Historic District. The rest of Alternative 2B is similar to Alternative 2A. The estimated cost for Alternative 2B is approximately $30 million.

Methodology

Page & Turnbull and its sub-consultants produced this HSR between December 2014 and April 2015. The team's work was broken into five tasks:

Task 1A | Collect and Review Existing Information

In conjunction with Orange Coast College, Page & Turnbull acquired and reviewed the following documents for buildings identified as eligible for historic designation:

- Available original architectural drawings in digital format
- Available architectural drawings of subsequent alternations in digital format
- Limited architectural drawings, specifications and construction administration reports present in the Department of State Architect (DSA) archives (from the San Diego service center)
- Available hazardous materials surveys
- Facilities Utilization, Space Inventory Options Net "FUSION" database reports maintained by the Foundation for California Community Colleges.
- Miscellaneous Autocad drawing files

The documents noted above were distributed to our consultant team.

We also downloaded publically available documents such as the Vision 2020 Facilities Master Plan and draft EIR.

Page & Turnbull acquired existing research from Ostashay & Associates used to prepare the HRTR.

Task 1B | Draft Development History and Review Previous Evaluation

Page & Turnbull peer reviewed the HRTR and identified additional areas of research for drafting the development history and historic context. Supplemental research was conducted at the;

- Orange Coast College Archives at the OCC Library;
- Garrett Eckbo Collection in the Environmental Design Archives at the University of California, Berkeley;
- Robert E. Alexander Collection in the Division of Rare and Manuscript Collection at Cornell University Library; and the
- Julius Shulman Photography Archive at the Getty Research Institute.

Limited additional research was conducted at the Los Angeles Public Library, the University of Southern California Fine Arts Library, and various online resources.

Page & Turnbull also conducted site visits in December 2014 to gather information for building descriptions, identify primary character-defining features, and review historic integrity. Digital photographs were taken during the visits. Page & Turnbull used the information gathered in Task 1A and Task 1B to re-evaluate the OCC Historic District's historic significance, integrity, period of significance, district boundaries, and list of contributors and non-contributors. Page & Turnbull reviewed the results with the CCCD Board of Trustees, CCCD administration and OCC administration in February 2015.

Task 1C | Conditions Assessment

Page & Turnbull's project team, including consultants, conducted visual inspections of the Historic District's contributing buildings the week of January 12, 2015. The purpose of the inspections were to document existing conditions; this included exterior envelopes, structural, mechanical, electrical and plumbing (MEP), and fire and life-safety systems. In addition, a visual survey of potentially hazardous materials was completed. Conditions were recorded through hand-written field notes, sketches, and digital photography. Page & Turnbull reviewed the results with the CCCD Board of Trustees, CCCD administration, and OCC administration in March 2015.

Task 2A | Preservation Objectives & Work

Page & Turnbull discussed potential programmatic elements with the College's senior administrative staff in a series of meetings in February and March 2015. Page & Turnbull also attended a Facilities Committee Meeting in March 2015 and received additional program information from Hill Partnership Inc. and Brailsford & Dunlavey about the College's future space needs and desires to inform our development of preservation alternatives.

Task 2B | Work Recommendations & Alternatives

Page & Turnbull reviewed our preliminary preservation alternatives and treatment recommendations with the CCCD Board of Trustees, CCCD staff, and OCC staff in March 2015.

Project Data

Site:	Orange Coast College
Location:	2701 Fairview Road, Costa Mesa, CA - 92626
Architect:	Richard Neutra and Robert E. Alexander in collaboration with landscape architect Garrett Eckbo
Construction Date:	Constructed circa 1950-1957 Alterations 1958-Present
Current Use:	Community College
Acreage:	164 Acres (current)
No. of Buildings:	78 (current)
Enrollment:	22,053 (Fall 2014)

PROJECT BACKGROUND

The need for this Historic Structures Report (HSR) grew out of the Orange Coast College's Facilities Master Plan update and the subsequent environmental review that identified an adverse environmental impact created by the proposed demolition of buildings determined eligible for listing in the California Register.

Vision 2020 Facilities Master Plan

The *Vision 2020 Facilities Master Plan* (Plan) was published by the Coast Community College District (CCCD) in May 2011. The intent of the Plan was to provide a current perspective for future space requirements, buildings and campus improvements for the CCCD's three campuses, including Orange Coast College (OCC or College). Included in the "Foundation for the Future Vision" Section of the Plan were the following "Key Planning Assumptions"[4] for OCC, which were generated from surveys with the faculty, staff, students and administrators:

- Campus zoning will be a priority in the facility plan of the future.
- Future site development will seek to unify the campus.
- Aesthetics are viewed as important in defining/reflecting the College's identity
- The creation and maintenance of open space and planned landscaping is a priority for campus development
- Sustainability is an important element in the future planning/development of the campus
- New buildings on the campus will be timeless with respect to architectural design
- The internal plan of the College will seek to resolve conflicts that exist between service vehicles, bicycles, skate boards, and pedestrians
- The College will seek to engage in public/private relationships that are revenue generating in nature
- Joint venture partnerships that result in synergistic developments will be actively pursued.

The Plan calls for the "the vast majority of older 1950's campus facilities (row buildings) [to be] replaced with larger, more efficient structures."[5] The larger structures are shown to be at the perimeter of the campus core, creating a very large central open space. Proposed demolition includes three of four of the building complexes (10 buildings total) and the Swimming Pool complex that dated to the College's initial construction period financed by a limited local tax (1950 – 1957). During the environmental review process, these buildings were determined to be eligible for listing in the California Register as part of a historic district.

---

[4] Coast Community College District – Vision 2020 Facilities Master Plan, prepared by Cambridge West Partnership, LLC and HPI Architects, dated May 2011, page 37

[5] Vision 2020, page 92

Figure 3: Above: Aerial rendering looking northeast from the Vision 2020 Facilities Master Plan which proposes demolition of three of the four remaining original OCC building complexes in order to create a very large central open space. Source: Vision 2020 Facilities Master Plan page 113. Below: Aerial photograph looking northeast from 1957 showing the first phase of campus development. Source: Orange Coast College Library. Red dot indicates location of the Robert J. Moore Theater.

The Plan indicates the scheduled construction of a new Business / Math / Computer Center and a Language Arts / Social Sciences Building. Proposed future construction at OCC included:

- A Recycling Center
- Parking Structure / Campus Security
- Student Union / Bookstore / Culinary Arts / Student Success Center
- Planetarium
- Administration Building
- Joint Venture / Mixed Use Development

Measure M Funding

Much of the Coast Community College District and Orange Coast College improvements identified in the Vision 2020 Facilities Master Plan are to be paid through a local bond measure. Measure M was passed in November 2012 and approved $698 million in bonds to fund the expansion of courses and academic buildings in science, technology, engineering, and math (STEM). Bond funds were also allocated for upgrading technology, to construct and repair facilities, and to improve resources for active military personnel and veterans at all three CCCD campuses.

Draft Orange Coast College Vision 2020 Facilities Master Plan Program Environmental Impact Report

In June 2014, the CCCD released a Draft Orange Coast College Vision 2020 Facilities Master Plan Program Environmental Impact Report (draft EIR). Preparation of the report was required under the California Environmental Quality Act (CEQA) to "provide the public and responsible agencies information about the potential adverse effects on the local and regional environment associated with implementation of the Vision 2020 Facilities Master Plan."[6] The draft EIR identified "significant and unavoidable" environmental impacts related to the demolition of eligible historical resources.

The proposed project assessed in the draft EIR contained both program-level components, where the specific project details have not been developed, and project-level elements which have detailed information available. The proposed project included demolition of certain existing buildings, renovation of existing buildings, and construction and eventual operation of new buildings and campus facilities, which would occur over three Phases.

The assessed project included the following components.

Project-Level Demolition

Phase 1 (2015-2017)

- The Planetarium (Building 39)
- Math Wing (Buildings 35 and 36)
- George Hoag Family Foundation / Reprographic Center (Building 37)
- Adaptive PE

[6] Draft Orange Coast College Vision 2020 Facilities Master Plan Program Environmental Impact Report, prepared by Dudek, dated June 2014, page 1-1.

Phase 2 (2017-2019)

- Administration Building (Building 1)
- District Transportation Office
- Bookstore (Building 83)
- Bursar's Office (Building 149)
- Student Center (Building 86)
- Campus Public Safety (Building 147)

Phase 3 (2019-2024)

- Journalism (Building 72)
- Writer's Row (Building 71)
- Haley Business Learning Center (Building 10)
- Student Success Center (Building 7)
- Social and Behavioral Sciences (Building 80)
- 150 Annex (Building 150)
- Classrooms and Laboratories (Buildings 8 and 9)

Figure 4: An annotated aerial photograph illustrating the proposed demolition of existing buildings according to the draft EIR (Note that the building numbering differs from the campus standard). Source: Draft Orange Coast College Vision 2020 Facilities Master Plan Program Environmental Impact Report, Figure 3-6.

Project-Level Renovation

Phase 1 (2015-2017)

- Recycling Center Expansion and Circulation/Parking Improvements

Phase 3 (2019-2024)

- Skill Center
- Reuse of the existing Literature and Language Building as a College Support Center
- Remodel and expansion of the existing Chemistry Building from approximately 21,000 square feet to approximately 31,000 square feet.

Project-Level New Construction

Phase 1 (2015-2017)

- An approximately 54,050 square-foot Business, Math and Computing Center just south of LeBard Stadium. *Note that this project is currently under construction and nearing completion.*
- A four-level Parking Structure to accommodate 2,000 vehicles for both the Orange County Fairgrounds and events at the OCC campus.
- Adaptive Physical Education, Gymnasium, and Pool Facilities.
- Solar Photovoltaic Panel Carport System covering approximately 330,000 square feet.

Phase 3 (2019-2024)

- An approximately 77,600 square foot Language Arts and Social Sciences Building.

Unscheduled

- An approximately 18,000 square foot Multidisciplinary Building.

Program-Level (New Construction)

Phase 1 (2015-2017)

- An approximately 7,220 square foot Planetarium. *This project has reportedly cleared the building permitting process through the Division of the State Architect (DSA) and is considered "shovel ready"*.

Phase 2 (2017-2019)

- An approximately 24,550 square foot Administration Building.
- An approximately 72,500 square foot Student Union / Bookstore / Culinary Arts / Student Success Center.
- An approximately 299,650 square foot Student Housing Project with approximately 600 dedicated parking spaces.

Unscheduled

- An approximately 75,510 square foot Mixed-Use Development with street level retail and a boutique hotel with up to 145 rooms.

Figure 5: An annotated aerial photograph illustrating the proposed campus land uses according to the draft EIR. Source: Draft Orange Coast College Vision 2020 Facilities Master Plan Program Environmental Impact Report, Figure 3-4.

Historic Resources Technical Report

The appendices of the draft EIR contained a Historic Resources Technical Report (HRTR). The HRTR "documents and evaluates potential historic resources that may be affected by the implementation of the Orange Coast College Vision 2020 Facilities Master Plan."[7] The HRTR assessed OCC according to the CEQA guidelines and found a historic district eligible for listing in the California Register of Historical Resource under the following criteria:

- Criterion 1 for its early master planning concepts of a community college located within Orange County.
- Criterion 3 for its distinctive architectural and design qualities as interpreted in an educational facility, and
- Also Criterion 3 for its direct association with master planner and architect Robert E. Alexander; master architect Richard Neutra; landscape architect Garrett Eckbo; and Orange County architect William E. Blurock.

[7] Ostashay & Associates, "Orange Coast College Historic Resources Technical Report," in Draft Orange Coast College Vision 2020 Facilities Master Plan Program EIR, May 2014, 1.

The HRTR-identified historic district includes 23 contributing buildings (several joined in complexes), the *Armillary Sphere* art piece, and landscape features such as the main quad area, walkways, maritime flagpole, planters, mature trees, shrubs and plantings. It has a period of significance of 1948 to 1964 starting with the school's founding and encompassing the initial master planning and design by Robert E. Alexander with collaborators including landscape architect Garrett Eckbo as well as the design and planning work of Alexander's partnership with Richard Neutra. The period of significance also captures a subsequent phase of campus development with buildings designed by Pleger, Blurock, Hougan and Ellerbroek through 1964.

The HRTR finds the Robert B. Moore Theatre building is individually eligible for the California Register for its unique and distinctive architectural styling and direct association with master designers: architect Richard Neutra; landscape architect Garrett Eckbo; and acoustical engineer Dr. Vern Knudsen.

In preparing the HSR, Page & Turnbull reviewed the findings of the HRTR and concur with the HRTR's finding that a California Register-eligible historic district is present at the OCC campus. However, there is not sufficient information regarding the designers and events that shaped the subsequent phase of campus construction to support the inclusion of the 1958 to 1964 development within the identified historic district. Regardless of the size of the historic district, the proposed demolition creates a "significant and unavoidable" environmental impact.

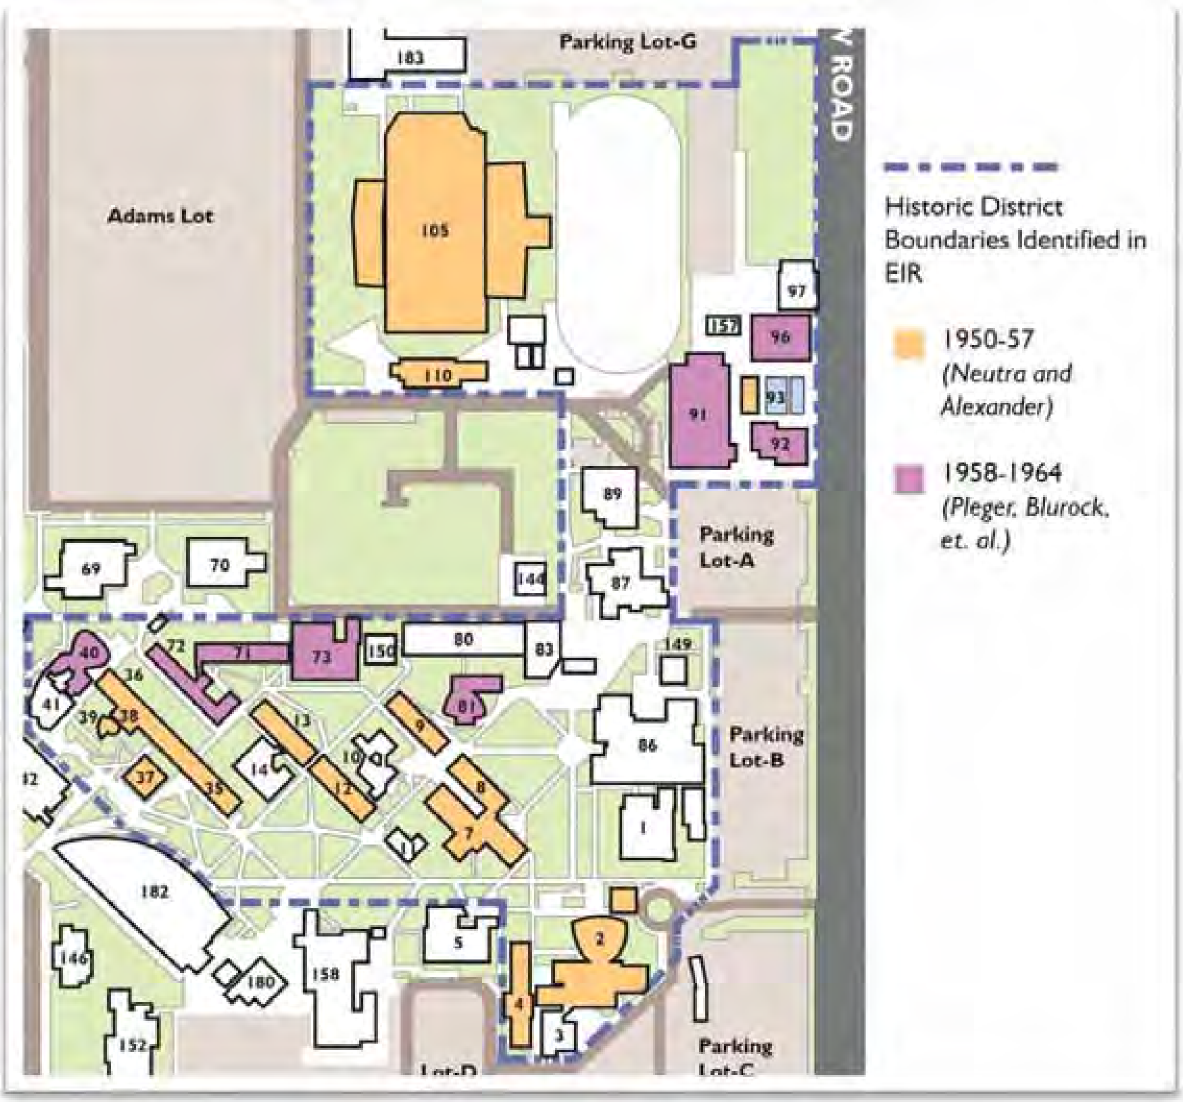

Figure 6: Partial campus plan with the dashed blue line indicating the historic district determined eligible for the California Register within the draft EIR/HRTR. The shaded buildings indicate contributors to the historic district according to the draft EIR/HRTR. As described in the Evaluation of Significance section of this HSR, after more research and analysis, Page & Turnbull believes the historic district contributors should be limited to the buildings shaded orange.

Project Alternatives

CEQA requires that the EIR "describe a range of reasonable alternatives to the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives."[8]

[8] CEQA Guidelines Section 15126(a).

Draft EIR Project Objectives[9]

The project objectives in the draft EIR are:

- Provide the building space, pursuant to the utilization and efficiency requirements established by Title 5 of the California Code of Regulations and the California Community College Chancellor's Office, to meet the Coast Community College District's (CCCD's) instructional needs and academic mission on the Orange Coast College campus.
- Update and modernize existing building spaces to meet the CCCD's instructional needs on the Orange Coast College campus.
- Accommodate growth in the student body over the planning horizon.
- Provide joint venture and entrepreneurial opportunities that generate revenue and support the academic needs and mission of the campus.
- Provide on-campus student housing.
- Foster projects that support innovative solutions to reduce resource consumption and support environmentally responsible practices to change behavior in the campus community and beyond.

The only significant and unavoidable impact in the draft EIR is the impact to historic resources with the proposed demolition of most contributors to the identified historic district. The draft EIR considered five alternatives but only three addressed the historic district: Maximum Reuse, Strategic Reuse, and Minimum Reuse. The alternatives were developed with input from the College's Facilities Planning Committee, which is comprised of professors, staff, and students. Only the Maximum Resource alternative reduced impacts to less than significant levels by retaining a California Register-eligible historic district at the College.

Maximum Reuse

From the Chapter 6 – Alternatives in the draft EIR:

> The Maximum Reuse Alternative suggests the preservation and reuse of a number of structures that contribute to the historic district in the campus core. This plan is represented by Figure 6-1, Maximum Reuse Alternative [Figure 7 here]. The plan shows that a number of contributors to the historic district (colored yellow), including the Science and Math Lecture Halls, Math Wing, Journalism, Haley Business Learning Center, Classrooms and Labs, the Forum, Robert B. Moore Theater, Music Hall and Fitness, and Stadium complex would be saved and repurposed with different uses. The plan also accommodates a new Planetarium and a new Dance Hall building (both in orange) in the central core. The new Planetarium would be moved from its proposed location and shifted south to allow the old Planetarium to be preserved in place. This new proposed location for the Planetarium creates a tight corridor between the Lewis Center for Applied Science and the library.[10]

---

[9] Draft EIR, 1-2.
[10] Direct text from draft EIR, 6-8.

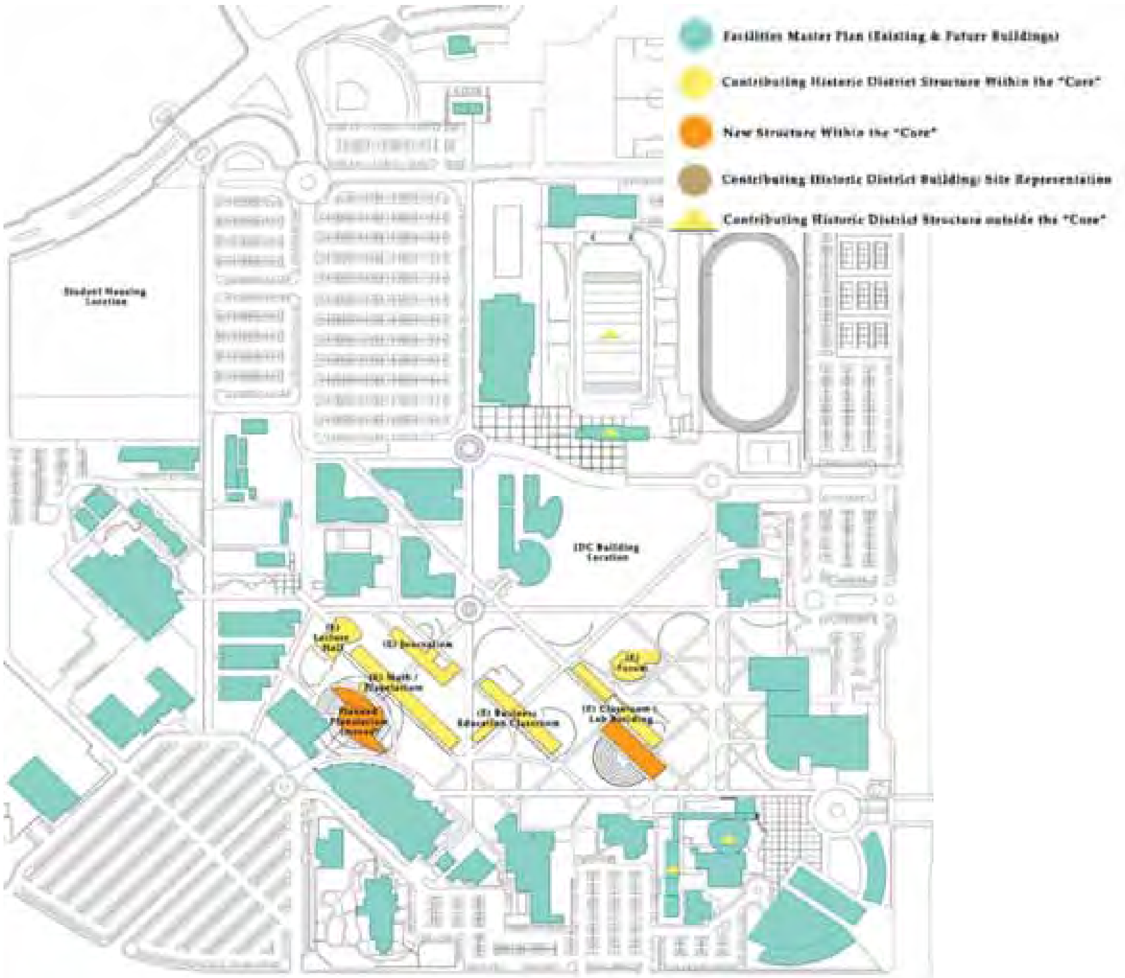

Figure 7: An illustration of the Maximum Reuse Alternative. Source: Draft Orange Coast College Vision 2020 Facilities Master Plan Program Environmental Impact Report, Figure 6-1.

Strategic Reuse

From the Chapter 6 – Alternatives in the Draft EIR:

> The Strategic Reuse Alternative as represented in Figure 6-2 [Figure 8 here], highlights the preservation and reuse of key contributing historic structures in the campus core and keeps the new Planetarium in its originally planned location. As a result, the old Planetarium would not be preserved, but the dome would be moved to serve as an entry element to the campus from the Merrimac Lot. This domed entry element could also serve as a kiosk detailing the history of the Orange Coast College campus. The plan shows that a number of contributors to the historic district (colored yellow), including the Science and Math Lecture Halls, Haley Business Learning Center, Forum, Robert B. Moore Theater, Music Hall, and Fitness and Stadium complex, would be saved.[11]

[11] Direct text from draft EIR, 6-12

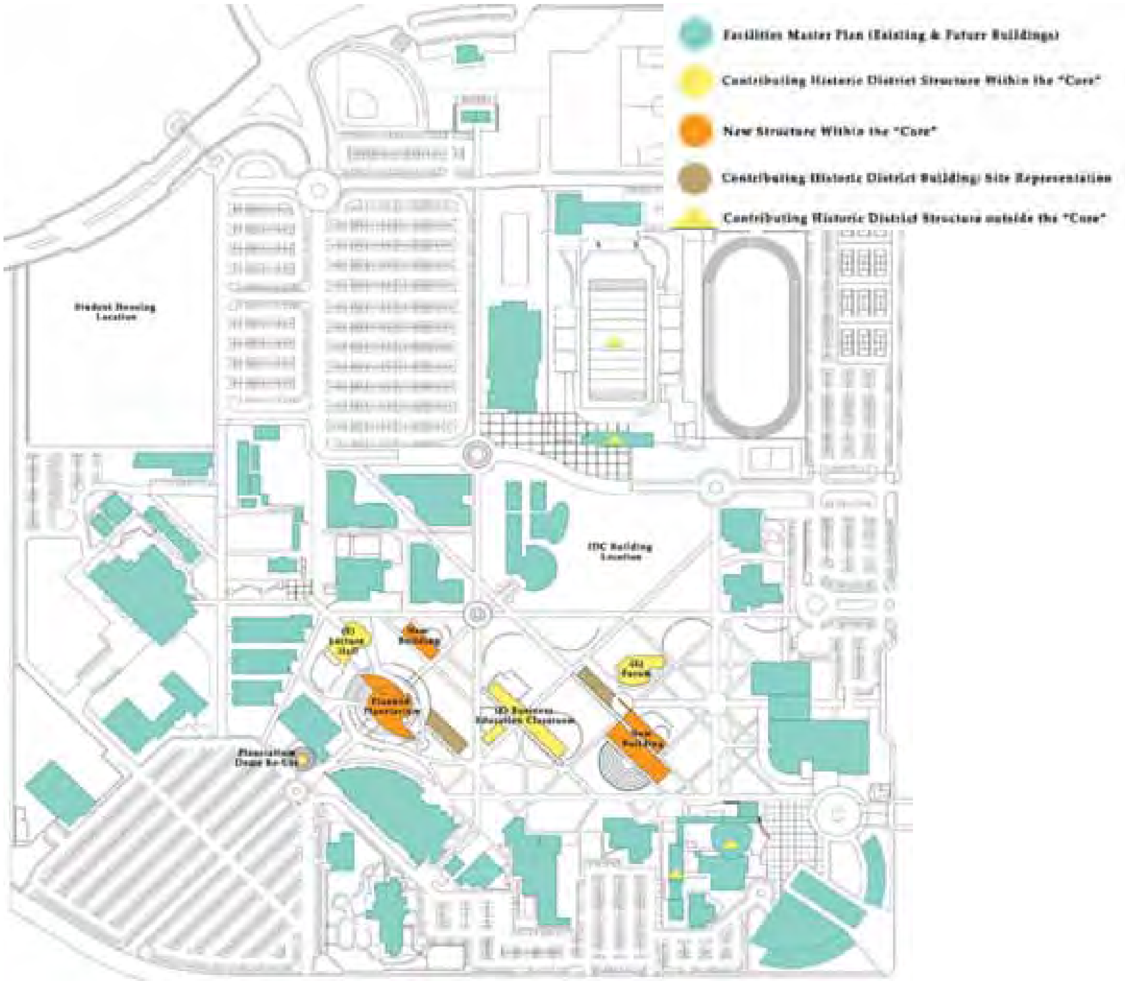

Figure 8: An illustration of the Strategic Reuse Alternative. Source: Draft Orange Coast College Vision 2020 Facilities Master Plan Program Environmental Impact Report, Figure 6-2.

Minimum Reuse

From the Chapter 6--Alternatives in the Draft EIR:

> The Minimal Reuse Alternative, as represented by [Figure 9], highlights the preservation and reuse of two buildings in the campus core: the Science and Math Lecture Halls and the Forum. The footprints of the Haley Business Learning Center and partial footprints of the Math Wing and Classroom and Lab Buildings would provide opportunities for patios, gathering places, and other outdoor spaces. The new Planetarium would stay in its originally planned location, and the old Planetarium's dome would be moved to serve as an entry element to the campus from the Merrimac Lot.[12]

[12] Direct text from draft EIR, 6-16

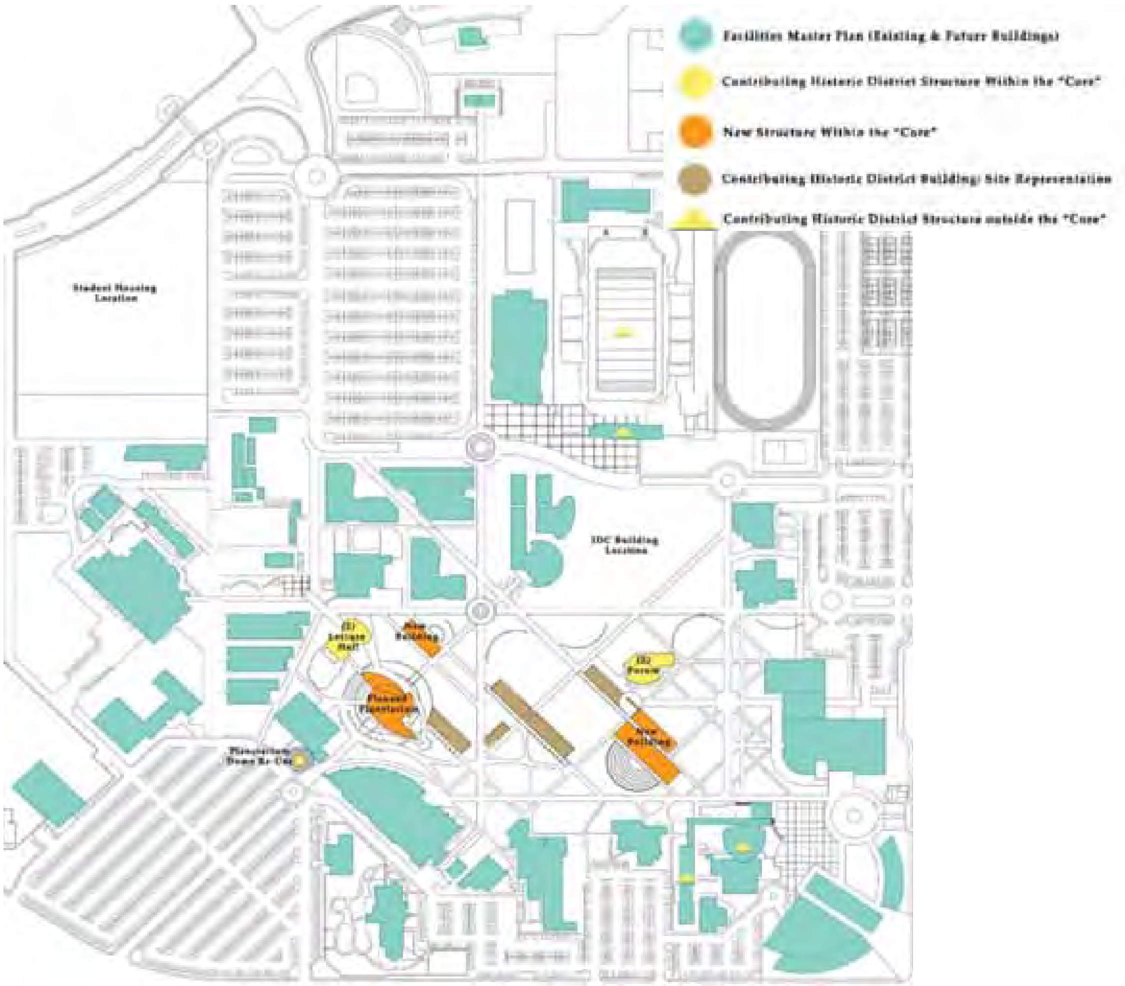

Figure 9: An illustration of the Minimum Reuse Alternative. Source: Draft Orange Coast College Vision 2020 Facilities Master Plan Program Environmental Impact Report, Figure 6-3.

The draft EIR concluded that because the Maximum Reuse Alternative retains and reuses buildings in the central core of the campus that are in the historic district, the historic integrity of the district would remain and impacts to historic resources would be considered less than significant. However, the draft EIR also concluded the following:

> The adoption of the Maximum Reuse Alternative would not meet the project objectives identified by the District [CCCD] for campus growth through 2024 because of the need for new instruction buildings to meet the educational goals for the campus and also the need to open up the inner core to create way-finding opportunities and defensible spaces. The preservation of the historic structures also hinders the ability to identify distinct zones on campus with the placement of new buildings.[13]

[13] Direct text from draft EIR , 6-12.

The Maximum Reuse Alternative fails to fully accomplish the project objectives in the CCCD's vision but has fewer environmental impacts than the Proposed Project and is therefore environmentally superior.

Under the Strategic Reuse Alternative and the Minimum Reuse Alternative, a number of contributing buildings would still be removed. Although the draft EIR concludes both alternatives would meet the project objectives identified by the CCCD for campus growth through 2024, the integrity of the historic district would be compromised and impacts to historic resources remained significant under these alternatives. The Strategic Reuse Alternative demolishes fewer buildings than the proposed project and has fewer environmental impacts but the historic district would not retain its eligibility for the California Register. Also, the Facilities Planning Committee recommended adoption of the Strategic Reuse Alternative to the CCCD's Board of Trustees, despite the fact that this alternative has significant and unavoidable impacts to historic resources.

Mitigation Measures

Because the proposed project has a significant impact on historic resources, mitigation measures were proposed to document the important history and architecture of the site and its overall historic association with the early development of the campus. The measures included:

- Recordation
    - A Historic Structures Report shall be prepared prior to any alternation, relocation, or demolition of any contributing buildings, structures, objects, features, or landscape elements located within the HRTR-identified OCC historic district.
    - Documentation in accordance with Historic American Building Survey (HABS) guidelines and standards, including large format photography and field photographs.
    - Available historic photographs and historic and/or current as-built plans of the site and its contributing resources reproduced digitally or photographically
- Salvage and reuse of key features, where feasible.
- Interpretive Educational Program with multi-media and 3-D public art display incorporated into the reconfigured campus quad area or library.

However, even with the mitigation measures, the impacts to historic resources under the proposed project are not mitigated to less than significant levels.

Public Comments

The Coast Community College District received a number of public comments objecting to the demolition of historic buildings designed by Neutra and Alexander at the College. The comments were received from regional and national historic preservation advocacy organizations as well as from local community members challenging the infeasibility of the project alternatives. To address the public comments as well as meet the mitigation measures, the CCCD engaged Page & Turnbull to prepare this HSR.

PART 1 – DEVELOPMENTAL HISTORY

PAGE INTENTIONALLY LEFT BLANK

1A. HISTORICAL BACKGROUND AND CONTEXT

Early Costa Mesa History[1]

The contemporary city of Costa Mesa is the result of three smaller communities that were established in the late nineteenth century with varying success: Fairview, Paularino, and Harper (Figure 1A-1 and Figure 1A-2).

Fairview was a small agricultural and tourism town that was established from the former Yorba family rancho lands in the 1880s, centered near the current intersection of Adams Avenue and Harbor Boulevard. Fairview developed quickly, particularly after the arrival of the Santa Ana, Fairview & Pacific railway; a spur line from Santa Ana that provided increased access for tourists visiting Fairview and the neighboring hot springs. However, the rate of development was not sustainable and the town began to decline. In 1889, a large storm washed out the railway line and it was never replaced, effectively quashing the town.

Paularino was founded on portions of Rancho Santiago de Santa Ana by Eduardo Polloereno. The first settlers, primarily from Boston, Massachusetts, arrived in 1886 and began to develop the small agricultural community in the area bounded by the current San Diego Freeway (north), Fairview Road (west), Baker Street (south), and Newport Boulevard (east). The town was unable to establish a commercial presence and ultimately failed.

Figure 1A-1: Historic map of Orange County, ca. 1921. Orange box illustrating zoomed in area, as shown at right. Source: Orange County Archives.

Figure 1A-2: Detail section of historic map of Orange County, showing locations of the towns Paularino and Harper (highlighted in orange), ca. 1921. Source: Orange County Archives.

Following the introduction of oil production within the Costa Mesa area in 1906, the town of Harper began to take form. Founded on the lands of rancher Gregory Harper Jr., the town quickly grew near the present-day intersection of Newport Boulevard and 18th Street. This included a

[1] The following section is summarized from Ostashay & Associates, "Orange Coast College Historic Resources Technical Report," in Draft Orange Coast College Vision 2020 Facilities Master Plan Program EIR, May 2014. Any additional sources will be cited accordingly.

general store, schoolhouse, post office, and an Episcopal church. Both the growing oil and agricultural industries in the area helped to establish the permanence of Harper by attracting an increasing number of settlers. The population boom resulted in more road construction, water infrastructure, and tract housing developments. The community of Harper officially changed its name in 1920 to Costa Mesa, roughly translating to “coastal tableland” in Spanish (Figure 1A-3). This refers to the coastal plateau on which the city is located.

Figure 1A-3: Newport Boulevard in Costa Mesa, California, ca. 1927. Source: Orange County Archives.

Over the next two decades, the population of Costa Mesa expanded from 200 to almost 5,000. Although the Great Depression and the 1930s brought economic hardship to the emerging city, development continued as migrants from other parts of the country moved to the area. The increase in population continued after the United States entered World War II. The Santa Ana Army Air Base was established in Costa Mesa and brought thousands of people to the surrounding area. Following the end of the war, large portions of the base that later became part of Costa Mesa were decommissioned to be used for agricultural land, tract housing development, and the campus location of Orange Coast College. In 1953, Costa Mesa was incorporated as a city after facing annexation pressure from the neighboring cities of Santa Ana and Newport Beach. At this time, it had a population of 16,840 and covered an area of 3.5 square miles.[2]

Tract housing development in Costa Mesa continued rapidly throughout the 1950s as people migrated to Southern California and Orange County. Many of these large residential developments, like Freedom Homes (1953), Sunshine Homes (1955), and College Park Homes (1956), featured the popular Ranch style houses, which were becoming synonymous with the postwar suburban Southern California lifestyle. The transition from rural to suburban development continued over the next several decades as the City of Costa Mesa sustained its expansion

[2] “Timeline,” Costa Mesa Historical Society, accessed March 4, 2015, http://www.costamesahistory.org/timeline.htm.

physically, economically, and institutionally. According to the 2010 census, the City of Costa Mesa currently has a population of 109,316.

Development of Junior Colleges (Community Colleges)

In the late nineteenth century, the concept of a junior college that bridged secondary and higher education started to develop among educators in the United States. Several related factors contributed to their development. Progressive educational reform during the period had transformed public education, which established secondary education as the norm and produced more high school graduates in demand for higher education. Existing colleges and universities expanded but could not keep up with the demand. Thus, some educators suggested the formation of two-year colleges could provide the first two years of general education courses so that universities could focus on research. At the same time, growing industrialization and larger businesses increased the need for skilled workers who could receive vocational training beyond that provided by high schools. Many communities also sought to have higher education institutions locally, not only to keep their best and brightest students close to home, but as a sign of their growing importance.[3]

By the early twentieth century, junior colleges had emerged as extensions of high schools that offered vocational and technical programs, or as smaller colleges with general education courses that could be transferred to a four-year university program. California was at the forefront of developing junior colleges. In 1907, the California legislature adopted the Upward Extension Law allowing high schools to offer "postgraduate" classes. Fresno High School first used the law in 1910 as the state's first public junior college.[4] In subsequent years, several junior colleges were established throughout California as extensions of high schools and often sharing campuses. These included Fullerton College (1913) and Santa Ana College (1915) in Orange County, both of which are still in operation as community colleges.

Between 1900 and 1920, 14 public junior colleges were established in California. They joined eight state colleges (teacher training colleges that were precursors to California State Universities) and two University of California campuses (Berkeley and the southern campus in Los Angeles) as California's public higher education institutions.[5] In the 1920s and 1930s, the junior college concept grew as additional legislation allowed for state and county support of junior colleges. California, Illinois, and Texas were the primary states to see growth in junior colleges. Twenty-five new junior colleges were established across California while only two State colleges were established during this period.

---

[3] For more on the development of junior colleges, see John Aubrey Douglass, *The California Idea and American Higher Education: 1850 to the 1960 Master Plan*, (Stanford, CA: Stanford University Press, 2000), 114-134 and James L. Ratcliff, "Community Colleges—The History of Community Colleges, The Junior College and the Research University," Education Encyclopedia-StateUniversity.com, accessed March 25, 2015, http://education.stateuniversity.com/pages/1873/Community-Colleges.html.
[4] Douglass, *The California Idea*, 122.
[5] Research stations in Davis, Riverside, and San Diego affiliated with the University of California were established in this period and would become full University of California campuses in the postwar period. Douglass, *The California Idea*, 345-348.

Heightened recognition of the importance of junior colleges came in the postwar years. The passage of the G.I. Bill in 1944 provided veterans with financial assistance for higher education and created unprecedented demand for access to colleges, universities, and training schools in the United States. The 1947 President's Commission on Higher Education (also known as the Truman Commission) called for a network of public junior colleges, or the newly introduced term "community colleges," that would charge little or no tuition, serve as cultural centers, be comprehensive in their offerings but with emphasis on civic responsibilities, and serve the areas in which they were located.[6] Similarly, the first attempt at creating a master plan for California's overburdened public higher education system acknowledge junior colleges as the embodiment of California's commitment to a democratic way of life. They provided vocational training for local high school graduates; general education for civic engagement; adult education; and lower-division courses for those who wished to move on to four-year institutions.[7]

By 1945, California had dozens of junior colleges across the state, but the limited resources during the Depression and World War II created a backlog of demand for new campuses. Between 1945 and 1949 alone, 15 new junior colleges were founded in California. However, with no state support for building programs and continued material scarcity in the immediate postwar years, many of the newly established schools used surplus military buildings and did not constructed their own campuses until well into the 1950s. Orange Coast College was among these junior colleges that started in the immediate postwar years and the only one in Orange County. Other contemporaries are El Camino College in Torrance, Monterey Peninsula College, Shasta College, and Los Angeles City Colleges in Wilmington and Van Nuys.

In 1960, the California Master Plan for Higher Education codified the state's tripartite higher education system (junior colleges, state colleges that became California State Universities, and the University of California campuses).[8] Unlike the limited California State and University of California universities, junior colleges opened enrollment to all and were a key component that democratized access to higher education. By allowing all high school graduates access to higher education, the local junior college also took pressure off enrollment at universities. In recognition of their role, state funding was provided for the first time to help junior colleges with building programs.[9] In 1967, the state legislature authorized the Board of Governors of the California Community Colleges to oversee community colleges throughout the state. This also changed the official designation of two-year programs from "junior colleges" to "community colleges."[10]

Additional federal legislation in the 1960s and 1970s further supported community colleges and community colleges saw dramatic increases in enrollment. Campuses underwent their greatest expansion during these decades.[11] The California Community College system is currently the

[6] The Truman Commission report also popularized the use of "community college" to refer to junior colleges. largest system of higher education in the country, serving over 2.1 million students at 112 different colleges throughout the state.[12]

Junior (Community) Colleges in Orange County

Following the 1907 adoption of the Upward Extension Law that allowed California high schools to offer "postgraduate" classes, the first junior college founded in Orange County was Fullerton Junior College (Figure 1A-4). It was approved by the Fullerton Union High School administration in the spring of 1913 and began offering two-year postgraduate programs the following fall with an enrollment of 28 students.[13]

In 1915, Santa Ana Junior College was founded, providing Orange County its second higher education institution. As with other early junior colleges, both Fullerton Junior College and Santa Ana Junior College were entirely affiliated with high schools. Although the original educational function of these colleges was to provide pre-university transfer courses, by 1915 there was a shift towards vocational programs appropriate for the local economy, such as agriculture and petroleum-related fields.[14] In 1916, Anaheim High School established the third junior college in Orange County; however, the college suspended operations due to lack of state funding and decreased enrollment following the United States entering World War I.[15]

The number of students enrolled at Fullerton and Santa Ana Junior Colleges rose exponentially over the years following World War I. By 1926, Fullerton Junior College had 235 students and offered a variety of programs including oil drilling technology, manual arts and shop, typing, stenography, and bookkeeping.[16] That same year, Santa Ana Junior College had an enrollment of 287 and by 1933 that number had increased to 803.[17]

With increased enrollment and diversification of courses offered, the need to separate from their high school counterparts became apparent, in terms of both facilities and educational autonomy. Between 1934 and 1935, Fullerton Junior College began acquiring land and developing a master plan for its own campus. Construction began on the 14-acre parcel later that year, largely through the funds and efforts of the Works Progress Administration (WPA). This initial period of campus development included the Commerce Building (1936), Administration Building (1937), Industrial Building (1937), and the Student Union (1938), all of which were composed in the Spanish Colonial Revival style.[18]

[18] "History of Fullerton College."

Although there were efforts to start a third junior college in Orange County prior to World War II, it did not gain traction, and no new colleges started until after the war.[19] In 1946, local leaders in southern Orange County organized to petition the state for a new junior college district to serve four high schools: Capistrano, Laguna Beach, Newport Harbor, and Huntington Beach. In 1946, the State Board approved the petition and the measure to form the Orange Coast Junior College District (OCJCD) was placed on the ballot for January 1947. Voters overwhelming approved it.[20]

Figure 1A-4: The College Building at Fullerton Union High School, ca.1927. Source: Fullerton College Library, http://libraryfchistory.fullcoll.edu/photos.php?image_id=253.

The new Orange Coast Junior College District established its first school, Orange Coast College (OCC) in Costa Mesa in 1948 on part of the former Santa Ana Air Army Base (SAAAB). Construction materials and capital were both in short supply in the immediate postwar years, so OCC initially repurposed many of the site's existing military buildings for the administrative, educational, and recreational needs. As the army buildings did not meet state education standards, new buildings were needed. The OCJCD hired Los Angeles-based architect Robert E. Alexander to develop a campus master plan. With a voter-approved limited local tax, OCC constructed the first postwar higher education college campus in Orange County between 1950 and 1957. The new campus was comprehensive and modern in style, construction methods, and educational programming with a Library, Technology Building (focused on courses for the local petroleum industry), Fine Arts Complex, Business Education, Agricultural Complex (still a major industry in Orange County), Science Building, and Speech Arts Building/Theater, as well as athletic facilities in the form of a football stadium, running track, and swimming pools (see below for more about OCC's development).

[19] Raymond M. Elliott and Sidney H. Davidson, "We Want a Junior College," in *From Tumbleweed to Roses: A History of Orange Coast College*, (Newport Beach, CA: Orange Coast College Faculty and Associated Student Body, 1964), 31
[20] Ibid., 43.

Orange County continued to develop through the 1960s, shifting from a primarily agricultural and petroleum producing community to become one of the quintessential suburban environments in the United States. This significant population growth increased the need for two-year postsecondary educational institutions. Orange Coast Junior College District established a second school, Golden West Community College, in Huntington Beach in 1965. Its 122-acre campus on former farmland, planned out by master architect William Pereira, opened to students in the fall of 1966.[21] With this second school, the OCJCD changed its name to Coast Community College District (CCCD) around 1970 (Figure 1A-5).

The Fullerton Junior College District also expanded during this period. It established Cypress College in Cypress in 1966 and became the North Orange County Community College District (NOCCCD).[22] Cypress College opened in 1966 using temporary buildings but Caudill Rowlett Scott (also known as CRS) of Houston, Texas planned a permanent campus that was constructed from 1967-1972. The campus buildings were designed in a Brutalist architectural vocabulary, as evident in the college's "Campanile," a large concrete tower set in a central plaza.[23]

In far southern Orange County, Saddleback College was founded in 1967 as the primary campus of the Saddleback Junior College District, now named the South Orange County Community College District (SOCCCD). The college first utilized a temporary location, which occupied 11 interim buildings that were rapidly constructed until a more appropriate site could be acquired. The community approved a $9.5 million bond to fund the acquisition and construction of a new 200-acre campus and construction began in 1970. The campus rapidly expanded over the years, eventually becoming one of the largest community colleges in Orange County.[24]

The 1970s, a tumultuous and transformative decade in the United States, saw several changes to the nature of community colleges in Orange County. First and foremost, the demographics of those enrolled became increasingly diverse. In addition, classes and programs would reflect upon these changes in the student body, moving towards an inclusive model rather than a divisive one.[25] In 1976, the community college took a new form in Orange County when Coast Community College District (formerly Orange Coast Junior College District) founded Coastline Community College. The school was planned specifically as a distance learning institution, serving the broader community through correspondence instead of in a traditional "brick and mortar" classroom setting. [26] This model was designed to provide non-traditional students, especially those with time conflicts, the opportunity to increase their education. Coastline College still lacks a traditional campus setting, although supportive and administrative complexes are now

located in the cities of Westminster, Garden Grove, Newport Beach, and Fountain Valley within the Coast Community College District.

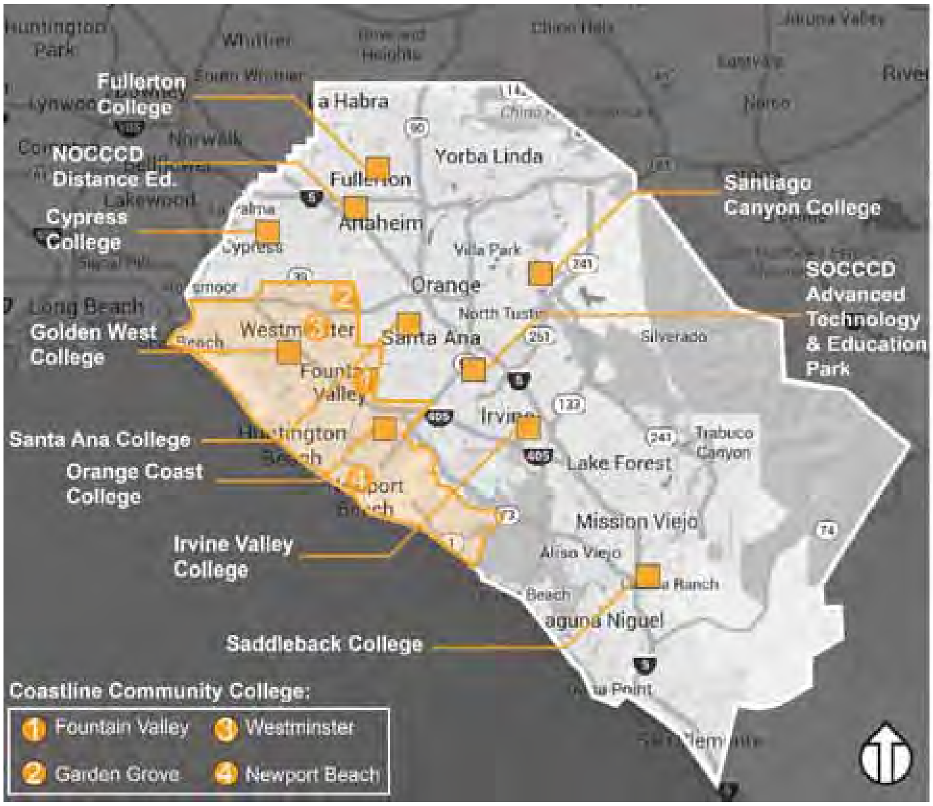

Figure 1A-5: Map of Orange County showing the location of all community colleges. Coast Community College District area is highlighted in orange. Source: Google maps image, edited by Page & Turnbull, 2015.

In 1979, Saddleback College established a satellite campus in the City of Irvine. Irvine was already served by the University of California, Irvine – the largest and most prominent postsecondary institution in Orange County. As extensive growth was forecast for the region, however, the need for a community college to better meet the educational needs in southern Orange County became increasingly apparent.[27] The small 20-acre Saddleback College satellite campus became an independently accredited community college and was renamed Irvine Valley College in 1985. That same year, Santa Ana College established a satellite college in the City of Orange. The 82-acre campus would remain tied to Santa Ana College until 1997, when it became an independent institution known as Santiago Canyon College. It was fully accredited as an institution in 2000.[28]

The community college districts in Orange County continue to expand, many of which have established distance and continuing education programs. Although much of this can be conducted via the internet now, brick and mortar campuses continue to be established. In 2002, the NOCCCD began work on a campus in Anaheim to serve as a new administrative center and

[27] "District Overview," *SOCCCD Education & Facilities Master Plan*, 20-21.
[28] "The Community College Idea."

continuing education campus.[29] The SOCCCD opened a preliminary campus in the City of Tustin in 2007 to serve as an Advanced Technology and Education Park. It is now on a permanent 68-acre location on a site formerly part of the Marine Corps Air Station in Tustin and is planning to expand.[30]

The Typology of the Junior (Community) College Campus

Collegiate Campus Planning and Architecture

Early American higher education campus design reached back beyond the founding of the country and was modeled on previously established English and European universities. At the University of Virginia in 1819, Thomas Jefferson created the defining American campus using a simple layout of a wide, tree lined central space flanked by a series of neo-classical pavilions that each housed an individual subject. The axis of the mall opened at one end to a view of surrounding plantations and it terminated at the other end with the library.[31]

In the nineteenth century, greater experimentation in higher education campus planning occurred in step with the architectural and town planning trends of the time and involved nationally-known designers. These new plans included the more natural settings of the picturesque ideal (such as at Stanford University), the formality of the Beaux-Arts movement (University of California, Berkeley), and the use of the Gothic Revival architectural style for collegiate buildings (Yale University).[32]

With the popularity of the City Beautiful aesthetic and planning movement in the late nineteenth century, the Beaux-Arts style of planning and architecture was the most widely accepted and applied. Strongly influenced by Jefferson's design at the University of Virginia, these campuses often had a longitudinal axis lined by academic buildings and dominated at one end by a strong focal point. Secondary axes and symmetrical layouts are also hallmarks. The buildings were designed in various classical or other revival styles such as Italian Renaissance Revival (University of California, Los Angeles) and Romanesque Revival (University of Southern California). In Southern California, the Mediterranean Revival and Spanish Colonial Revival styles were also frequently used, such as at Whittier College and Occidental College.

The dramatic shift to modern design in the post-World War II years affected college and school planning as well. Though some prewar modern campuses exist (most notably the Illinois Institute of Technology designed by modern pioneer Ludwig Mies Van der Rohe and Frank Lloyd Wright's Florida Southern College), postwar campuses turned to modern design both as the dominant style and as an economical and rapid means of constructing much needed buildings. Additionally, the formality and strict symmetry of the Beaux Arts gave way to a more fluid and informal approach, which responded less to spatial composition and visual coherence with the greater

campus and more to the programmatic, functional, and specific needs of the uses.[33] Typically, the new modern collegiate buildings of the 1940s and 1950s were built on available open space outside their existing campus cores. While modern in style and construction, these immediate postwar buildings were often of similar scale and massing and used the same material or color palette as the older buildings of their campuses. As high-rise construction technology advanced, and with material shortages no longer an issue, taller and larger buildings in other modern styles emerged in the 1960s and 1970s.

Southern California Public Schools

According to a historic context prepared for Los Angeles Unified School District, the earliest school buildings remaining were one- to two-story vernacular schoolhouses from the late-nineteenth century to the first decade of the twentieth century.[34] The 1920s saw a boom in school construction coinciding with the great population and development in Southern California. Most schools of this era typically had a main classroom and administration building, often sited along the street. Constructed out of masonry and often designed in Classical Revival, Mediterranean, or Spanish Colonial Revival architectural styles, the buildings were typically two to three stories, were rectangular or had side wings with a double-loaded corridor for classrooms or offices on both sides, and had large windows and high ceilings to take advantage of natural lighting and ventilation during school hours. An auditorium was common, either as a separate building or in its own wing. Cafeterias were sometimes included. Gymnasiums for the junior and senior high school levels were housed in separate buildings and were often more utilitarian in character. Shop buildings, also for high schools, were often located in industrial-like buildings with large spaces and open truss roofs.

The 1933 Long Beach Earthquake damaged several school buildings and resulted in legislation that required heightened seismic standards for public education buildings. Some school buildings were retrofitted, while new ones, built primarily in Art Deco and Moderne styles, were associated with New Deal programs that funded some of the construction. The 1930s also saw greater variety in school and campus plans reflecting progressive educational reforms and advances in ventilation, illumination, hygiene, sanitation, school furnishings, and landscaping.

In the post-World War II years, modern architecture, and specifically the midcentury variant of the International Style, was adopted for many schools. Pioneered in part by modern architect Richard Neutra in some 1930s Los Angeles area schools, the 1950s and 1960s schools were predominately one-story, open air plan campuses. Built in conjunction with and to serve growing suburban developments, these postwar schools were built where land was plentiful. They were characterized by sprawling, low clusters of “finger” buildings that allowed natural daylighting from two sides. Connected by covered walkways, the one-story design eliminated wasted space usually needed for corridors and stairwells and easily accommodated expansion with the addition of new wings and separate structures. Buildings and classrooms had individual patios or open

(March, 2014). Any additional sources will be cited accordingly.

courtyards to encourage air circulation and take advantage of the region's mild climate. The one-story design also reduced earthquake and fire risks with outdoor access readily available.

Junior College Campuses in California

As previously discussed, the early junior colleges were established in direct relation to a high school or a university. This provided the institutional and physical settings necessary for the colleges to develop their early programs.[35] Spare rooms and temporary, or underutilized, buildings were often used to accommodate the small classes. As programs and enrollment increased in the 1920s and 1930s, more established facilities were built to accommodate the influx of students and the unique developing programs. Many junior colleges began constructing their own wings or stand-alone buildings adjacent to the parent institution.[36]

Figure 1A-7: Aerial of Fullerton Junior College Campus under construction, ca. 1940. Source: Fullerton College Library.

In terms of planning, they shared the ambition of colleges and universities in following Beaux-Art planning principles (Figure 1A-6). However, these early campuses had only a few buildings constructed initially- usually a general classroom facility, administration building, and a library

[36] This information has been accumulated from written histories of several Junior colleges founded between 1910 and 1935: Fullerton College, Santa Ana College, Fresno City College, Pasadena City College, Glendale City College, and San Francisco City College. Full citations are available in the Bibliography Section.

(Figure 1A-7). Additional buildings were constructed according to a master plan and evolving needs of the college. Some junior college facilities built during this time, in addition to many other educational buildings, were done so through the influx of federal funding and readily available construction labor through New Deal programs, like the Public Works Administration (PWA) and the Works Progress Administration (WPA).[37]

As with four-year colleges and universities, the postwar junior college campus shifted away from strict Beaux Arts stylistic requirements and began to focus more on aspects like circulation, functional and spatial organizations, prospective growth, and efficient facilitation of college programs. Unlike established universities, junior colleges drew students locally rather than state- or nation-wide. The colleges' focus on their immediate communities, in addition to the proliferation of automobiles, created the "commuter campus" model where new elements, like surface parking lots and vehicular circulation patterns, became integral to the campus design while traditional campus amenities, such as dorms, were no longer necessary.[38] With their stronger community connections, junior college facilities, like theaters and art galleries, were used by the community as well.

The broad spectrum of junior college programs- offering academic transfer to four-year universities, vocational and technical programs, liberal arts education, continuing education, developmental education, recreational opportunities, and cultural services- required a variety of building types to facilitate the institutions' educational missions.[39] Common programs in the postwar years that required specialized facilities included:

- Business Education (typing, accounting, office practice, etc.)
- Technology (metal trades, building trades, etc.)
- Arts and Crafts (drafting, ceramics, photography, etc.)
- Home Economics (sewing, cooking, etc.)
- Science
- Language Arts
- Theater and Music

Like university campuses, the junior college had libraries, student unions, athletic facilities, and separate administration buildings to encourage campus life and improve the physical health of its students and the community.

In the immediate postwar years, the demand for more facilities to accommodate the exponential rise in enrollment was a pressing issue. However, these buildings were seldom built all at once and were often constructed over several years. This was due in part to limited access to building materials and resources, which were often diverted to deal with the immense housing shortage.[40]

Most postwar junior college buildings were one to two stories, sited to take advantage of natural lighting and ventilation, and composed in a Mid-Century Modern architectural style. The rational configurations and functional adaptability of modern architecture provided the developing postwar community college with a practical and flexible space.[41] However, by the 1960s, many community colleges were adopting a variety of modern architecture styles, creating a more cohesive aesthetic and identifiable brand specific to the campus.[42]

Figure 1A-8: Historic photo of Foothill College in Los Altos, California, ca. The 1960 campus features a cohesive regionally inspired modern architecture. Source: Docomomo US, http://docomomo-us.org/files/NoCaFoothill.jpg.

Junior college campuses constructed in the late 1950s and 1960s also deviated from earlier postwar campuses in that many were built at once. One reason was that state funding became available to junior colleges for capital improvements. Additionally, postwar material shortages were no longer an issue. Once a community college was founded, operations began the following fall in temporary facilities. Classes would continue at this temporary site while master plans and campus designs were formulated by a single architect or firm and then constructed. This method of planning and building meant that a college had a fully functional and architecturally cohesive campus in one to three years. For example, Foothill College in Los Altos, California, was founded in 1958, and its core campus was built between 1958 and 1961 in the regional Bay Area Modern style (Figure 1A-8). Existing junior colleges also initiated building programs during the 1960s and moving into the 1970s that significantly expanded their campuses.

Educational and technological advancements during the 1970s, 1980s, and 1990s had a resounding impact on the typology of community college campuses in California. Seemingly outmoded programs, such as agriculture, home economics, and typing, were replaced by more contemporary fields, like horticulture, culinary studies, and computer science. These curricular changes, linked with changes in education theory, architectural expression, funding options, and seismic requirements, often led to new buildings being constructed specifically to facilitate new or rapidly evolving programs being adopted by the college.

California's community colleges today are becoming increasingly similar to university campuses, albeit typically on a smaller scale. As enrollment numbers have become comparable to large universities, the sizes of community college buildings have increased to accommodate several thousand more students. Expanded libraries, facilities for advanced technology programs, and student dormitories are also becoming common fixtures on many community college campuses today. This, in part, is a reflection of overcrowding and increased tuition at public universities. Furthermore, some community colleges are expanding to offer four-year baccalaureate programs, particularly in fields where regional educational opportunities are limited.[43]

Modern Architecture in Southern California[44]

Southern California, with its varied history, Mediterranean climate, and accommodating creative character was a hotbed for architectural experimentation throughout the twentieth century. Along with the local Craftsman and Spanish Colonial Revival styles that dominated the region in the early twentieth century, innovators like Frank Lloyd Wright and Irving Gill took advantage of the mild climate and experimented with modern design generally independent of the Bauhaus school and rise of the Modern movement in Europe. The arrival of Austrians Rudolph Schindler and Richard Neutra in the late 1910s and early 1920s helped to introduce the International Style to Southern California.

These early modernists – Irving Gill, Frank Lloyd Wright, and Rudolph Schindler – often took inspiration from traditional architectural forms of the American Southwest, Mexico, and Japan, translating them into a new vocabulary through the use of modern materials and construction techniques. Concrete was the primary material of choice for its fireproof qualities, malleability, strength, and minimal maintenance required. As with modern architecture elsewhere, ornamentation became more abstracted, expressionist, or removed entirely. The natural aesthetic qualities of the building materials, the overall simplicity and honesty of the composition, and the integrated landscape became the ornamental features of a building. Like the regional architects before them, the mild climate inspired incorporation of the outdoors as a year-round extension of the living space. Sliding glass walls, sleeping porches, expansive windows, and the patio were rendered in a modern idiom. Technological and material advancements further allowed the barriers between the indoor and outdoor to erode and, indoor/outdoor living became synonymous with the Southern California lifestyle.

[44] The following section was summarized from, Tom Hines, *Architecture of the Sun: California Modernism, 1900-1970* (New York: Rizzoli International Publications, 2010). Any additional sources will be cited accordingly.

As with other parts of the country, modern architecture dominated in the years after World War II. The umbrella term "Mid-Century Modern" is often used to describe the postwar iteration of the International Style.[45] With greater exposure of modern design through national publications like *Architectural Record, Architectural Forum,* and *Progressive Architecture* and the prewar works of Neutra and Schindler, architects like Charles Eames, Gregory Ain, Pierre Koenig, A. Quincy Jones, and Craig Ellwood soon adapted the Modern movement's design approach, technological innovation, and social progressiveness to California's outdoor living, optimistic outlook, and booming residential development. They in turn gained national prominence through their involvement with the Case Study House program sponsored by Los Angeles-based *Arts & Architecture* magazine.

Steel, glass, concrete, aluminum, and other modern and industrial materials developed in the war effort were employed in all building types. The construction techniques, expansive glass walls, geometric forms, horizontal orientations, open floor plans, and integrated outdoor spaces became the hallmarks of Mid-Century Modern in Southern California. Simultaneously, landscape architects, like Thomas Church and Garrett Eckbo, were experimenting with these same modern materials and forms to further develop the outdoors as habitable room-like spaces and part of the casual, informal California lifestyle. As the years progressed into the late 1950s and 1960s, the aforementioned architects and others like William Pereira, Welton Becket, Robert E. Alexander, and Albert C. Martin Jr. designed larger and more complex projects throughout the region. Additional variants of modern design, including New Formalism and Brutalism, offered variety to the International Style underpinning of Mid-Century Modern.

Robert E. Alexander, FAIA (1907-1992)[46]

Figure 1A-9: Robert E. Alexander. Source: https://barbaralamprecht.files.wordpress.com/2012/06/robert-alexander.jpg.

Robert Evans Alexander (Figure 1A-9) was an influential figure in the development of midcentury urban design and planning in Southern California. He was a proponent of a rational, methodical, and well-researched approach that extended beyond pure aesthetics. Although his architecture was very much a product of modernist theory, his designs had an ingrained humanist element, reducing the often perceived coldness of strict modernism.

Born in Bayonne, New Jersey in 1907, Robert Evans Alexander graduated from the Cornell University School of Architecture in 1930. After completing further architectural studies in Western Europe, he moved to Southern California and had established himself as a partner in the Pasadena-based firm of Wilson, Merrill, and Alexander by 1936.[47] The firm's profile grew in 1937 when it began collaborating on the Baldwin Hills Village with local architect Reginald Johnson and nationally noted planner Clarence Stein (Figure 1A-10). As an example of progressive community housing, the 64-acre housing development was very influential in its overall site plan, which allowed for easy automobile access and circulation without infringing on pedestrians, the shared open spaces, or the sense of place. The buildings are a mix of simply designed two and single-story apartment buildings arranged around expansive insular communal green spaces. Parking garages, access roads, and other utilitarian spaces were placed at the site's periphery, ultimately serving as a buffer between the outlying urban environment and the central open space. This project exposed Alexander to large scale urban planning.[48] Baldwin Hills Village is listed in the National Register of Historic Places and was designated in 2001 as a National Historic Landmark, the highest designation of national significance, as an innovative and humanistic example of community housing developed during the automobile age.

During World War II, Alexander collaborated on the design of public and wartime housing projects and worked for the Lockhead Aircraft Corporation. Thereafter, he began practicing as an independent architect. One of his projects was the public elementary school near Baldwin Hills Village (Figure 1A-10). He also became increasingly involved in urban planning as a member of the City of Los Angeles Planning Commission; by 1948, Alexander had become president of the commission. It was during this period that he and Richard Neutra, who was impressed with Alexander's work at Baldwin Hills Village, began collaborating on a redevelopment study of the

Sacramento riverfront.[49] They also developed a proposal for an unrealized public housing development for Chavez Ravine. The two would develop a partnership from 1949 to 1958 that combined their individual talents to work on commercial, institutional and educational projects at a scale larger than each could do on their own, including Orange Coast College, which spanned the period of their partnership (see Neutra and Alexander section below).[50]

Figure 1A-10: Historic photo of Baldwin Hills Village, ca. 1958. Julius Shulman Photography Archive. Copyright The J. Paul Getty Trust. The Getty Research Institute, Los Angeles. ID no.: gri_2004_r_10_b257_f04_002.

In 1959, Alexander founded his own firm of Robert E. Alexander & Associates in downtown Los Angeles. In the following decades, Alexander continued his role as both architect and urban planner. These projects include Bunker Hill Residential Towers in Los Angeles (1968), and several higher education projects such as the University of California San Diego master plan (1963), University of California, San Diego School of Medicine (1968), and Baxter Hall of Humanities at the California Institute of Technology (1971), in addition to others. In many of these later projects, Alexander's approach used the evolving forms of modernist styles that were developing in the 1960s and 1970s. Alexander moved to Berkeley, California in 1982 and would remain there until his death in 1992.[51]

Richard Neutra, FAIA (1892-1970)[52]

Figure 1A-11: Richard Neutra on the cover of *Time,* August 15, 1949. Source: http://content.time.com/time/covers/0,16641,19490815,00.html

Richard Neutra was one of the early masters of modern design in America (Figure 1A-11). His interpretations of the modern aesthetic, although featured on an international scale, became synonymous with Southern California through much of the twentieth century.

Neutra was born in Vienna, Austria in 1892. He began his studies at the Vienna Institute of Technology where he studied architectural engineering and was first introduced to the Modern movement through his instructor, and famous early modernist, Adolf Loos. He continued his studies at the University of Zurich, graduating in 1919. Soon thereafter, Neutra moved to Berlin and began working with Erich Mendelsohn on several projects in Germany. Mendelsohn was an influential figure in the development of modern architecture for his pioneering use of expressionist and streamlined architectural forms.

In 1923, Neutra immigrated to the United States. After brief stays in both New York and Chicago, as well as at Frank Lloyd Wright's Taliesin office in Wisconsin, Neutra eventually settled in Los Angeles. He began working with fellow Austrian and good friend, Rudolph Schindler, who had immigrated to Los Angeles prior to World War I and had established an architectural practice. The partnership was short lived, but the connections Neutra made in Los Angeles earned him many of his early commissions, most of which were single-family residences. Neutra's work had many parallels to the International Style that was developing in Europe, albeit with Southern Californian variations. This "biorealist" style that Neutra developed called for organic compositions, emphasis on the natural aesthetic qualities of materials, and integration of the outdoors into interior spaces through the use of large sliding glass walls, optimally placed clerestories, and carefully sited patios. These measures ensured maximum privacy and enjoyment of the Southern California landscape. Among the dozens of prewar residential projects, the Lovell Health House (1927-1929) and his own VDL Research House (1932, rebuilt after fire 1968) are the most well-known.

Savvy with publicizing his projects, Neutra received significant coverage in various national and international architectural journals, often with photographs by master photographer Julius Schulman who began his influential architectural photography career with a Neutra project. In 1949, Neutra was featured on the cover of *Time* magazine following the completion of his most prominent modern residence, the Kaufmann Desert House (1946) in Palm Springs. His influential books included *Architecture of Social Concern* (1948), *Mystery and Realities of the Site* (1951), *Survival Through Design* (1954), and *Life & Human Habitat* (1956).

[52] The following section is summarized from Ostashay & Associates, "Orange Coast College Historic Resources Technical Report." Any additional sources will be cited accordingly.

In 1949, Neutra formed a partnership with fellow architect Robert E. Alexander (described below). The partnership focused on larger-scale project planning, commercial and institutional projects. Neutra continued to design single-family residences separate from the partnership.[53] The partnership ended in 1960 due to personal differences, though they continued to finish the shared projects well into the 1960s. Neutra then established a new firm—Neutra and Associates—with his son Dion Neutra, who continued the practice after his father's death in 1970. Among the most influential Southern California architects, Neutra's legacy has grown in the subsequent years.

Neutra and Alexander (1949-1958)

Architects Richard Neutra and Robert E. Alexander began collaborating on projects in 1949 with proposals for an early redevelopment project in Sacramento, California and a public housing project in Chavez Ravine in Los Angeles. These two projects were ultimately unbuilt, but the two architects continued to pursue projects together. When Alexander asked Neutra to enter a joint venture with him on Orange Coast College, the collaboration morphed into a productive decade-long partnership for both.[54]

Alexander was knowledgeable and skilled in the planning processes of large sites, while Neutra was at the height of his public recognition with the *Time* cover article. Both had skill sets, reputations, and connections that complemented each other and by joining forces, they expanded their capacity, and staff, to realize larger scale commercial and institutional projects requiring both comprehensive planning and a keen eye for architectural detail.[55] Though not an incorporated entity, both Richard Neutra and Robert E. Alexander's names appeared on the title block and the projects are attributed to Neutra and Alexander.

The partnership produced projects that spanned educational, multi-family residential, recreational, institutional, and commercial uses. These projects included Orange Coast College (1951-57), the Redevelopment Plan for Guam (1952), Mountain Home Air Force Base Housing (1955), the National Charity League Observation Nursery School (1955), the Dayton Planetarium and Museum of Natural History (1957), the United States Embassy in Karachi (1959), the Los Angeles County Hall of Records (1962), the Lincoln Memorial Museum/Cyclorama Building at Gettysburg National Park in Pennsylvania (1962); and the Painted Desert and Petrified Forest National Park Visitor's Center and Community in Arizona (1964).[56] The last two projects were commissioned through the National Park Service's distinguished Mission 66 program, which improved access and introduced modern visitor centers within national parks ahead of the agency's 50th anniversary in 1966.

During his partnership with Alexander, Neutra continued his own private firm based out of his Silver Lake home office, working on single-family residential commissions while contributing to the partnership. Alexander managed the collaborative firm's regular operations out of the office on Glendale Boulevard. The firm continued in this fashion until strains, both operational and

personal, reached a breaking point in 1958.[57] As such, no new projects were taken on collectively after 1958 but projects that were already underway were completed over the following years.

Educational Projects

Although Neutra gained much of his early critical accolade and fame for his residential projects, his prewar work also extended to schools. He was a proponent of progressive educational models emerging out of the same period as the Modern movement. The first school design Neutra developed was an elementary school, appropriately named the "Ring Plan School" in 1928. The plan called for a series of classrooms arranged in a single-story ring with individual courtyards radiating out from the building as outdoor extensions of the classroom spaces. A shared insular courtyard was located in the center of the ring with administrative offices extending out from the configuration. Neutra intended the design to provide a modern, adaptable, and progressive educational setting that would allow for immediate access to the outdoors.[58] His was among several prototypes for open-air schools that developed in the early twentieth century.

Figure 1A-12: Outdoor classroom space with sliding glass walls at Corona Avenue School, ca.1953. Julius Shulman Photography Archive. Copyright The J. Paul Getty Trust. The Getty Research Institute, Los Angeles. ID no.: gri_2004_r_10_b0079_f012_1545_04.

Figure 1A-13: Classroom with sliding glass doors at Alamitos Intermediate School, ca.1957. Julius Shulman Photography Archive. Copyright The J. Paul Getty Trust. The Getty Research Institute, Los Angeles. ID no.: gri_2004_r_10_b0082_f014_2454_40.

Neutra continued to build upon his educational plans and philosophies. He treated the classroom as a living space that required flexible and adaptable space, abundant natural lighting and ventilation, and access to the outdoors as a usable space and extension of the classroom. The importance of nature as an essential component to the learning process is central to Neutra's designs. Clerestory windows, sliding glass walls, outdoor classroom spaces, open-air covered walkways, and low-profile rectilinear layouts became common architectural elements in Neutra's pioneering school designs at the Corona Avenue School (1935) (Figure 1A-12) and Emerson Intermediate School (1937) .[59]

[59] McCoy, *Richard Neutra,* 21-22

Neutra and Alexander collaborated on several educational projects, building upon Neutra's programs and educational philosophies of the 1930s. Their commissions included Kester Avenue Elementary (1951) in Los Angeles, Alamitos Intermediate School (1957) (Figure 1A-13) in Orange County, and Palos Verdes High School (1961) in Los Angeles County. He and Alexander also tackled the programmatic challenges for progressive schools with teacher training and child observation components such as the UCLA Kindergarten & Elementary School (1957). Many features from Neutra's prewar schools became the standard vocabulary for the modern postwar California public school.

For institutions of higher education, Neutra and Alexander designed a collection of classroom buildings, athletic facilities, and a large theater for Orange Coast College (1950-1957), as well as individual buildings at California State College, Northridge (1959, demolished c.1994); the University of Nevada, Reno (1961); and the library complexes for Simpson College in Indianola, Iowa (1956-61) and Adelphi University in Garden City, New York (1955-63).[60] At St. John's College in Annapolis, Maryland, Neutra and Alexander designed Mellon Hall, an interconnected music and science complex that included classrooms, labs, a theater, and a small planetarium (1958-1959). The stand-alone modern complex complemented the scale and design of St. John's more traditional existing campus buildings. St. John's College restored, modernized, and expanded Mellon Hall in 2002.[61]

Garrett Eckbo (1910-2000)[62]

Figure 1A-16: Portrait of Garrett Eckbo, ca. 1959. Julius Shulman Photography Archive. Copyright The J. Paul Getty Trust. The Getty Research Institute, Los Angeles. ID no.: gri_2004_r_10_b261_f10_001.

Garrett Eckbo is one of the most influential American landscape architects to practice during the postwar years (Figure 1A-16). His approach, designs, and publications were heavily shaped by the progressive politics of the New Deal era and the proliferation of Modernist theories into American design practices.

Eckbo was born in Cooperstown, New York in 1910, but moved to Alameda, California with his mother in 1912. Eckbo enrolled at the University of California, Berkeley's Division of Landscape Design and Floriculture in 1932. In 1936, Eckbo received a scholarship to attend Harvard University's Graduate School of Design (GSD). The program's traditional Beaux-Arts curriculum was a source of frustration for Eckbo who viewed it as out of touch with the harsh realities of the Great Depression.[63] Eckbo rejected historicist design elements in favor of new forms and materials, which he felt were better suited for a modern world with modern problems. In addition, he rejected the garden as a purely aesthetic construct and professed that landscapes should be usable as recreation and living spaces for all. Fortunately for Eckbo, the GSD experienced a period of restructuring under the guidance of architect Walter Gropius, founder of the Bauhaus school and prominent figure in the development of modern architecture under the Modern movement. Eckbo's work at Harvard was characterized by a collaborative and multi-disciplinary approach that become a hallmark of his design theories.[64]

Upon graduating in 1938, Eckbo moved back to California to begin working for the federal New Deal's Farm Security Administration, where he designed resettlement communities meant to accommodate migrant workers throughout the American Southwest. During World War II, Eckbo's focus shifted to the planned housing of defense workers in California. In 1946, Eckbo moved to Los Angeles to start a southern branch of his firm Eckbo, Royston and Williams. He initially rented office space from Robert E. Alexander in Baldwin Hills and established a long-term working relationship and friendship with the architect and planner.

In Southern California's postwar residential boom, Eckbo experimented with small-scale residential gardens using modern wartime materials. Like other modern landscape architects of the period, Eckbo saw the landscape as an extended living space integrally tied to residential interiors. He frequently incorporated patios, pools, and other structures into his designs, ultimately

[62] The following section is summarized from Ostashay & Associates, "Orange Coast College Historic Resources Technical Report." Any additional sources will be cited accordingly.

[64] Ibid.

designing outdoor rooms within the landscape. The most famous of these residential experiments was the Forecast Garden (1956) at his own residence, which was partially commissioned by the Aluminum Company of America (ALCOA) to demonstrate peacetime applications of aluminum in residential design (Figure 1A-17 and Figure 1A-18).[65]

Figure 1A-17: ALCOA Forecast Garden, ca. 1959. Julius Shulman Photography Archive. Copyright The J. Paul Getty Trust. The Getty Research Institute, Los Angeles. ID no.: gri_2004_r_10_b261_f11_012.

In addition to the countless small garden schemes he designed for residential projects by noted modernist architects, Eckbo also worked on landscape schemes for a few influential modern suburban residential developments in Los Angeles: Mar Vista Housing Tract with architect Gregory Ain and Crestwood Hills with architect A. Quincy Jones. In addition, Eckbo became increasingly involved in the design of commercial and institutional landscapes. He crafted public spaces that integrated buildings and people, as demonstrated in his pedestrian walk at the outdoor pedestrian Fulton Shopping Mall in Fresno, California (1966). Later Los Angeles area projects featuring Eckbo designs include the campus landscape for Ambassador College (1965) and Union Bank Plaza (1968).[66]

Eckbo left Eckbo, Royston, and Williams in 1958. In 1963, Eckbo returned to Northern California to serve as head of the Landscape Architecture Department at University of California, Berkeley from 1963 to 1969. In 1964, Eckbo would cofound the landscape architecture firm of Eckbo, Dean, Austin, and Williams (EDAW).[67] Eckbo became disenchanted with the automobile-oriented suburban environments that he had helped design, and he moved towards crafting landscapes that were less manufactured and more public and accessible to pedestrians. He shifted from the regimented and industrial esthetics of his postwar designs and began to incorporate increasingly naturalistic landscape elements. His hardscape integrated boulders, plantings become less geometric, and the landscape scheme would be opened up for less structured interaction.[68]

[68] Ibid.

Eckbo died in Berkeley in 2000 after gaining a legacy of thousands of gardens, hundreds of public spaces, internationally recognized firms, and several publications that continue to influence the contemporary practice of landscape architecture.

Peterpaul Ott, Sculptor (1898-1992)

Peterpaul Ott was born in 1898 in Pilsen, then a city in the Austria-Hungary, but now part of the present-day Czech Republic. While growing up, Ott became increasingly interested in art, leading him to enroll in the Royal College of Fine and Applied Arts in 1912 in Dresden, Germany.[69] His studies were interrupted by the outbreak of World War I, but he would continue his education at the Austrian State Academy of Fine Arts following his service during the war.[70]

With the postwar economic crises in Germany, Ott immigrated to New York in 1924 where he found work carving furniture while attending art school at Cooper Union. There, he studied under the famous avant-garde sculptor, Alexander Archipenko, who was a significant influence in Ott's stylistic development.[71] In 1931, Ott moved to Chicago for a teaching position at Northwestern University. From 1936 to 1939, he served as the Works Progress Administration's (WPA) Supervisor of Sculpture in Chicago. During this time, he completed dozens of pieces incorporated into the interiors and exteriors of many of the Chicago WPA projects. Many of these works featured stylized and abstracted Hellenistic, Egyptian, and Babylonian forms, which were to remain a constant throughout his career.[72]

In 1941, Ott moved to Laguna Beach, California. He continued teaching in various Orange County high schools, working on his art, and establishing the arts community in Laguna Beach as one of the first formally trained artists to settle there. His involvement helped to establish Laguna Beach as a hotbed of arts and culture in Orange County. Although he officially retired in 1967, Ott continued to sculpt, teach, and contribute to the arts community of Orange County until his death in 1992 at the age of 97.[73]

1B. CHRONOLOGY OF DEVELOPMENT AND USE

Santa Ana Army Air Base

Although the United States had yet to enter World War II in 1940, the German blitz in that spring spurred the U.S. military to expand its air capabilities rapidly.[1] Pilot training was needed, and in February 1942, the Santa Ana Air Corps Replacement Training Center opened in Costa Mesa, California. One of three replacement training centers in the country, the Santa Ana installation became the largest to offer pre-flight training during World War II, as well as the only one to offer training for pilots, bombardiers, and navigators.[2]

The center was renamed the Santa Ana Army Air Base (SAAAB) not long after. The base eventually reached the size of 1,283 acres and included land bounded roughly by Harbor Boulevard to the west, the diagonal Newport Boulevard to the east, Wilson Street to the south, and Baker Street to the north (Figure 1B-1).

Figure 1B-1: Aerial photograph of SAAAB, ca.1943. North is up. Harbor Blvd. is at the left edge and Newport Blvd. is the diagonal street at the bottom right. Area originally set aside for Orange Coast College in orange. Source: Edrick J. Miller, *The History of the Santa Ana Army Air Base*.

The SAAAB constructed hundreds of buildings for its training use, including barracks and mess halls, a hospital area, post exchange buildings, theater, recreation buildings, and school buildings.[3] The site was laid out in a rectilinear grid, with four blocks of barracks sharing a central mess hall. The construction company used prefabricated materials and assembly-line methods to

[2] Ibid., 16.
[3] Ibid., 21.

construct the needed number of buildings quickly; seven two-story barracks and six one-story buildings were erected each day at the height of base construction.[4]

After the war ended in 1945, SAAAB first housed German prisoners of war but ultimately became surplus war property. By March 31, 1946 the base had become inactive. The War Assets Administration took control of SAAAB in June 1947 and began advertising the site for sale.[5] The multi-acre site was eventually parceled for various uses, including the Orange County Fairgrounds, Costa Mesa High School, Davis Junior High School, TeWinkle Park, Costa Mesa City Hall, and a new campus for Southern California Bible College (known today as Vanguard University).

Orange Coast College

After the Orange Coast Junior College District (OCJCD) was approved by ballot measure in 1947, this new district focused on starting its first junior college, Orange Coast Junior College. After much negotiation, the OCJCD finally acquired approximately 243 acres of SAAAB between Harbor Boulevard to the west and Fairview Avenue to the east in late 1947 and early 1948. Included were 58 existing Army buildings. The federal War Assets Administration gave the land and buildings to the OCJCD with a 100% educational discount, allowing the college to be established with no bond issue or special tax.[6] In 1948 Dr. Basil H. Peterson, then president of Glendale City College as well as president of the California Junior College Association, became the new OCJCD's first superintendent; he led Orange Coast College until 1964.[7]

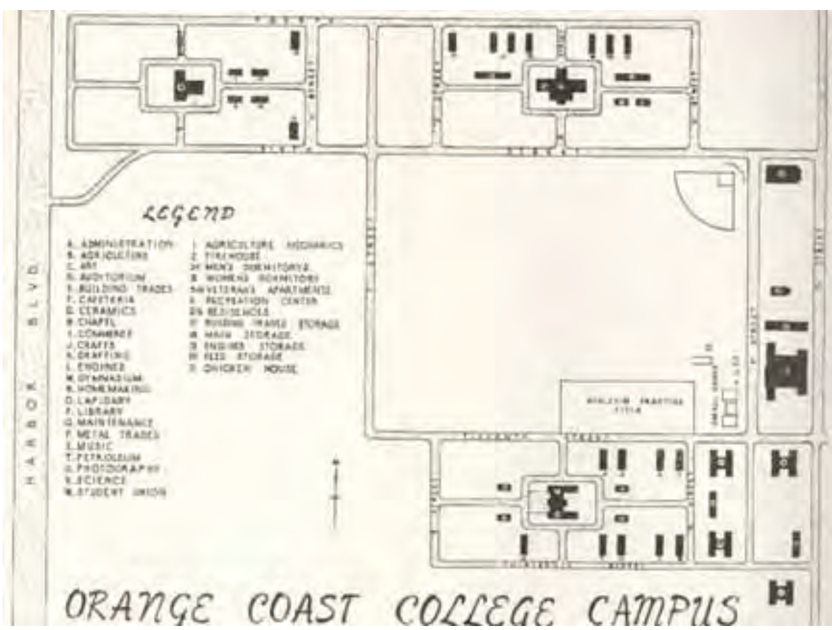

Figure 1B-2: Orange Coast College campus map in 1949 with site plan and buildings inherited from the former SAAAB site. Source: OCC Archives.

[4] Miller, *The SAAAB Story*, 25.

[6] Board of Trustee meeting minutes, Orange Coast Junior College District, December 13, 1948, available at Coast Community College District Office.
[7] Unknown - *From Tumbleweed to Roses: A History of Orange Coast College*, (Newport Beach, CA: Orange Coast College Faculty and Associated Student Body, 1964), 47 and 52. Based of digital version, author is unclear.

The OCJCD planned to start classes in September 1948 within the existing Army buildings (Figure 1B-2). Most were wood-framed two-story barracks, of which a few were used to house students and veteran students' families, while others were adapted for classrooms, shops, gymnasium, cafeteria, library and auditorium.[8] However, the Army buildings did not meet the State Division of Architects' fire standard, and the college district agreed to a temporary two-year use while upgrading buildings or replacing them with permanent buildings.

Dr. Peterson met Robert E. Alexander at the State Superintendent's Conference in Long Beach, where the architect had an exhibit. According to Assistant Superintendent William Kime, "The man who seemed to have the most progressive ideas [at the exhibits] was Mr. Alexander. In addition to being alert to the problems of junior college education, he seemed willing to tackle the problem of evolving a master plan around, among and between army buildings, which would remain in use."[9] Peterson subsequently hired Alexander to advise the OCJCD on campus development. Alexander recalled, "The understanding was simply a gentleman's agreement that I would be paid on a time basis for the master planning. There was no formal agreement that I would get to design all the buildings in the master plan, but that I should be assured of their good will, and that as long as I provided satisfactory services, I would do their work."[10]

In late 1948, the OCJCD board engaged Alexander and his team to appraise and advise about the campus's existing buildings, analyze the OCJCD's population now and in the future, and propose a development plan.[11] Alexander's team included:

- Richard H. Pleger, Associate Architect
- Parker-Zahnder Associates, Civil Engineer
- Forest K. Sampson, Electrical Engineer
- Irving E. Hattis, Mechanical Engineer
- Eckbo, Royston & Williams, Landscape Architects

Pleger, Parker-Zahnder Associates, and Garrett Eckbo, the Southern California-based partner of Eckbo, Royston & Williams, would stay with Alexander on OCC projects through the initial years.

Kime described Alexander's approach as:

> Mr. Alexander approached the problem in a unique manner. He prepared a map of the campus showing the location of all the buildings. This was pasted to a piece of plywood. In addition, he prepared small blocks in scale to the map of the several buildings that would be needed for a campus of fifteen hundred students in fifteen years. It is significant that Dr. Peterson was criticized in some quarters for the extravagant estimate.

[10] Alexander oral history, Tape number: VII, Side One, October 3, 1986.
[11] Board of Trustee meeting minutes, November 8, 1948.

> The buildings included by Dr. Peterson were based upon the courses to be housed as determined by the results of the community survey conducted by Dr. [James] Thornton [college vice president].
>
> A guiding factor was that of keeping the college "housed" while new buildings were under construction. To effect [sic] this, Mr. Alexander set up a seven year plan and a twenty year plan...A schedule of building based upon growth of the college and accumulation of funds was also worked out.[12]

A Faculty Building Committee and a Citizen's Building Committee formed to guide Alexander's efforts. Alexander presented the master plan to the Board of Trustees and the various committees in February 1949 as "Report on a Development Plan and A Construction Program for Orange Coast College," [13] (Figure 1B-3).

Figure 1B-3: Cover for OCC's original master plan, revised in 1951. Source: Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

To develop the master plan, Alexander took a systematic approach for each of the components. He evaluated the existing buildings and developed cost estimates for remodeling versus constructing new buildings. He found that only two buildings--the Administration Building and Gymnasium—were more cost-effective to remodel rather than build from scratch.

In Robert Evans Alexander papers, #3087, Division of Rare and Manuscript Collection, Cornell University Library. The school would continue the practice of the Faculty Building Committee reviewing and providing input on the initial building plans before the Board of Trustees approved them.

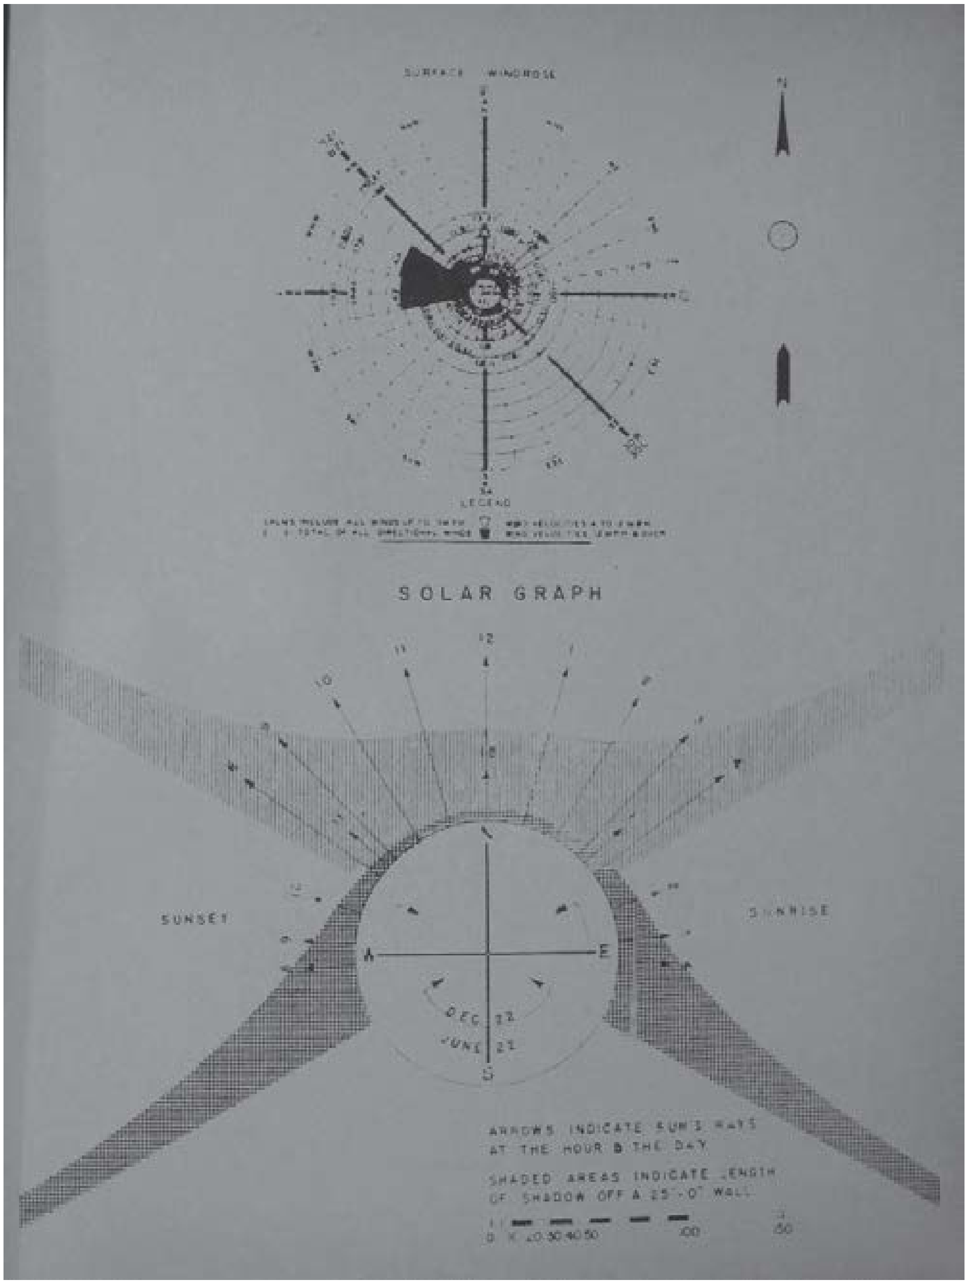

Figure 1B-4: Wind rose and solar graph from “Report on a Development Plan and a Construction Program for Orange Coast College.” Source: Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

For determining how much space the college would need, Alexander took into consideration its mission to provide occupational training, courses for university transfers, continuing education training, and “civic competency” and “personal efficiency.”[14] He also took into consideration the school’s curriculum and its seven divisions: languages and literature; social sciences; natural sciences and mathematics; technology; health and physical education; business education; and fine and applied arts. He analyzed the OCJCD’s enrollment forecast derived from the graduation

[14] Alexander, “Report on a Development Plan,” 6.

rates of local high schools: the administration calculated that the initial enrollment of 500 full-time students would expand to 1,500 within 15 years. In addition, Alexander gathered information on space requirements from the faculty.[15]

Finally, Alexander studied the site and its existing conditions for guidance on how to plan a new campus from the ground up. Given the surrounding transportation and access routes, he concluded that while Adams Boulevard would continue to serve students from the west, Fairview Road would become the major corridor for students coming from the OCJCD's main population centers to the south and east.[16] He looked at the soil and topography, identifying drainage as a potential issue for the flat site. He examined the site's sun and wind exposure and Army records indicating that strong winds primarily came from the west (Figure 1B-4).

Orange Coast College's 1949 Master Plan

With all this in mind, Alexander created a seven-year and twenty-year development plan for the college (Figure 1B-5). The immediate construction program assumed a student enrollment of 1,500 by 1964 and an ultimate enrollment of 2,400 by 1970.[17]

Based on his comparison of remodeling and new construction costs, Alexander recommended that the Administration Building and Gymnasium were the only buildings that were cost effective to remodel. The Chapel, which had been purchased outright from SAAAB, would also be retained and remodeled. According to Alexander's development plan, the central campus would be located in the southeast, closest to the OCJCD's population centers toward Costa Mesa and Newport Beach. The Administration Building, Gymnasium, and Chapel were also in this quadrant, along with two buildings that had already been remodeled.[18] The athletic fields and stadium would be placed in the northeast quadrant. The west part of campus with the best soil would be devoted to the agriculture program, with agricultural barns located at the north where the Army barracks in that area would be used for animal husbandry programs.

The seven-year plan recommended:

- Remodeling Administration, Gymnasium and Chapel buildings
- Construction of New Buildings in the following order:
    - Technology Building
    - Library Building
    - Agriculture Barns
    - Fine Arts Center
    - Agriculture Building
    - Student Center
    - Business Education
    - Speech Arts Building
    - Swimming Pool
    - Stadium
- Campus-wide utilities to be installed during the course of the seven years[19]

Division of Rare and Manuscript Collections, Cornell University Library.

Central Campus Organization

Following his analysis, Alexander concluded that each department needed general, multi-purpose classroom spaces as well as specialized spaces that could not be shared with other departments. However, things such as lockers, restrooms, offices, and conference spaces were common amenities that could be grouped or shared among departments.

Alexander proposed a modular linear building for classrooms 32 feet wide with movable partitions that could divide the space into offices (16 feet), storage and service facilities (24 or 32 feet) and classroom, laboratory, or drafting rooms at 40 feet sections.[20] Specialized spaces such as shops and studios were conceived as wings built at right angles to the classroom strips and separated by connecting corridors that would be covered walkways for circulation. The shops and studio wings would be top-lighted with skylights facing north or northeast and separated by courts 64-feet wide. Central lockers, restrooms, and offices were proposed. The classroom strips could be expanded in length as needed, and the specialized space wings could be extended in depth.[21]

[20] Alexander, "Report on a Development Plan," 22.
[21] Ibid., 22.

Alexander proposed placing the classroom buildings facing northeast in order to capture natural daylight from two directions and to provide shelter from the prevailing west winds.[22] With four-foot roof overhangs, the classrooms would not receive direct sunlight during normal school hours, nor would they receive direct west sun. The buildings that were not dependent on daylighting for instruction, such as the Student Center and the Speech Arts auditorium, would be placed in the north-south orientation.[23]

For the rest of the central campus, Alexander proposed:

- The Speech Arts Building containing the auditorium and the Administration Building should be related to the public and to large parking lots.
- The Administration Building with its student counseling services, should be related to the Student Center, which in turn should be related to the Gymnasium and Swimming Pool.
- All these facilities should be separated from the classroom areas.
- The Library should be related to the classroom areas and in direct line between the classroom areas and the Student Center.
- The Gymnasium should be between the classrooms and the Student Center, and should include a Swimming Pool with gym facilities for men and women.
- A series of covered walks was planned to connect all buildings in case of bad weather.
- Future dormitories should be close to the Student Center and between the Central Campus and the highway while future Maintenance Buildings should be near the Technology Shop areas.[24]

The diagonal orientation of the classroom area of the campus contrasted with the orthogonal orientation of the non-classroom buildings creating "an interesting and convenient pedestrian circulation pattern."[25]

Constructing the Seven-Year Plan

The Orange Coast Junior College District decided to fund the building program with a 29-cent tax override for seven years. Voter approved the $2.5 million, seven-year building program in the May 1949 election (Figure 1B-6). According to Alexander,

> [Basil Peterson] was a careful Mormon who abhorred being in debt and refused to go along with any thought of a bond issue (which was going into debt) and insisted on a tax-rate increase of ten cents a hundred or something like that, so that he could build one building a year… So every year for ten years I had a budget for a certain building and I was to spend as much of that budget as I could in building what I was building, but I was not to spend any more. This was quite a trick, especially when the Korean War came along and all of a sudden we had inflation. But over a period of years, we performed very well as far as our estimates versus the final costs were concerned.[26]

OCC barnacle

VOL. 1—NO. 15 MAY 25, 1949

Seven-year building program to begin at once after sweeping 2 to 1 ballot victory

Figure 1B-6: May 25, 1949 article in OCC's school newspaper about the passage of tax measure to fund OCC's initial campus development. Source: OCC Archives.

With funding in place, the college immediately set to work constructing Alexander's master plan. Rather than seek other architects to design the individual buildings, the OCJCD continued appointing Alexander as the architect for new buildings. Local Orange County-based architect Richard Pleger was the associate architect with Alexander. The first building completed was the Technology Building (1950) with its saw-tooth skylight ceiling and three shop wings. The second was the Library (1951, Bldg. 7 and part of Bldg. 8) and its distinctive clock tower, though the start of the Korean War and the resultant price increase and material shortage reduced the size and initial plans for the building and associated classrooms (Figure 1B-7).[27] Also planned and completed in 1950 and 1951 was the remodeling of the Gymnasium and Administration Building, construction of new agricultural barns, and installing campus-wide electricity and gas service as well as other ground improvements.[28] Eckbo, Royston and Williams prepared a campus landscape plan, including a Master Tree Plan in 1950.[29]

[27] "College Buildings: Space Analysis," *Progressive Architecture,* v.33 (February 1952): 69.
[28] Board of Trustees meeting minutes, November 14, 1949.

Figure 1B-7: Rendering of new library building (Bldg. 7) from January 9, 1951 *OCC Barnacle*. Source: OCC Archives.

The Arts and Crafts Building came next, also designed by Alexander and completed in 1952, as was the Feed Storage Unit in the agricultural area. At this point, Alexander's master plan and first three buildings (Technology Building, Library, and Feed Storage Unit) had been published in *Progressive Architecture's* 1952 issue on colleges (See Appendix). Alexander had also begun his collaboration with Richard Neutra by this time, and subsequent buildings were constructed with Neutra taking on the building design and Alexander continuing his planning and project management roles.[30] Except for at the original Library, Garret Eckbo provided the landscape design for the individual buildings in the seven-year plan.

The Student Center (Bldg. 86) and the Business Education Buildings (Bldgs. 12, 13, and 14) were completed in 1953. Business Education was the first in which Neutra and Alexander are credited as the architects (Figure 1B-8). Next came the Swimming Pool, completed in 1954 (Bldg. 93), which was relocated from adjacent to the Student Center (as specified in the master plan) to be near the newly remodeled Gymnasium, in order to share the locker facilities.[31] Similarly, the Stadium and Field House, completed in 1955 (Bldgs. 105 and 110), were moved closer to the center of campus and integrated next to the track rather than placed at the campus' far northeast

---

[30] It appears some initial construction and operation problems prompted the Board of Trustees to consider other architects for campus buildings. Alexander presented to the Board in March 1952 after the *Progressive Architecture* article and stated that Neutra would be interested in being considered for OCC building projects. The Board continued to hire Neutra and Alexander for the remaining buildings of the seven year plan with the desire that Neutra play a leading part in the development of plans. See Board of Trustee meeting minutes April 1951 and May 1952.
[31] Robert E. Alexander, "Memo RE: Planning a Campus," *College & University Business,* January 1959.

corner. Though initially planned for later in the building program, the Swimming Pool and Stadium were moved up in the construction schedule.

Figure 1B-8: Coverage for the opening of the Business Education complex in the *Long Beach Press Telegram* on January 13, 1954. Source: OCC Archives.

Also completed in 1955 was the Speech Arts Building (Bldg. 2) with its multipurpose and flexible auditorium that could open at its backstage to a planned outdoor amphitheater. A Music Building (Bldg. 4) was also part of the Speech Arts Building. A classroom addition (Bldg. 8 and 9) was added to the Library in 1955 as well.

In the end, the OCJCD decided that a new Science Building would be constructed rather than a new Agriculture Building; the old Science Building was relocated and remodeled for agricultural use.[32] The Science Building (Bldg. 35, 36, and 37) with its Planetarium (Bldg. 39) was completed in 1956 and 1957, completing the seven-year building plan (Figure 1B-9). The Planetarium was the first college planetarium in Southern California, and OCC received inquiries from several colleges from around the state, including Diablo Valley College, Yuba College, and Santa Rosa Junior College, asking about building a planetarium for their campuses (Figure 1B-10).[33]

[32] Board of Trustee meeting minutes, January 9, 1956.
[33] "OCC planetarium First of Its Kind," *Los Angeles Times*, October 14, 1956 and letters in OCC Archives for the Planetarium.

Figure 1B-9: Aerial of OCC in 1956 with the Science complex (Bldg. 35-39) under construction at left. Source: Floyd T. Waterman in OCC Archives.

As part of the Science Building, Neutra and Alexander approached artist Peterpaul Ott for an art object.[34] Members of the science department made suggestions for the art piece. The armillary sphere sculpture, placed at the east end of the Science Building is set on a concrete base depicting various scientific instruments from ancient times to the present.

Also in 1956, a Faculty Clubhouse (Bldg. 11) was constructed. Designed by Rodney Lauter, a former student at Orange Coast College, the Faculty House was drawn up by the drafting class, and constructed by the building trades class.[35]

By 1957, the seven-year building program came to an end. While additional buildings were needed for an enrollment that had already reached the anticipated 1,500 students, the immediacy of construction lessened. The seven-year tax increase ended, but the passage of the Murdy Bill gave the OCJCD authorization to use funds from out-of-district students toward capital improvements.[36] Neutra, Alexander, and Eckbo ended their role as designers of new buildings at Orange Coast College.

OCC PLANETARIUM FIRST OF ITS KIND
Los Angeles Times (1923-Current File); Oct 14, 1956;
ProQuest Historical Newspapers: Los Angeles Times
pg. K1

IMPORTANT GAIN—Orange Coast College's new dome-shaped auditorium, which will house the first college planetarium in the Southland, has created interest among art students. Instructor William O. Payne oversees the work of Darlene Longwell, center, and Carol Woodall. Planetarium is part of new center.

PROJECTOR AT WORK—Science Instructor James Pitton shows how the planetarium's $5000 projector will display the moon and many other planets on the dome ceiling. In addition to being used for classes, the planetarium will be utilized for community shows and special programs for high school students.

DECORATION—Sculptor Peter Paul Ott exhibits a model of a 15-foot armillary he will construct for the front of the main science building adjoining planetarium. The science center will be ready next spring.

OCC PLANETARIUM FIRST OF ITS KIND

COSTA MESA — The first college planetarium in Southern California has been constructed at Orange Coast College.

It is part of a new [illegible] science center which will be ready for classes during the spring semester, according to Dr. Basil Peterson, college president.

Instructor James Pitton explained that although a planetarium is important as a teaching device, few colleges have been able to afford the [illegible]

[illegible]

Lectures Planned

[illegible]

STAR GAZING—According to OCC football player Joe Coito there is nothing more interesting than the planetarium, especially when you study the phenomena of the heavens with a coed such as Nancy Cristy.

Figure 1B-10: Coverage of OCC's planetarium in the *Los Angeles Times*, October 14, 1956.

Recognition for OCC Initial Buildings

The buildings designed by Neutra and Alexander received widespread attention when they were constructed. *Progressive Architecture* devoted part of their February 1952 issue to college buildings, specifically junior college buildings, with Alexander's OCC master plan and initial buildings as one of two case studies (See Appendix). The section's foreword stated:

> The junior college is in one sense a "decapitation" of the full 4-year college, and in another, an upward growth from high school…Its functions therefore can be several—continuing cultural education not carried to the full collegiate level, pre-professional or even pre-academic training, or continual schools of perhaps a very specialized nature.
>
> If the college and university building has been neglected in the United States until very recently, the junior college—a phenomenon entirely of the 20th century—has suffered even more. In most cases, it has inherited structures either from a high school plant, or from a senior college. In their book, "Planning Secondary School Buildings" (Reinhold-1949), Engelhardt, Engelhardt, and Leggett state, "…it is quite the exception to find a junior college plant which was conceived, planned, and erected after a thorough-going survey which identified the particular purposes to be served in the local situation."
>
> The two Junior Colleges shown on the following pages, then, are exceptions to the rule. For one of them—the Little Rock Junior College (page 63-67)—was wholly planned from scratch. And, in the case of Orange Coast College (pages 68-79), while a few existing buildings were salvaged, the campus plan that was developed is essentially a brand new one. Determination of building needs, number of classrooms needed, of what type and size, etc. derived from findings drawn up in an extraordinary thorough-going, 106 page-survey—"Report on a Development Plan and a Construction Program"—prepared for the college board by Robert E. Alexander, the architect and his associates.[37]

Progressive Architecture again published a spread of the Neutra and Alexander buildings in 1955 with a special feature on the Speech Arts (theater) complex. The buildings were published in international journals such as *Bauen und Wohnen* and *Architektur und Wohnform, Innen-dekoration* in Germany and in *Kokusai-Kentiku* in Japan after their completion.

OCC was also featured in education journals as a case study for planning a new junior college. These publications included *College & University Business, American School and University,* and the proceedings from a summer institute focused on junior college planning, *New Dimensions in Junior College Planning*. Alexander and OCC's assistant superintendent William Kimes were invited to the 1958 summer institute at Stanford University's School Planning Laboratory along with others who had recent experience in planning for junior colleges.

[37] "College Buildings: Space Analysis," *Progressive Architecture,* February 1952, 61.

The buildings at OCC also received awards recognition, including

- 1951, Southern California Chapter AIA
  - Honorable Mention for the Technology Building
  - Special Citation for the Cattle Feeding Shed and Corrals
- 1954, National AIA Awards Program
  - Merit Award for Business Education Building
- 1954 Southern California Chapter AIA Honor Awards Program
  - Citations for Art Center and Student Center
- 1955 School Executive Competition
  - Honorable Mention for Business Education Building

Subsequent Development

Starting in 1957, Richard Pleger, who was associate architect and the local Orange County architect during the seven-year, Neutra and Alexander period, received subsequent commissions at OCC. His first was the Home Economics Building (now Bldgs. 71 and 72; Writer's Row and Journalism respectively), completed 1958. His firm, Pleger, Blurock, Hougan, and Ellerbroek, were responsible for several buildings through 1964:[38]

- Home Economics, 1958 (Writer's Row (Bldg. 71) and Journalism (Bldg. 72))
- Forum Lecture Hall, 1960 (Bldg. 81)
- Gymnasium, 1961 (Bldg. 91)
- Women's and Men's Locker Rooms, 1962 (Bldgs. 92 and 96)
- Data Processing Center, 1963 (Bldg. 73)
- Science Hall, 1964 (Bldg. 40)

Other projects include expanding the Technology Building, Student Center (Bldg. 86), as well as the Science Building (Bldg. 36) and Library (Bldg. 7) (Figure 1B-11 and Figure 1B-12).

Figure 1B-11: OCC course catalogue map (and legend with original building numbers), 1957-58. Source: OCC Archives.

Figure 1B-12: Course catalogue map of OCC, 1965-66. Source: OCC Archives.

[38] The firm was initially Pleger, Blurock and Hougan, became Pleger, Blurock, Hougan, and Ellerbroek around 1959, which became Blurock, Ellerbroek and Associates around 1962.

The Home Economics Building (Bldg. 71 and 72) partially continued the 45-degree angled classroom building layout set by Alexander, but one of its wings returns to an east-west orientation along a service road. The Forum (Bldg. 81) and Data Processing Center (Bldg. 73) followed as individual buildings, signaling a departure from the earlier planning principle of classroom building complexes connected by walkways.

In 1958, Richard Pleger and Dr. Peterson presented a revised master plan showing the location of a new Administration Building, additional classroom buildings, and a new Gymnasium.[39] However, Pleger, Blurock, Hougan, and Ellerbroek also designed sensitive additions to existing buildings, including to the Library (Bldg. 7) and the Science Building (Bldg. 36) that matched the existing architectural style. Between 1965 and 1967, Robert E. Alexander returned to the campus to design the Bookstore (Bldg. 83) and Liberal Arts classroom building (Bldg. 80 and 150) as well as an addition to the Music Building (Bldg. 4).

Figure 1B-13: Aerial view of OCC looking northwest with 1970s additions around the theater and between classroom complexes. Source: OCC Archive.

The next wave of development came in the 1970s with a number of new buildings and additions to existing buildings. William Blurock was then in partnership with Pleger and continued his association with OCC by designing subsequent buildings under William Blurock and Partners (Figure 1B-13). Between 1969 and 1979, the following buildings and additions were designed by William Blurock and Partners:

- New Library (Bldg. 87, Watson Hall), 1969
- Science Lecture Building (Bldg. 41), 1971

[39] Board of Trustee meeting minutes, February 24, 1958.

- Center for Applied Sciences (Bldg. 42, Lewis Center), 1971
- Environmental Horticulture complex, 1973
- New Administration (Bldg. 1), 1975
- New Music Building (Bldg. 3), 1975
- Fine Arts Lecture Hall (Bldg. 5), 1975
- Tutorial Center (Bldg. 10, Special Services), 1975
- Skills Center (Bldg. 47 and 48), 1975
- Literature and Language Building (Bldg. 70), 1976
- Chemistry Building (Bldg. 69), 1979

Significant additions also by William Blurock and Partners during this period include:

- Data Processing Center addition (Bldg. 73), 1970
- Drama Workshop wing to auditorium (Bldg. 2), 1975
- Expansion of Business Education's Bldg. 14, ca.1977

It appears few new buildings were constructed in the 1980s, though existing buildings received some upgrades, including air conditioning added to some Neutra and Alexander classroom buildings by placing the mechanical equipment on the covered walkway roofs. Additional renovations occurred in the 1990s, including to the renamed Robert B. Moore Theater (original Speech Arts Building auditorium, Bldg. 2) and to the Student Center (Bldg. 86) (Figure 1B-14 and Figure 1B-15) . In 1995, the Technology Building, the campus's first permanent building, was demolished. It was followed by the demolition of the Fine Arts Center around 2002 for the construction of a new Art Center complex by architect Steven Erlich Architects. Also in 2002, Measure C, a $372 million general obligation bond to fund facility improvements, passed in the OCJCD. Several new construction and renovation projects occurred in the subsequent years, including the new Library (Bldg. 182) constructed in 2008 on the cleared site of the demolished Technology Building.

OCC Construction Chronology

Note: Colors denote the buildings designed by specific architects.

- Yellow is Robert E. Alexander (1950-52)
- Orange is Neutra and Alexander (1953-1957)
- Pink is Pleger, Blurock, Hougan, and Ellerbroek (1958-1964)
- Blue is William Blurock and Partner (1969-1979)

Year	**Event**
1947:	Orange Coast Junior College District (OCJCD) founded. The OCJCD acquires 243 acres and 58 buildings from the former Santa Ana Army Air Base for its inaugural campus, Orange Coast Junior College.
1947:	Dr. Basil H. Peterson hired as OCJCD Supervisor. Agreement with State Division of Architecture and School House Planning and Fire Marshal for temporary occupancy of army buildings while they are upgraded to State standards or replaced.
1948:	Classes start at Orange Coast Junior College in September 1948 in existing army buildings. Board of Trustees hire Robert E. Alexander to ▫ Appraise existing structures on the Orange Coast College campus ▫ Give professional advice on improvements of said structures and on landscaping ▫ Prepare a statistical analysis of population size of the OCJCD now and in future ▫ Design and draft plot plan of proposed buildings ▫ Publicize artist's sketches of proposed buildings Consultants on Alexander's team include: ▫ Richard H. Pleger as Associate Architect "to obtain information locally at Architect's request and to provide general assistance;" ▫ Parker-Zahnder Associates, Civil Engineers ▫ Forster K. Sampson, Electrical and Illuminating Engineer ▫ Irving E. Hattis, Mechanical Engineer ▫ Eckbo, Royston & Williams, Landscape Architects

1949:	Board of Trustees approve master plan presented by Robert E. Alexander for;
	▫ Remodeling certain buildings
	    ▪ Administration, Gymnasium, Chapel
	▫ Seven-year building program for replacement buildings
	    ▪ Technology Building
	    ▪ Library
	    ▪ Agriculture Barns and Buildings
	    ▪ Fine Arts Center

    - Student Center
    - Business Education Building
    - Speech Arts Building
    - Swimming Pool
    - Stadium
    - Campus-wide utilities and grounds improvement
- Longer term building program to replace all existing buildings

Voters approve ballot measure for a 29-cent tax increase for seven years to build OCC.

1950: Technology Building, first permanent new building, opens. Architect: Robert E. Alexander.

1951: The Library Building (Bldg. 7 and east end of Bldg. 8) completed and dedicated on September 19, 1951. Architect: Robert E. Alexander.

1952: Arts Center Building completed. Architect: Robert E. Alexander.

1953: Student Center (Bldg. 86) completed. Architect: Neutra and Alexander.

Construction completed for Business Education (Bldg. 12, 13, and 14) Architects: Neutra and Alexander

1954: Swimming Pool (Bldg. 93) completed. Architects: Neutra and Alexander

1955: Speech Arts Building (Bldg. 2 and 4) completed. Architects: Neutra and Alexander

Stadium and Field House (Bldg. 105 and 110) completed. Architects: Neutra and Alexander

“Library Addition” classroom buildings (Bldg. 8 and 9) completed. Architect: Neutra and Alexander.

1956-57: Science Building (Bldg. 35, 36, 37, and 39) completed. Architects: Neutra and Alexander. Peterpaul Ott’s armillary sphere sculpture installed at the east end of Building 35.

1957: Faculty House completed. Designed and constructed by OCC faculty and students.

1958: Home Economics Building (Bldg. 71 and 72) completed. Architects: Pleger, Blurock, Hougan, and Ellerbroek.

1960: Forum Lecture Hall (Bldg. 81) completed. Architects: Pleger, Blurock, Hougan, and Ellerbroek.

	Additions to Science Building (Bldg. 36) and Library (Bldg. 7) completed by Pleger, Blurock, Hougan, and Ellerbroek.
1961:	New Gymnasium (Bldg. 91) completed. Architects: Pleger, Blurock, Hougan, and Ellerbroek.
1962:	Women's and Men's Locker Rooms (Bldg. 92 and 96) completed. Architects: Pleger, Blurock, Hougan, and Ellerbroek.
1963:	Data Processing Center (Bldg. 73) completed. Architects: Pleger, Blurock, Hougan, and Ellerbroek.
1964:	Science Hall (Bldg. 40) completed. Architects: Pleger, Blurock, Hougan, and Ellerbroek.
1965:	Bookstore (Bldg. 83), Liberal Arts Building (Bldg. 80 and 150), and addition to Music Building (Bldg. 4) completed. Architect: Robert E. Alexander F.A.I.A. and Associates.
1969:	New Library (Bldg. 87, Watson Hall) constructed. Architect: William Blurock and Partners.
1970:	Science Lecture Building (Bldg. 41), Center for Applied Sciences (Bldg. 42, Lewis Center), and addition to Data Processing Center (Bldg. 73) completed. Architect: William Blurock and Partners. Orange Coast Junior College District changes its name to Coast Community College District (CCCD) in recognition of its second school, Golden West Community College, which was established in 1965.
1972:	Environmental Horticulture complex completed. Architect: William Blurock and Partners.
1975-77:	Several new buildings completed. Architect: William Blurock and Partners ▪ New Administration (Bldg. 1) ▪ New Music Building (Bldg. 3) ▪ Fine Arts Lecture Hall (Bldg. 5) ▪ Tutorial Center (Bldg. 10, Special Services) ▪ Skills Center (Bldgs. 47 and 48) ▪ Literature and Language Building (Bldg. 70) Significant additions during this period include ▪ Drama Workshop wing to auditorium (Bldg. 2) ▪ Expansion of Business Education's Building 14
1979:	Chemistry Building (Bldg. 69) completed. Architect: William Blurock and Partners

1986: HVAC equipment and ducts added to covered walkways at

- Business Education (Bldg. 8 and 9)
- Science Building (Bldg. 35 and 36)

ca. 1992: Student Center (Bldg. 86) significantly expanded and altered.

Robert B. Moore Theater (Bldg. 2) auditorium interior renovated.

1994: Planetarium (Bldg. 39) received L-shaped wing to form interior courtyard. The rectangular wing north of the planetarium/classroom entrance may also have been added at this time. Architect: The Hill Partnership Inc.

1995: Technology Building, first permanent building on campus, demolished

ca. 1999: Seismic upgrades occurred at

- Building 7's north façades on both wings
- Building 12 and 13's north façades

ca.2002: Original Fine Arts Center demolished and new Arts Center Complex completed. Architect: Steven Erlich Architects

Measure C passes, a $372 million general obligation bond to fund facility improvements in the CCCD

2006: Renovations occurred to

- Student Success Center (Bldg. 7)
- Robert B. Moore Theater (Bldg. 2): New Scene Shop wing added.

2008: New Library (Bldg. 182) completed. Architect: tBP/Architecture Inc. (successor firm of the William Blurock Partnership). From Measure C funding.

2011: Renovations occurred to

- Business Education (Bldgs. 8 and 9)
- Math Wings (Bldgs. 35 and 36)
- Reprographics Building (Bldg. 37)

2012: Renovations occurred to Music Building (Bldg. 4)

Below are the chronologies of development for each contributor grouped by the original complex construction. The complexes within the core of the Orange Coast College Historic District are included first and arranged in chronological order of completion. The discontiguous features, the Swimming Pool complex (Bldg. 93) and the Stadium and Field House (Bldgs. 105 & 110) follow, with the landscape features at the end. The clock tower, attached to Building 7, is included with Building 7 while the armillary sphere sculpture is discussed with the Math and Planetarium complex (Bldgs. 35-39).

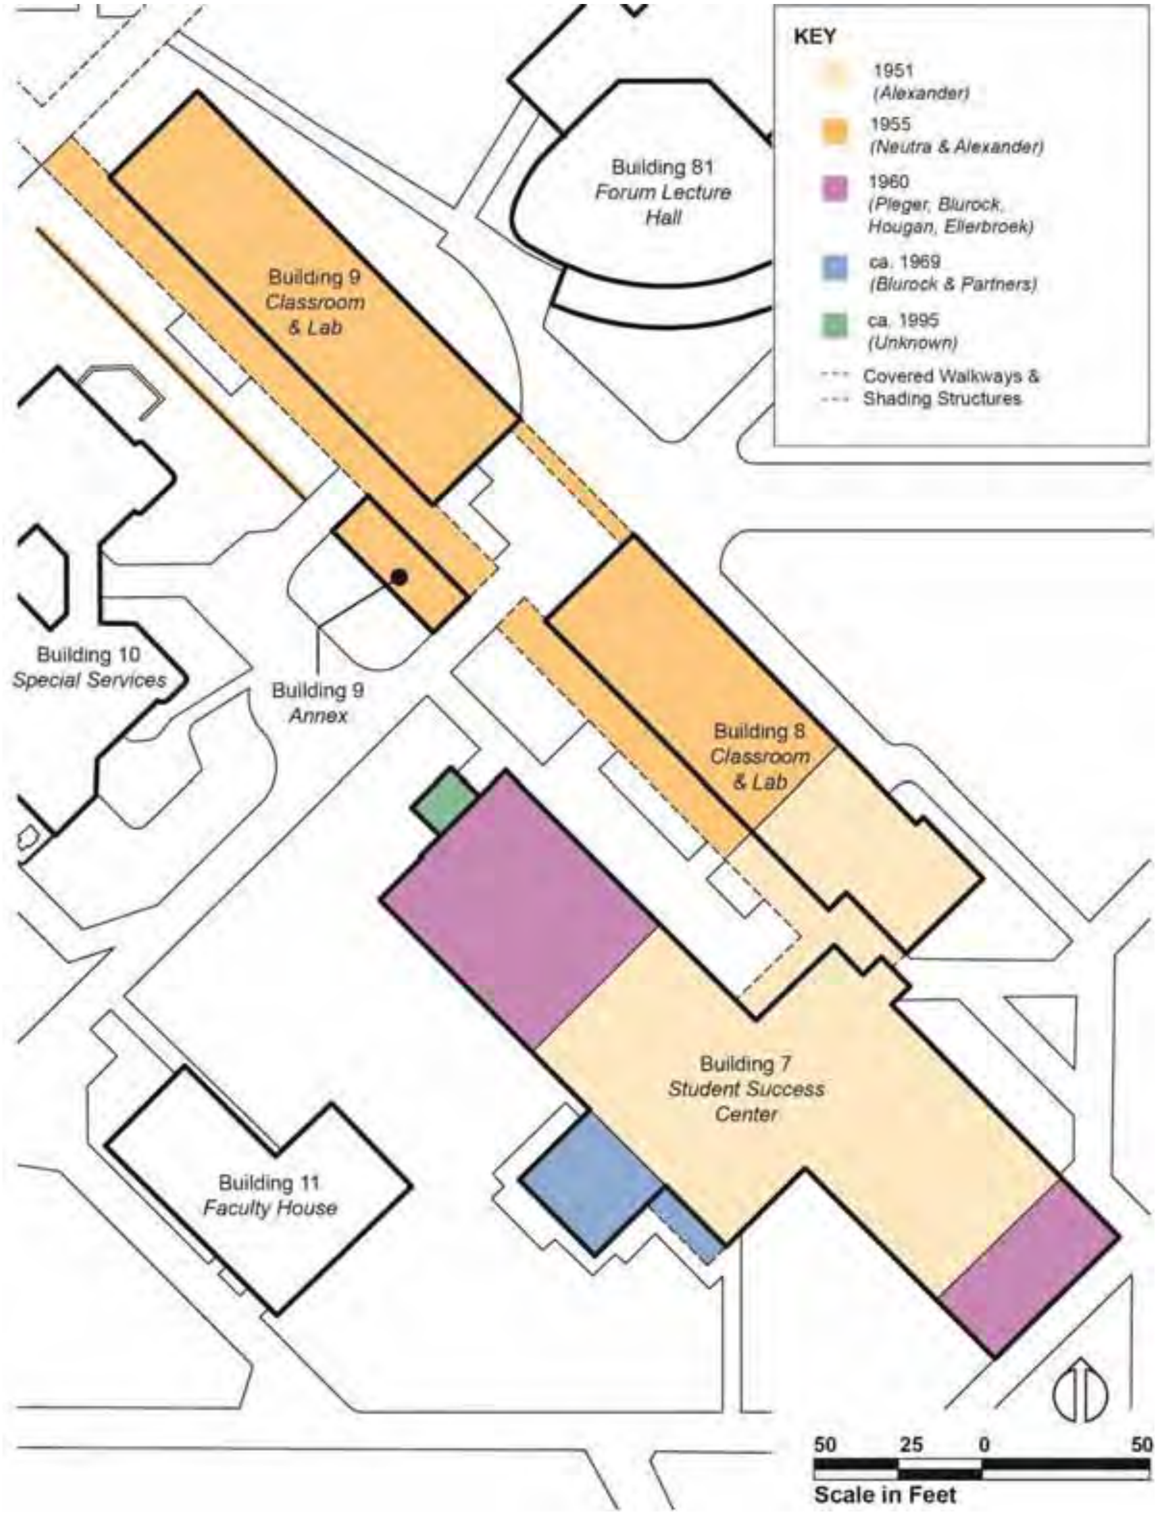

Figure 1B-16: Complex chronology plan of Student Success Center (Bldg. 7) and Classroom and Lab Buildings (Bldgs. 8 & 9).

Buildings 7, 8, 9 | Student Success Center and Classroom & Labs Complex

Built originally as the campus library with a classroom wing, the original parts of Buildings 7 and 8 were the second permanent building to be constructed on the Orange Coast College campus and are the oldest remaining buildings on campus.

Figure 1B-17: Facing west towards Building 7 (left-hand side) and Building 8 (right-hand side). Glazed doors in position at the east entrance to the walkway between the two buildings. Date unknown. Source: Manu. Box 74 folder 621-622, Garrett Eckbo Collection, Environmental Design Archives, University of California, Berkeley.

Designed by Robert E. Alexander and opened in 1951, Building 7 housed the school library with a reference room in the west wing and the reading room and book stacks in the east wing. Both large open areas had bi-lateral daylighting with clerestory windows facing south and a window wall facing north. Since the two wings had a shed roof along the north half and a lower flat roof along the south, the clerestory windows were at the center of the spaces with lower ceiling areas along the south end. A lounge with a fireplace was at the juncture where the two wings intersected.

Building 8 contained an office zone and two classrooms and was connected to Building 7 across a partially enclosed vestibule. The vestibule's east end had glazed doors and sidelites to separate it from Building 8's covered walkway.

Figure 1B-18: Building 7 (right) and Building 8 (left) prior to the first additions and looking east. Glazed doors in position at the east entrance to the vestibule/walkway between the two buildings. Exact date unknown, pre-1955. Source: Box 110, Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

Figure 1B-19: Fireplace originally in Building 7 when it was constructed as the Library. Date unknown. Source: Box 110, Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

In 1955, Building 8 was extended with the addition of two classrooms and service spaces. At the same time, Building 9 was constructed as part of the Library Addition project. Designed by the collaboration of Richard Neutra and Robert E. Alexander, the addition and new building closely emulated the material, style, fenestration pattern, and design of the 1951 portions. The new plans called for the tilt-up concrete wall at the west end of Building 8 to be removed and reused as the end wall of the addition was completed. The Restroom Building (Bldg. 9b), brick screen wall, and landscaped patio were added in 1955 as well, and the south covered walkway was extended.

Figure 1B-20: Facing south towards Building 7 (left-hand side) and Building 8 (right-hand side) prior to the first additions. Date unknown, pre-1955. Source: Box 99, Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

Figure 1B-21: Facing south towards Building 7 (left-hand side) and Buildings 8 & 9 (right-hand side). Date unknown. Source: Box 99, Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

Building 7 received additions in 1959 by Pleger, Blurock, Hougan and Ellerbroek. The west wing (Reference Room) was extended significantly, while a small addition at the east wing (Reading Room) extended the building toward the east. The additions' architectural features match the existing building. The tilt-up concrete end walls were removed and reset as exterior walls of the additions.

In 1969, Buildings 7, 8, and 9 were renamed as Counseling and Admissions. The Reference Room in Building 7's west wing was reused for student registration while the Reading Room and book stack area in the east wing was reconfigured for student counseling with perimeter offices. Air conditioning was also added to Building 7, which resulted in the mechanical room addition on the south façade and likely the large fascia with scuppers across the south façade to conceal new rooftop equipment and ducts. The rooftop equipment added on the lower roof along the south end of both wings also likely led to the removal and concealment of the aluminum louvers and clerestory windows in the original shed roof.

Around 1986, heating, ventilation, and air conditioning (HVAC) equipment and ducts were added on top of the covered walkways of Buildings 8 and 9, along with other buildings on campus. It is likely the clerestory windows along the buildings' south façades were painted over around this time. The standing seam roof on the south side of Building 7 appears to have been added around 1998.

Seismic retrofitting in 1999 added masonry shear walls to the north façades of both wings at Building 7. The brick walls typically replaced two bays of windows at the east and west ends.

In 2000, disabled access stalls were added to the restrooms in Buildings 7 and 8. The window near the south secondary entrance of Building 7 was infilled for a single-stall accessible bathroom. In 2006, Building 7 underwent additional alterations, including adaptively reusing the east wing as three classrooms and inserting new doors on the north elevation.

Building 7, 8, & 9 Construction Chronology

Year

1951: The Library Building (Bldg. 7 and east end of Bldg. 8) was completed and dedicated on September 19, 1951. Architect was Robert E. Alexander.

1955: "Classrooms in the "Library Addition" (Bldgs. 8 and 9) began to be used on September 12. Architects: Richard Neutra and Robert E. Alexander.

1960: The two additions to the Library (Bldg. 7) were completed.
3,085 square foot expansion of the Reference Room (west wing).
1,128 square foot expansion of the Reading Room/book stacks (east wing)
Architects were Pleger, Blurock, Hougan, and Ellerbroek.

ca. 1969: Buildings 7, 8, 9 renamed as Counseling and Admissions. As part of the change in use, air conditioning was added to Building 7, now called Able Counseling Admissions/Records. This includes adding the mechanical room on the south façade and may have included addition of the large fascia with scuppers across the south façade and covering over of south-facing clerestory windows.

1986: HVAC equipment and ducts added to Buildings 8 and 9's covered walkway.

1998: Roof of Building 7 replaced (per staff notes).

ca. 1999: Seismic Retrofit work began in 1999 on the Student Success Center (Bldg. 7). Architect and Engineer involved was The Bentley Company: Internal and external shear walls added.

2000: Restrooms in Buildings 7 and 8 upgraded with disable access stalls. The window near the south secondary entrance was infilled for a single-stall accessible bathroom.

2006: Alterations and tenant improvements to the Student Success Center (Bldg. 7) designed by LPA Inc.

Alterations undertaken at unknown times:

- Building 7
  - Sliding glass door on plan south façade replaced by window.
  - Small stucco addition to the west end (pre-1999).
  - Canted metal shed roof replaced former flat roof along south side.
  - Removal of fireplace after 1970.

- Building 8
  - Addition of doors to north façade after 1997.
  - Change of office configuration for mechanical room in office wing.
  - Change into current classroom configuration.
- Landscaping
  - Benches/features in landscaped patio removed from between Buildings 8 and 9.

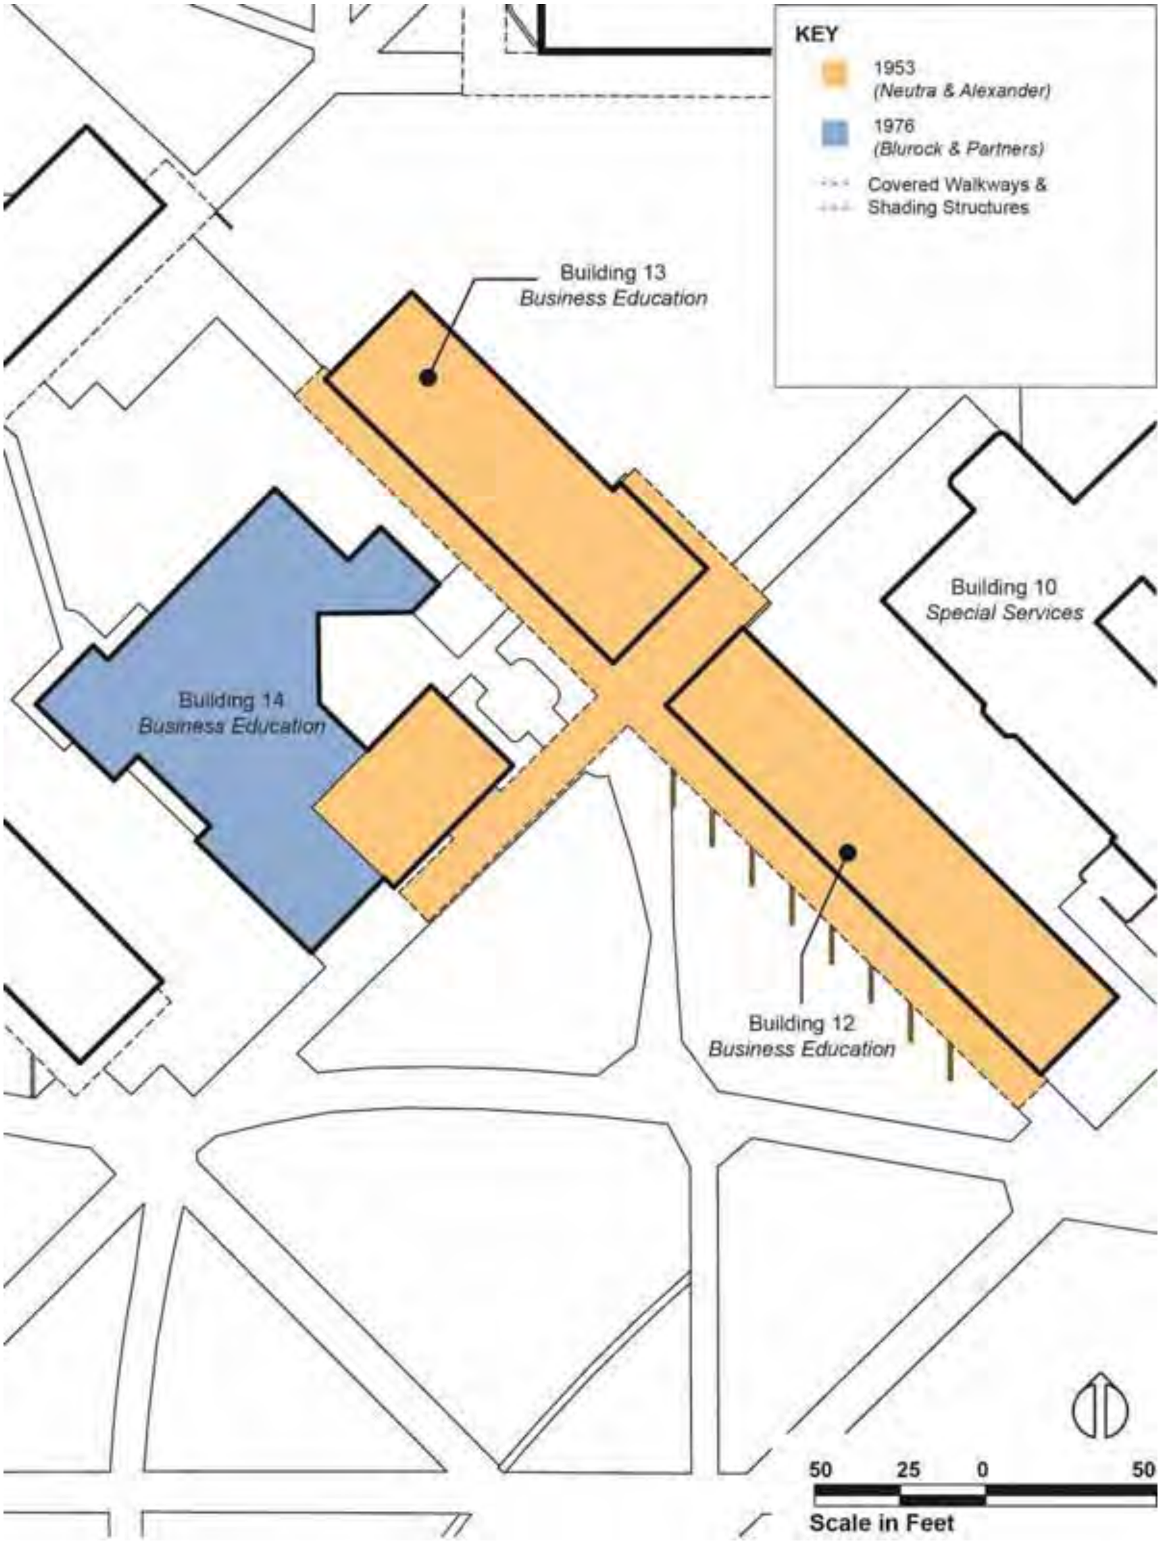

Figure 1B-22: Complex chronology plan of Business Education complex (Bldgs. 12, 13 & 14).

Buildings 12, 13, 14 | Business Education Complex

When completed in 1953, the Business Education complex consisted of Building 12, Building 13 and a smaller Building 14 than what exists today. Designed by Neutra and Alexander, the buildings were designed for teaching various aspects of business support, including typing and stenography, accounting, use of business machines, and merchandising. Building 14 housed merchandising classes and had a display window along its west façade for students to practice window dressing. The north façade at the east end of Building 13 projects slightly; this area housed faculty offices. A landscaped courtyard separated Buildings 13 and 14.

Figure 1B-23: Facing south through the breezeway between Buildings 12 (left) and 13 (right) towards Building 14's projecting display window visible. Date unknown. Source: Box 4, Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

Building 14 was significantly altered and expanded around 1977. The original brick walls at the north, south, and east façades were retained and incorporated into the expanded building. The display window was covered with wood sliding and the interior reconfigured.

Seismic retrofitting completed in 1999 added plywood shear walls with brick cladding at the north façades of Buildings 12 and 13 (Figure 1B-24). Where inserted, the new walls typically replaced four bays of windows. Two small brick shear walls were also added to the south façade, where new tube columns where also added. HVAC equipment and ducts were added on top of the covered walkways of Buildings 12 and 13, possibly around 1986 when similar equipment was added to other buildings on campus.

Figure 1B-24: Breezeway between Buildings 12 (left) and 13 (right) with shear walls added on north façade.

Buildings 12 and 13 underwent refurbishment in 2011 which removed chalk boards, tack boards, and some built-in cabinetry. New whiteboards, carpeting, and lighting were installed. A workroom in Building 13 was expanded, though wood veneer built-in cabinetry and a set of pocket doors remained.

Figure 1B-25: Classroom 106, Building 13.Several original features remain including wood veneer paneling below window and cabinetry at rear office. Date unknown. Source: Box 110, Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

Figure 1B-26: Classroom 106, Building 13. The clerestory windows have been painted or covered, original lighting fixtures replaced and the internal wall partition has been altered.

Buildings 12, 13, & 14 Construction Chronology

<u>Year</u>

1953:	Construction completed for Business Education, a T-shaped complex of three buildings. Buildings 12 and 13 are the main classroom buildings and Building 14 is a small Merchandizing Lab Unit. Architects: Richard Neutra and Robert E. Alexander.
ca. 1977:	Significant additions to Building 14. Three original brick walls remain and were incorporated into the expanded building. Architects: William Blurock & Partners.
1999:	Seismic upgrade with shear walls at the Building 12 and 13's north façades and tube columns at their south façades.
2000:	Restrooms in Building 13 upgraded with disable access stalls.
2011:	Refurbishment of Building 12 and 13 with new carpeting and other finishes.

Alterations undertaken at unknown times:

- Building 13
  - Reconfiguration of faculty office space into open classroom.

- Buildings 12 & 13
  - HVAC added on top of the covered walkways.

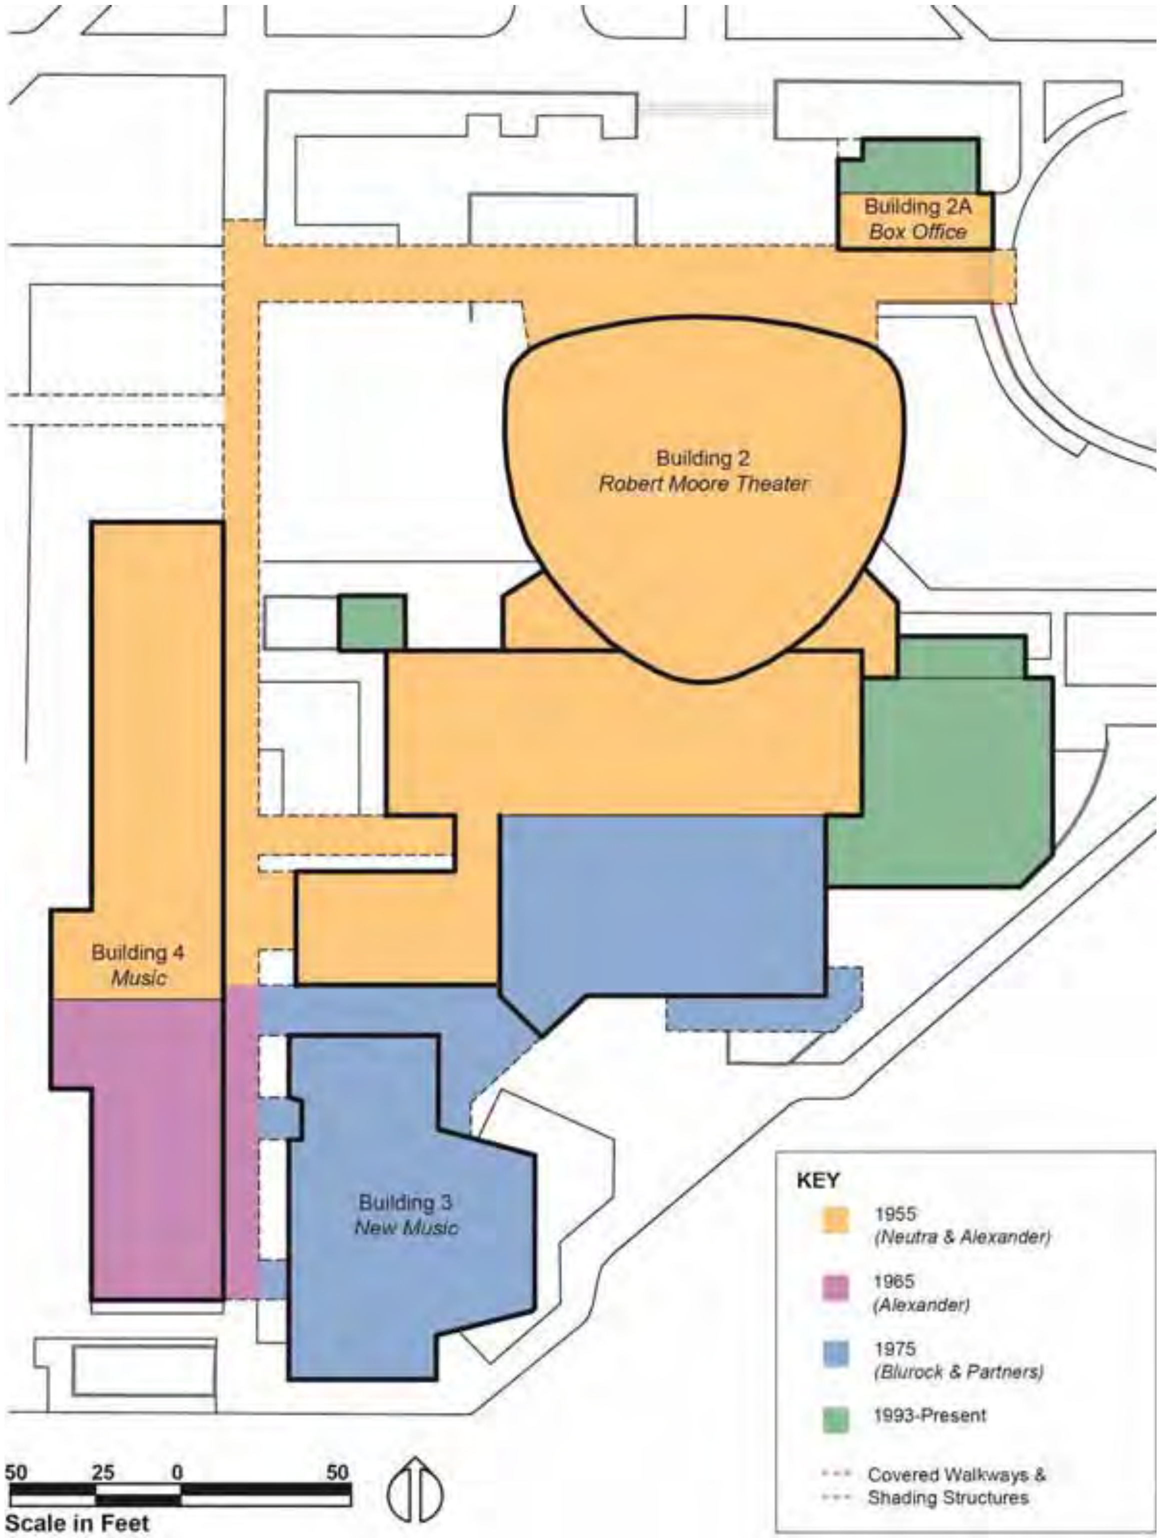

Figure 1B-27: Complex chronology plan of Robert Moore Theater (Bldg. 2), the New Music Building (Bldg. 3), and the Music Building (Bldg. 4).

Buildings 2, 4 | Theater and Music Complex

Completed in 1955, the Speech Arts Building comprised the 1,200-seat Auditorium and Stage House (Bldg. 2) and an adjacent Music Building (Bldg. 4) which housed choral and band practice rooms as well as office, instrument storage, and individual practice rooms. The original complex included a stand-alone Ticket Office and Restroom Building (Bldg. 2A) as well as an L-shaped wing toward the rear of Building 2 at the southwest corner for costume storage, dressing rooms, and restrooms that could also be accessed from the exterior.

Figure 1B-28: North façade of the Speech Arts Building (Bldg. 2). Date unknown. Julius Shulman Photography Archive. Copyright The J. Paul Getty Trust. The Getty Research Institute, Los Angeles. ID no.: gri_2004_r_10_b0080_f011_1952_51.

Designed by Neutra and Alexander for flexibility with Dr. Vern Knudsen from UCLA as the acoustical consultant, the auditorium's

> 45-foot stage has side entrances, movable seats, and independent heating, so that it may be used as a Little Theater for 250 persons. In addition, the 40-foot proscenium may be expanded to 80 feet merely by opening the motor-driven doors on each side of the arch. Automatically operated doors at the rear of the stage open to a natural amphitheater suitable for pageants and for graduation ceremonies.[41]

The stage could be transformed into various arrangements through the use of movable doors, curtains, stage platforms, side stages, and revolving scenery platforms. The auditorium had an

---

[41] "Dedication: Auditorium and Music Building, Orange Coast College," March 30, 1955 program, in Orange Coast College Archives, Theater folders.

orchestra pit, organ loft, and projection booth. An exterior lobby was created at the front patio with a covered walkway and opaque glass screens that allowed transparency and open access from three directions: the circular car drop-off area to the east, the pedestrian approach from campus to the north, and the covered walkway path from the Music Building to the west.

The Music Building originally had two large classrooms, one for choral and one for band. Both had tiered platforms with acoustically absorbent wall materials in the form of perforated wood paneling that curved into the ceiling. The building also had a brick wing with individual practice rooms and offices. Original plans show wood doors with wood paneling surrounds and two areas with windows.

In 1965, an addition designed by Robert E. Alexander, F.A.I.A. & Associates extended the Music Building southward. The addition mirrored the original massing with a brick wing abutting the original brick wing, one large, non-tiered classroom space located at the south end, and a series of offices, practice rooms, and storage rooms between. The addition matched the original building's architectural features, but did not connect internally between the brick walls.

The firm of William Blurock and Partners designed a Drama Workshop addition to the Auditorium (Bldg. 2) as well as a New Music Building (Bldg. 3) in the complex in 1975. The Drama Workshop addition housed a Drama Lab with movable boxes to create various floor levels and configurations. The north wall of the Drama Lab was the 40-ft by 20-ft sliding doors that opened from the rear of the auditorium stage. It is not clear if the sliding doors remain or if the opening has been infilled. The Drama Workshop wing also included an intimate Small Lab. Both labs had their own entrance from the exterior through a triangular entry vestibule at the southwest corner.

The New Music Building (Bldg. 3) is positioned to the south of the Drama Workshop. This new stand-alone building is clad in brick as well as split-faced concrete masonry blocks that matched the exterior materials of the other buildings designed by William Blurock and Partners at the OCC campus during the 1970s. Building 3 and the Drama Workshop addition on Building 2 share a new covered walkway and a paved entry plaza from the parking lot to the Drama Workshop's triangular entry vestibule.

The auditorium was renamed the Robert B. Moore Theater in 1982 to honor the retirement of Dr. Moore, after an 18-year tenure as OCC's president.

In 1992 the Robert B. Moore Theater underwent renovation. The Hill Partnership, Inc. added a geometric plaster motif to the auditorium interior that also closed off the side stages of the theater. The orchestra pit was covered and a new low wall was built to extend the stage over the pit. The seats were refurbished, new flooring was added, and disable access seating spaces were provided. The auditorium's seating capacity decreased from 1,200 to 944 seats. A new utility enclosure with an electrical room and transformer was added to the west of the theater. A new disabled access ramp was added to the east near the circular drop-off area.

The large Scene Shop wing was added to the east of the Stage House in 2006. The stand-alone ticket office (Bldg. 2A) also received an addition to its north side that relocated the men's restroom and added an office. The L-shaped wing at Building 2's southwest corner was reconfigured on the interior to create a larger costume workshop. Interior access to the restrooms in this wing was eliminated.

The two Music Buildings (Bldg. 4 and Bldg.3) underwent renovations in 2012. At Building 4, the doors on the east façade were removed and replaced with contemporary hollow-metal doors within framing that required patching of the façade's stucco. Other openings on the façade, including windows, some doors, and fire hose cabinets, were also infilled with stucco. Similarly, vents on the west façade were also resized and infilled where needed.

On the interior, Building 4's original band room (Room 102) had its original curved wood-panel finishes removed from the back wall and ceiling, the new flooring added to the tiered platforms, and fixed seating installed. A new vestibule and door opening was added to the room's south side and the original door opening was infilled. The original choral room (Room 101) underwent fewer modifications during the renovation; the original wood panel curved wall and ceiling remain (Figure 1B-29 and Figure 1B-30). The choral room received new flooring as well as additional acoustical paneling on the side walls. The original wedge-shaped lab and storage between the band and choral rooms was reconfigured to provide a disabled access ramp to the top tier level at the back of both rooms, accessed via new doors installed at the rear of the rooms.

Figure 1B-29: Room 101 interior in Building 4. Date unknown. Source: Box 110, Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

Figure 1B-30: Room 101 interior in Building 4.

At the south end of Building 4, an area of offices, storage rooms, and lab spaces were combined to create a large piano lab. Offices in one of the brick wings were also reconfigured, though most of the individual practice rooms remained. Most rooms received new interior finishes as part of the renovation. The building's mechanical system was also upgraded and current equipment placed on the roof of the covered walkways.

Building 2 & 4 Construction Chronology

Year

1955: Speech Arts Building (Bldg. 2) completed. Included are

- 1,200 seat auditorium
- 104ft wide by 45ft deep stage with flexibility for various configurations and where the rear wall slid open to an outdoor amphitheater
- Exterior lobby at the patio with stand-alone ticket office building (Bldg. 2A)
- Music Building (Bldg. 4) with two large tiered classrooms and a brick wing with individual practice rooms
- Covered walkways creating the outdoor lobby and connecting the buildings together.

1965: Robert E. Alexander returned to OCC campus to design a number of new buildings, including an addition to the Music Building (Bldg. 4). The addition expanded the building to the south and mirrored the original with a brick wing abutting but not connecting to the original's south brick wing. Not as long as the original section, the addition housed one new classroom and several practice, storage, and office rooms. The covered walkway on the east elevation was extended the full length of the building addition.

1975: Drama Workshop addition by William Blurock and Partners added to the Auditorium's rear (south) façade (Bldg. 2) where the outdoor amphitheater was located. A stand-alone New Music Building (Bldg. 3) was also added to the complex around this time.

1982 The auditorium (Bldg. 2) was renamed the Robert B. Moore Theater in honor of Dr. Robert B. Moore, the retiring president of OCC.

1989: Moore Auditorium (Bldg. 2) alteration plans by Dahl Taylor & Associates. Scope of work is unknown.

1993: The Robert B. Moore Theater (Bldg. 2) under goes renovation with plans by the Hill Partnership Inc. The renovation focused on interior finishes, work around the stage, and providing handicap access. The auditorium seating changed from 1,200 seats to 944 seats. Some structural, mechanical, and electrical work was also done.

2006: Cosmetic renovation of interior finishes to the auditorium (Bldg. 2)

Additions/Alterations to Building 2: addition and interior alterations to stand-alone ticket office (Bldg. 2b), large addition to east, interior alterations to brick offshoot on west side to form costume workshop and removal of interior restrooms

2012: Both Music Buildings (Bldgs. 3 and 4) undergo modernization. For Building 4, this includes new doors and door frames along the east façade and stucco infill of disused openings. All windows on the east façade were infilled while vents on the west façade are made smaller. The stucco wall finish is patched where needed.

On the interior, one original room (Room 101) retains its original curving wood panel wall and ceiling, while in Room 102, it is replaced with a new system. The wedge-shaped storage space between Rooms 101 and 102 receives a disabled access ramp to serve the top level of both rooms. A large Piano Lab is created from reconfiguring several smaller spaces toward the south end of the building.

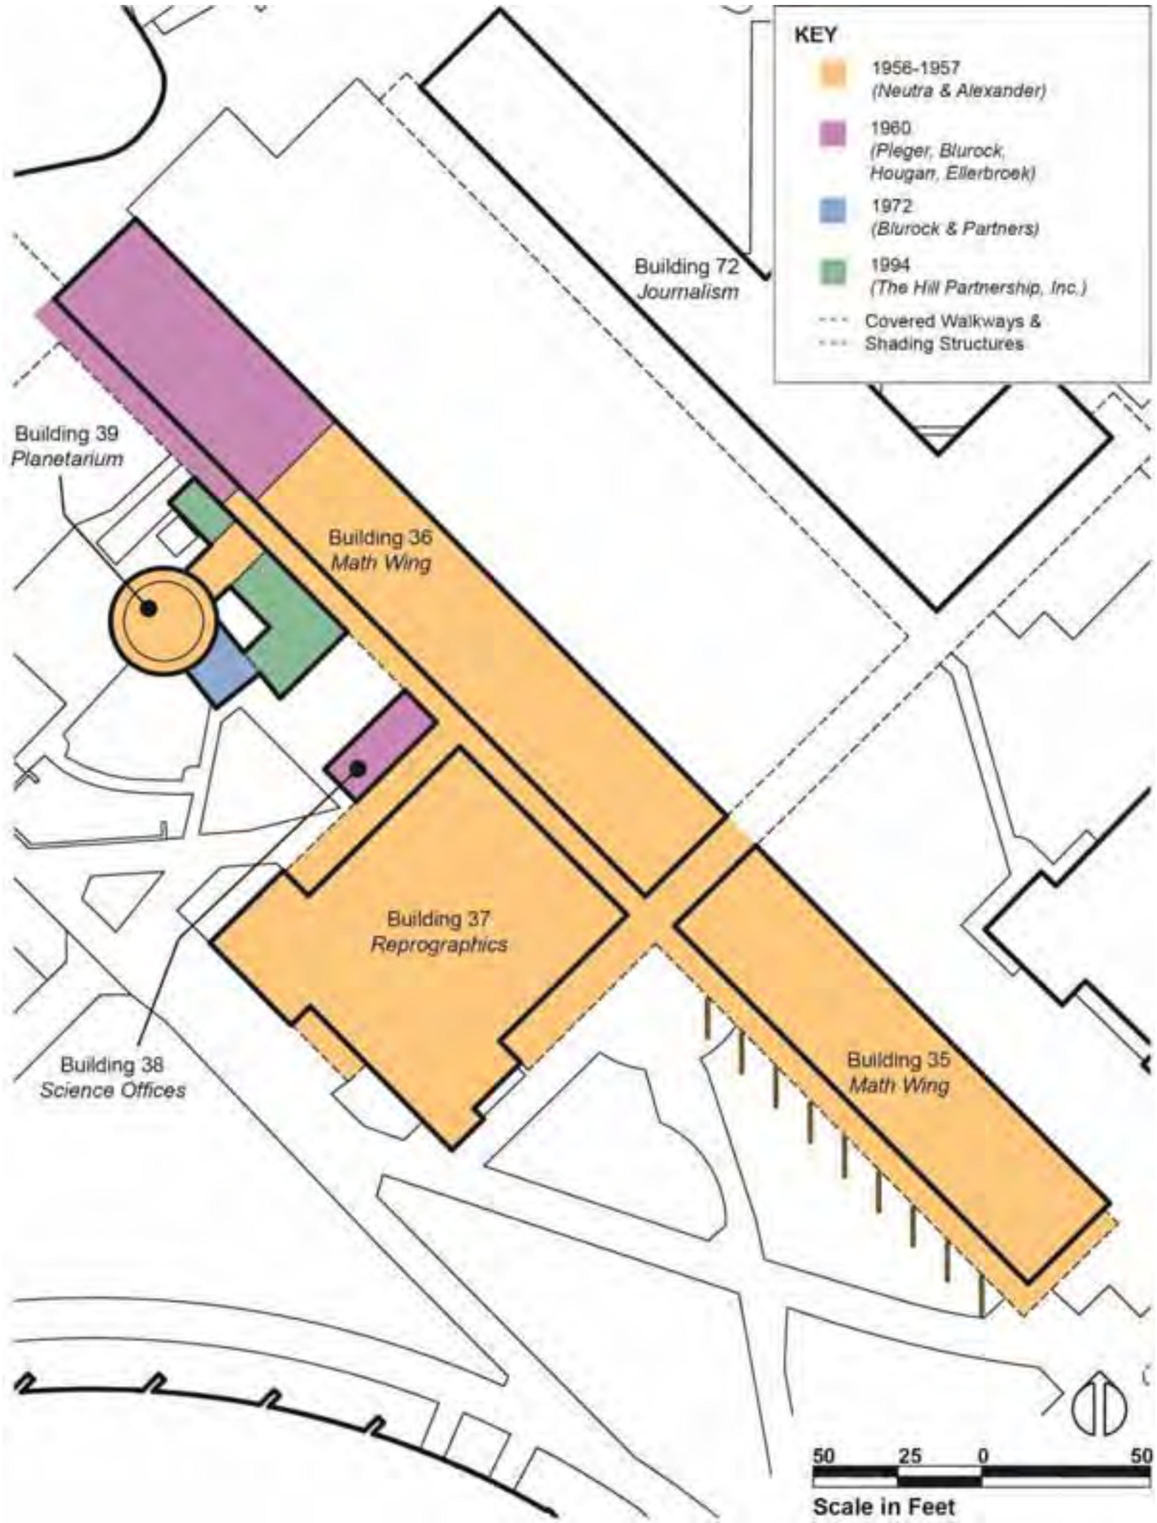

Figure 1B-31: Complex Chronology Plan of Math Wings (Bldg. 35 and 36), Reprographics (Bldg. 37), Science Offices (Bldg. 38), and Planetarium (Bldg. 39).

Buildings 35, 36, 37, 39 | Math and Planetarium Complex

Designed by Richard Neutra and Robert E. Alexander, the Science Building was completed in 1956-57 and originally contained four buildings:

- Classroom Wing (Bldg. 35) with three classrooms and one lab
- Laboratory Wing (Bldg. 36) with three labs and one lecture room with a raked floor
- Chemistry Wing (Bldg. 37) with three chemistry labs, one lecture room with a raked floor and an exterior stair to roof deck
- Planetarium (Bldg. 39) with the domed planetarium, a greenhouse, work room, and animal room

Figure 1B-32: 1957 photograph of Science Building facing west, showing Building 35 (right) and Building 37 (left). Julius Shulman Photography Archive. Copyright The J. Paul Getty Trust. The Getty Research Institute, Los Angeles. ID no.: gri_2004_r_10_b0082_f012_13_2453_01.

The clerestory windows along the south façades of Buildings 35 and 36 originally had aluminum louvers, as did the clerestories in the breezeway. The plywood door surrounds and accents on Buildings 35, 36, and 37 were not painted originally. Buildings 36 and 37 each had a raked lecture classroom with exterior stair access; the stair at Building 37 remains and stepped up while the Building 36 stair behind the stand-alone brick wall in the covered walkway stepped down and has been removed.

Building 39 originally included the domed planetarium and an L-shaped extension with a greenhouse, work room, and animal room along the covered walkway. A wedge-shaped reflecting pool was located south of the Planetarium, along with an arc of trees following the Planetarium's circular shape. A wood fence with offset boards connected the L-shaped extension of the Planetarium to the covered walkway along Building 37's west façade, but has since been razed. The covered walkway extended west beyond Building 36 and featured a wood-slat screen along the north edge.

The armillary sculpture - designed by Laguna Beach-based sculptor, Peterpaul Ott - was installed at the south end of the Science Building complex following the completion of the Science Building in 1957. It is located on a square concrete pad set adjacent to the walkway leading west along the south façade of Building 35. According to the historic photographs, there was an L-shaped half-wall that was set at the southeast corner of the square concrete pad. These have since been removed, but an L-shaped concrete patch remains.

In 1960, the firm Pleger, Blurock, Hougan, and Ellerbroek designed an addition to the west end of Building 36. The 2,800 sq. ft. addition contained two additional lab/classroom spaces separated by a shared prep/storage space. The addition matched Building 36's architectural features but had two stucco bays in place of windows on the north façade. The covered walkway along the building's south façade was also extended at this time and the wood-slat screen wall was removed.

William Blurock and Partners added the east volume attached to the domed planetarium/ classroom (Bldg. 39) in 1972. It appears that the new L-shaped wing was built on the footprint of the original greenhouse/work room/animal room wing of Building 39 around 1994 to create the internal courtyard; the addition west of the planetarium's main entry at the covered walkway also appears to date from 1994.

Building 37, which was originally the chemistry wing, was repurposed for new uses around 1980 when a new chemistry building was constructed on campus. It became the Reprographics Building around 1986 or 1987. Also around this time, its existing HVAC system was renovated and new duct work and vents installed. Similarly, HVAC equipment was added to the covered walkway along the south façade of Buildings 35 and 36 around 1986, when some of the jalousie clerestory windows were removed.

Buildings 35, 36 and 37 underwent renovation/refurbishment in 2011. The work included removing the raked floor in Building 36's classroom and infilling the stair opening behind the stand-alone brick wall. It also included removing original wood built-in casework as well as glued-on acoustical tile at the ceilings, where they remained. New acoustical ceiling tiles were installed; one room has a suspended ceiling. Chalkboards and tack boards were also removed and replaced with modern dry erase boards and new lighting was installed. One prep/storage room in Building 35 retains its original wood casework and other wood veneer features. Vinyl windows on Building 35's east end wing may have been installed at this time.

Building 35, 36, 37, 38, & 39 Construction Chronology

Year

1956: Buildings substantially complete; occupancy started in late 1956.

1957: Peterpaul Ott armillary sphere sculpture installed at the east end of Building 35.

The Science Building was officially dedicated on April 2, 1957. It consisted of four wings:
Classroom Wing (Bldg. 35) with three classrooms and one lab
Laboratory Wing (Bldg. 36) with three labs and one lecture room with a raked floor
Chemistry Wing (Bldg. 37) with three chemistry labs and one lecture room with a raked floor and an exterior stair to roof deck
Planetarium (Bldg. 39) with the domed planetarium, a greenhouse, work room, and animal room

1960: Pleger, Blurock, Hougan, and Ellerbroek designed an addition with two lab classrooms sharing a storage/prep area to the west end of Building 36. The addition matched Building 36's architectural features but added two stucco areas on the north façade. The covered walkway along the building's south façade was also extended.

Building 38, which housed three offices was added.

The Science Building additions were constructed at the same time as the Library (Bldg. 7) additions, also by Pleger, Blurock, Hougan, and Ellerbroek.

1972: Addition of attached east volume to the domed planetarium/classroom in Building 39. Designed by William Blurock & Partners.

1976: Interior alterations to classroom/lab in original part of Building 36 for additional duct, vent hoods and exhausts for student laboratory tables. Architect: William Blurock and Partners.

1980 Building 37, originally the chemistry wing, was renamed and reused for the IMC AV Center following the completion of a new chemistry building. The building was renamed Technical Services / College Materials in 1984.

1986: HVAC equipment and ducts added to Building 35 and 36's covered walkway. Engineered by F.T. Andrews.

1987: Removed existing HVAC ducts and vents and installed new system in the newly-renamed Reprographics Building (Bldg. 37). Architect: Dahl Taylor & Associates.

1994: Planetarium (Bldg. 39) L-shaped wing added to form interior courtyard. The rectangular wing north of the domed planetarium entrance may also have been added at this time. Architect: The Hill Partnership Inc.

1996: Alteration of the southwest corner classroom at Building 37 to form a Computer Classroom. Architect: The Bentley Company.

1997: Buildings 36 and 37 underwent a pendant lighting and suspended ceiling systems seismic retrofit along with other buildings on campus. Architects: Robbins Jorgensen Christopher Architects.

2011: Buildings 35, 36 and 37 underwent renovation/refurbishment. The work included removing the raked floor in the Building 36 classroom and infilling the stair opening behind the stand-alone brick wall. It also included removing original wood built-in casework and lab stations as well as glued-on acoustical tile at the ceilings where they remained. New acoustical tile ceilings installed including one room with a suspended ceiling. Chalkboards and tack boards were also removed and replaced with modern dry erase boards. New lighting installed. One prep/storage room in Building 35 retains original wood built-ins.

Vinyl windows on Building 35's east end wing may have been installed at this time. Architects: Dougherty.

Alterations undertaken at unknown times:

- Buildings 35 & 36
  - Removal of louvers over south façade and breezeway clerestory windows.
  - Additional classroom doors added at the south façade of Building 35.
- Building 37
  - Removal of south entrance and installation of rollup metal doors
  - Flattening of raked classroom floor
- Landscape
  - The reflecting pool located to the south of the Planetarium (Bldg. 39) was infilled with concrete at an unknown date, however the form is still visible
  - An arc of trees located to the south of the Planetarium were removed

Figure 1B-33: Historic photograph of the east façade of Building 37 showing exposed plywood with clear finish (low resolution image). ca. 1957. Source: Box 99, Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

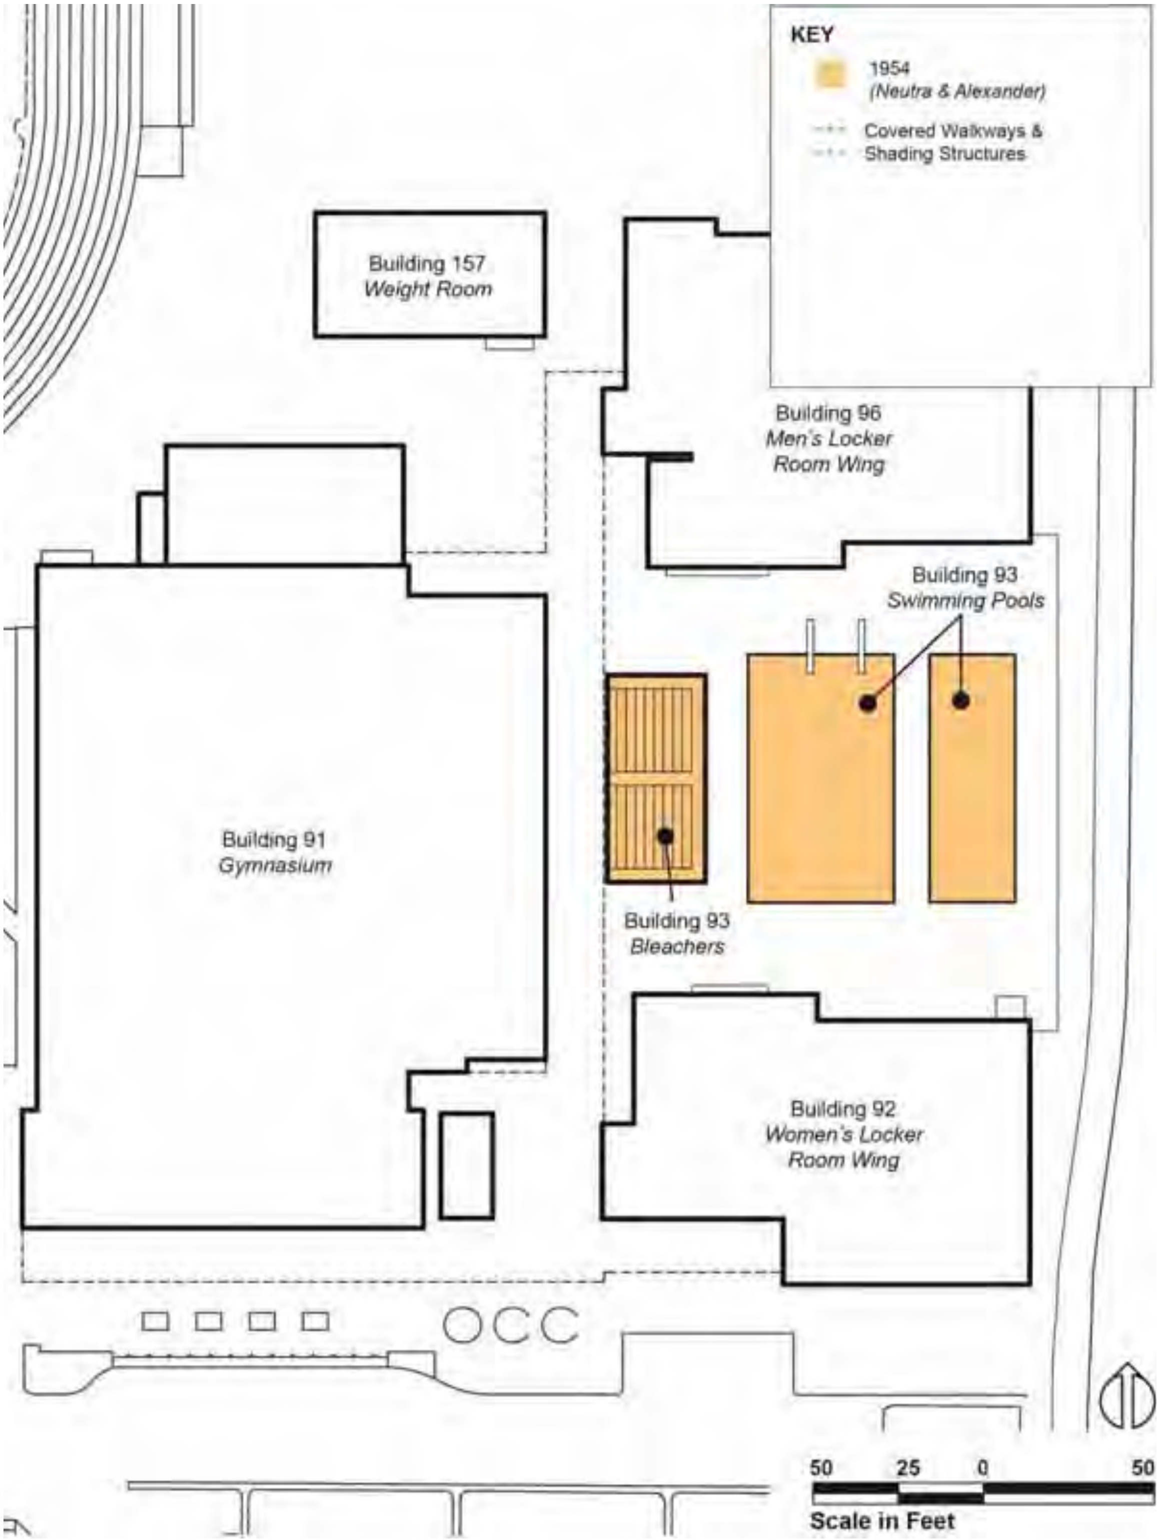

Figure 1B-39: Complex chronology of Swimming Pool complex (Bldg. 93)

Buildings 93 | Swimming Pool Complex

The Swimming Pool complex was completed in 1954. The complex included:

- Deep Pool that ranged from six to twelve feet deep (75' L x 44'W)
- Shallow Pool that was four to four and a half feet deep (75' L x 24'W)
- Originally three diving boards, including one sculptural concrete diving platform
- Concrete bleachers (seat 350)

The pools were poured concrete tubs with gunite finish. They had tiled curbs and gutters. Bordering the pools were 12ft wide concrete decks with radiant heating system built within.

Figure 1B-40: View of the swimming pools from the bleachers facing northeast. The handball courts in the background have been demolished and the Men's Locker Room (Bldg. 96) constructed in its place. Date unknown. Julius Shulman Photography Archive. Copyright The J. Paul Getty Trust. The Getty Research Institute, Los Angeles. ID no.: gri_2004_r_10_b0080_f001_1745_33.

In 1961-62, the new Gymnasium (Bldg. 91), Men's Locker Room (Bldg. 96), and Women's Locker Room (Bldg. 92) were constructed surrounding the pool. The Men's and Women's Locker Rooms provided the pool with changing rooms and opened directly to the pool deck. New decking without radiant heat was added between the existing pool paving and the new locker rooms. A new wood-framed stucco wall was constructed to enclose the space below the concrete bleachers, which housed the pool equipment. The new wall attached to the new covered walkway running between the bleachers and the new gymnasium.

The pools and pool deck were remodeled around 1992. The original concrete pool deck with embedded radiant heating was removed and the deck drainage system improved. The original tiled gutters around the pool were removed and deeper gutters installed. The new concrete pool deck extended over the new pool gutters.

Figure 1B-41: View of the swimming pool from the bleachers facing northeast. The Men's Locker Room (Bldg. 96) is in the background.

The pool basins had fiberglass coatings removed and were refinished with white plaster. New black ceramic tiles were added to mark lanes, depth, and ends; new lighting, pool steps, and grab rails were installed. Racing platforms were placed at the south end. The original concrete diving platforms were replaced and pool equipment was upgraded.

Features installed at unknown dates include the reinforced brick fence wall with integrated concrete benches along the east boundary and the tile around the drinking fountains at the low concrete masonry unit (CMU) wall between the pool and bleachers.

Building 93 | Swimming Pool Complex Construction Chronology

Year

1954: The Swimming Pool was completed and dedicated.

1961-62: New Gymnasium (Bldg. 91), Men's Locker Room (Bldg. 96), and Women's Locker Room (Bldg. 92) constructed around the Swimming Pool. A new wood-framed stucco wall was constructed to enclose the space below the concrete bleacher and attach to the new covered walkway running between the bleachers and the new Gymnasium.

1992 The pool and pool deck underwent remodeling.

- Original concrete pool deck with embedded radiant heating removed
- New concrete pool deck that extends over the pool gutters installed.
- Deeper gutters replaced the original gutters around each pool
- Fiberglass coatings that had been added to the pool interiors were removed and the pool refinished with white plaster.
- Black ceramic tile added for lane, depth, and end markers
- New lighting, pool steps, and grab rails added
- New diving stands replaced original concrete diving platforms and racing platforms added
- Pool equipment upgraded

Unknown date:

- Construction of reinforced brick wall with integrated concrete benches along the east boundary.
- Tile added around the drinking fountains at the low CMU wall between the pool and bleachers.

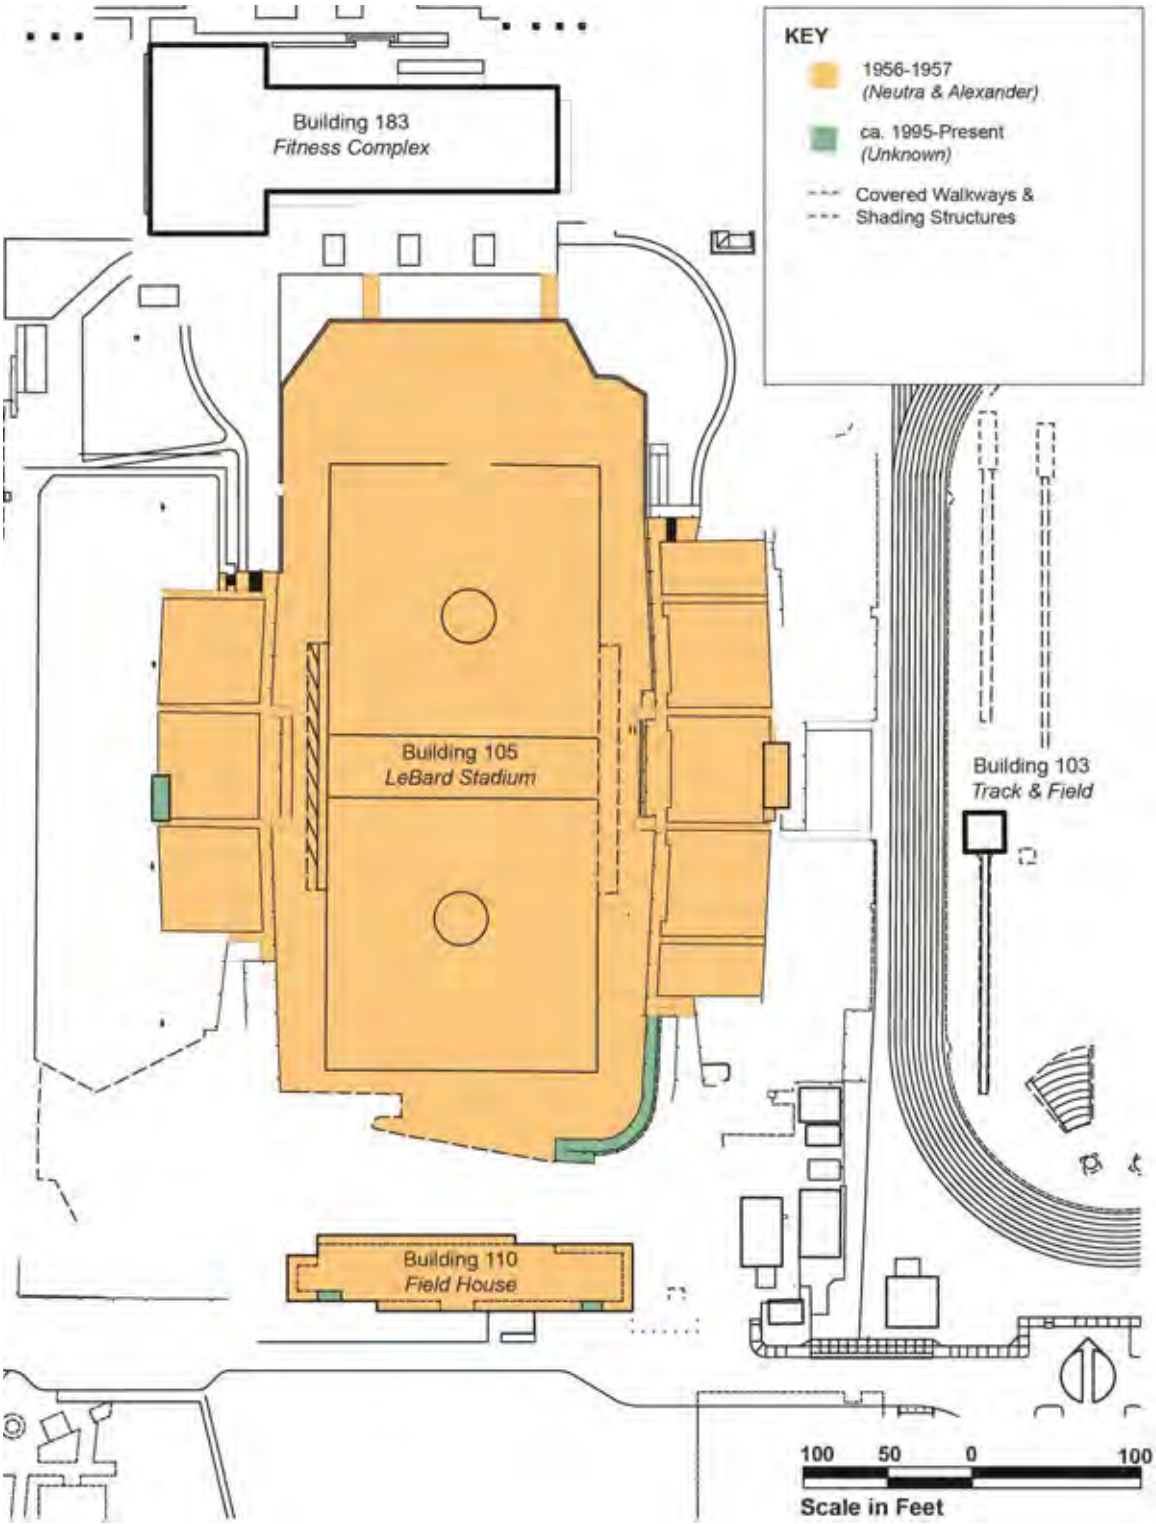

Figure 1B-42: Complex chronology of Swimming Pool (Bldg. 93).

Buildings 105 & 110 | Stadium and Field House

In 1955, the new 7,500-seat football stadium was completed. It was designed with the playing field 10ft below existing ground level. The excavated dirt was piled in berms upon which the concrete bleachers were constructed. A pump system was installed for drainage.

The Stadium's concrete bleachers ran along the east and west sides of the field. The bleacher sections were slightly curved to give a bowl effect and provide better sight lines. The east bleachers were for the home team while the west bleachers were for the visiting team. A press box was at the top of the east rim and was equipped for broadcasting. A platform on top of the box was for TV cameras. An electric score board and field lighting were also included.

Figure 1B-43: Close up of stadium seating (Bldg. 110). Date unknown. Julius Shulman Photography Archive. Copyright The J. Paul Getty Trust. The Getty Research Institute, Los Angeles. ID no.: gri_2004_r_10_b0080_f011_1952_47.

The Field House was constructed south of the Stadium. It housed showers and dressing rooms for the home and visiting teams. It also included public restrooms and concession booths.

In 1967, the Stadium was renamed LeBard Stadium in honor of Harry R. LeBard, a member of the Orange Coast Junior College District board from 1947 until his death in 1965.

The Stadium lighting was replaced around 1977. Accessibility upgrades for parking, seating and access to the east bleachers at the Stadium, and upgrades to the Field House occurred in 1997.

In 2004, D.S.E. Architecture prepared plans for remodeling the Stadium. The work included:
- Accessible seating and access ramp at the west bleachers
- Accessible bathrooms in the Field House
- Railing replaced at the top of the east press box.
- The addition of stairs to the east press box.

In 2007, new doors were added to the south façade of the Field House along with one window. Another window was also added to the north façade.

Buildings 105 & 110 | Stadium and Field House Construction Chronology

Year	
1955:	New 7,500-seat football stadium completed and dedicated.
1967:	Stadium renamed LeBard Stadium in honor of Harry R. LeBard, a member of the Orange Coast Junior College District board from 1947 until his death in1965.
1977:	Stadium lighting system was upgraded.
1997:	Accessibility upgrades for parking, seating and ramp at the east bleachers. Upgrades to the Field House.
2004:	Plans for the Athletic Stadium Remodel
2007:	New windows and doors added to the Field House.

Landscape

Landscape architect Garrett Eckbo categorized his work at Orange Coast College with his other public buildings. His approach for such projects was "to develop a really thorough and clear integration of building and site in terms of space, form, material, and function."[42] Trees and shrubs were placed to form strong spatial relationships with buildings. Analysis of the building uses helped to make decisions about how people looked in and out of the buildings.

Eckbo was part of the initial team who worked with Robert E. Alexander on the 1949 master plan for Orange Coast College (OCC) (Figure 1B-44). The plan's circulation pattern showed straight axial pathways at the site's east side to connect the general use buildings: Theater, Administration, Student Center, and toward the athletic fields. Another major east-west route was present and extended from the Theater to the Technology Building. In the classroom core set at a 45-degree angle, the pathways are diagonal and run perpendicular to and through the buildings. Secondary axes create a diamond pattern across open spaces between buildings. Near the Library (Bldg. 7), where the two pathway systems meet, Eckbo planned a central open space.

Following the master plan, Eckbo prepared a Master Tree Plan in 1950. His approach assumed permanence of the campus so the selected trees would have the opportunity to mature. The form and arrangement of the tree patterns was to assist in producing outdoor spaces of "maximum usability and pleasurable experience for students and faculty."[43] Wind directions and the formal relationships of buildings, circulation lines, and spaces with specific functions, such as sports fields and the parking areas, dictated the proposed tree patterns. A ring of perimeter trees set along the periphery of the campus was intended to define the campus against the surrounding open country.

Within the campus, tree plantings were to be arranged to serve as windbreaks, form circulation patterns, create visual interest and perspective, serve as unifying elements upon maturity, and fashion interrelationships with the buildings and their architecture. Eckbo intended to utilize trees of three different height categories, each serving a certain function: windbreaks (tallest), the shelter pattern (medium), and visual interest and screening (shortest). The initial OCC plan intended the windbreak plantings to be placed along the north side of the classroom buildings to help buffer winds on the open spaces between buildings. The shelter plants were to serve as buffers between the walkways and buildings, creating a vertical and natural transition between the hardscape and the building. The shelter plantings were interspersed within the landscape, often in open spaces and in a more sporadic pattern, intended to create informal moments.

[42] Eckbo, *Landscape for Living*, 183
[43] Eckbo, Royston, and Williams, "Master Tree Plan for Orange Coast College, Costa Mesa, California," transmitted to Robert E. Alexander on September 6, 1950. In Box 107, Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

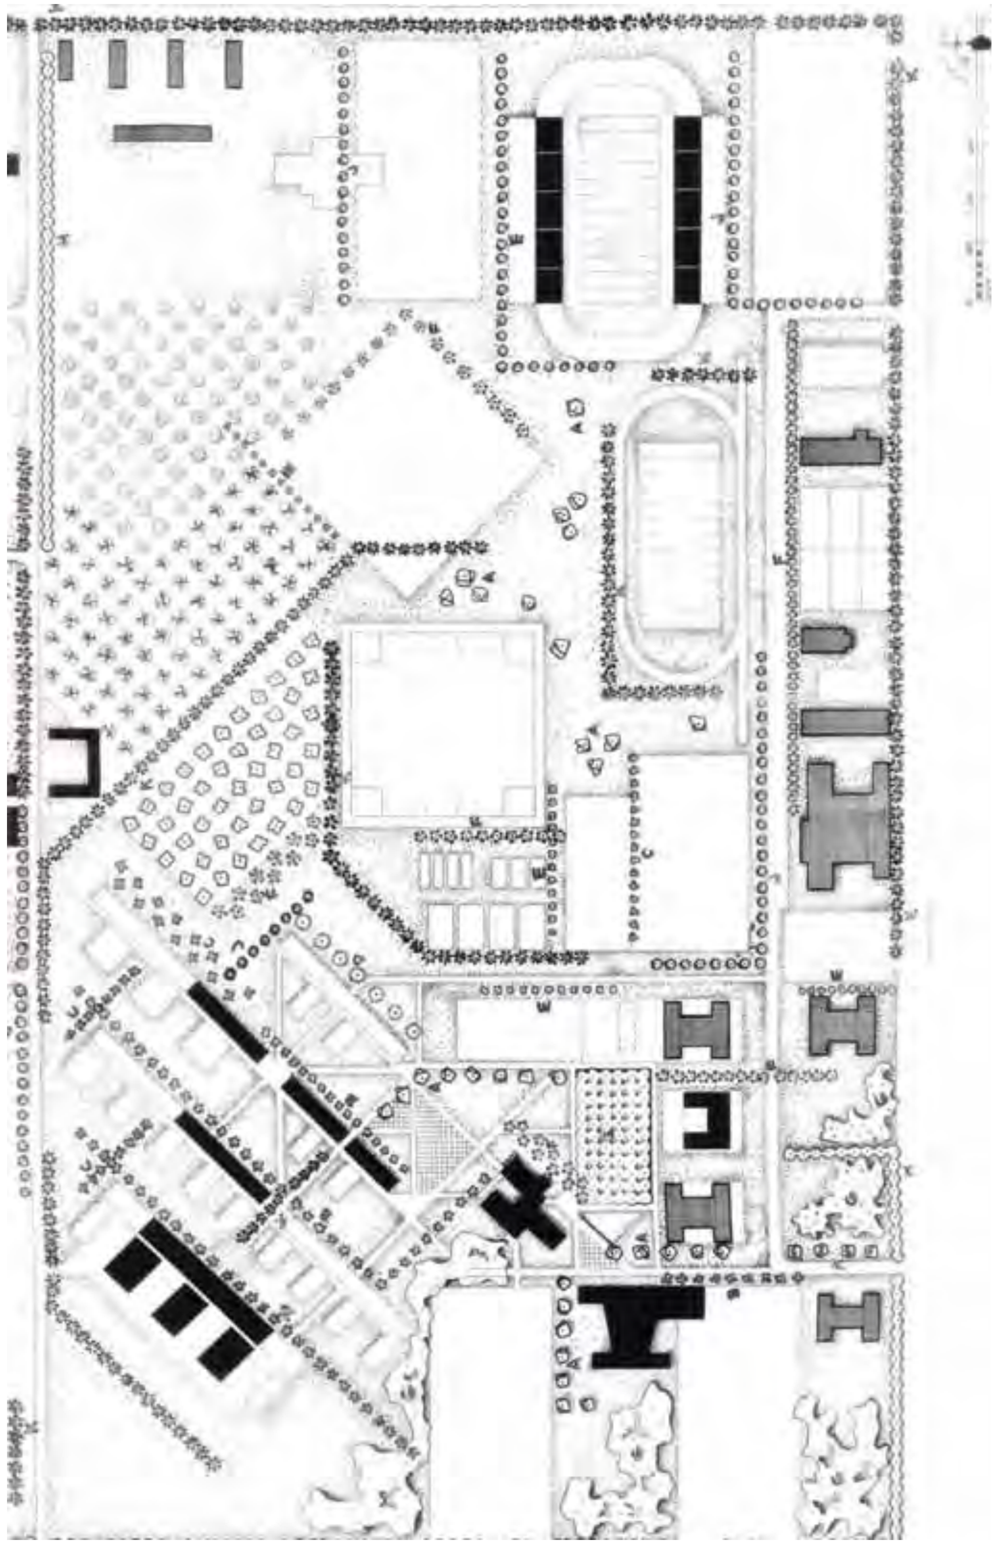

Figure 1B-44: Original master plan for Orange Coast College. Source: Garrett Eckbo Collection, Environmental Design Archives, University of California, Berkeley.

Although the landscape master plan by Eckbo and Alexander was approved by the Board of Trustees, the overall plan underwent substantial changes as the buildings were constructed. Each building complex was given an individual landscape design at the time of construction, which further impacted the overall plan. For example, the windbreaks were planted along the north side of the Technology Building but by the time Business Education (Bldgs. 12-14) was under construction in 1952, the tall windbreak trees were no longer being used for any campus buildings.

An additional walkway along the east-west axis was added to extend from the Student Center building through the breezeways of the Business Education complex and ultimately to the Science Building complex. This axis intersected the classroom area's diagonal circulation pattern at an angle to create major circulatory intersections where patios and intimate seating areas were designed for social interactions. In addition, a series of irregularly-shaped secondary paths were laid out across the classroom area's grid pattern creating an X-pattern in the diamond-shaped open space between buildings. The pavers for these X-pattern paths were jagged or curved to contrast with the straight lines of the buildings and major paths. The X-pattern was planned for the open space between the Business Education building and the Fine Arts Center to the southeast for a direct path of travel between the two complexes. Although an X-pattern was planned for the open space between the Business Education and Science Buildings as part of the Science Building's landscape plan, only a single pathway was built to extend the east-west path of travel from the Student Center. Another single pathway extended from the Science Building south, establishing a direct route to the Technology Building.

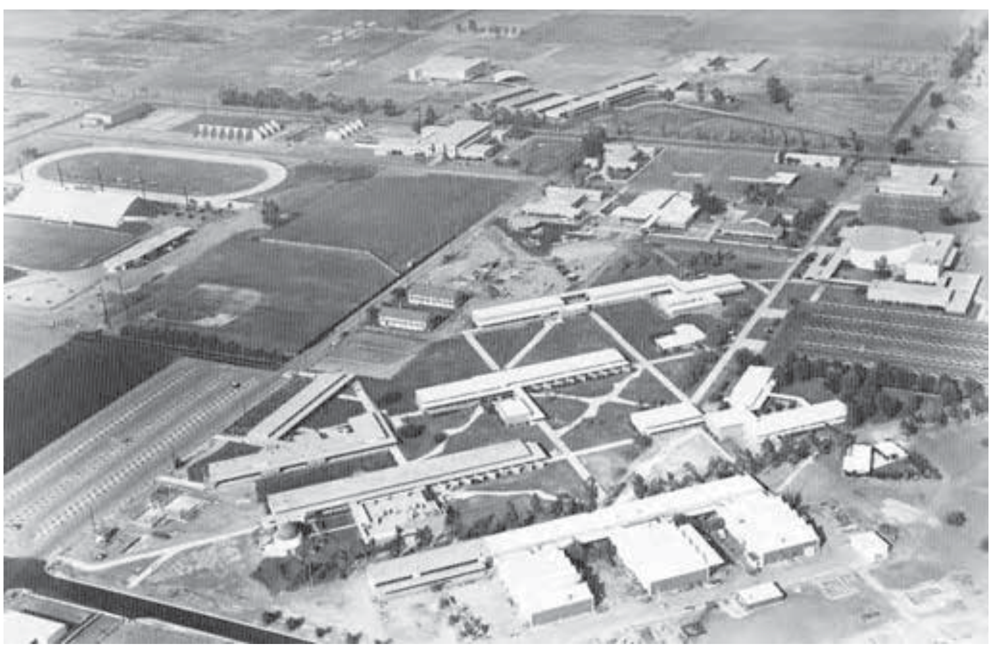

Figure 1B-45: Aerial view of Orange Coast College circa 1959 with circulation pattern and landscape areas visible. Source: OCC Archives.

Eckbo updated plans in 1956 for the central plaza envisioned between the Theater (Bldg. 2) and the Library (Bldg. 7). The design called for a raised concrete pad, several large planters with integrated bench seating, interstitial lawns, and plantings of varied size and scale. North of the planned plaza location was to be an expansive open lawn with various tree clusters, including a linear patter of palm trees set parallel to the façades of the Library and Classroom complex (Bldgs. 7, 8, & 9). The Orange Coast Junior College District Board felt the plan for the central plaza was too elaborate and therefore the full design was never realized.[44] Only the cluster of palm trees was planted.

It appears that much of Eckbo's proposed landscaping for each of the buildings were reduced or never executed. However, by 1957 when Neutra, Alexander, and Eckbo ended their work at OCC, a distinct classroom area with a diamond grid landscape with secondary cross paths is clearly visible. The significant east-west axis extending from the Student Center through the classroom complexes is also clearly present, as are the patios and seating areas at these intersection nodes (Figure 1B-45). Landscaping at the buildings outside the classroom areas, most notably the outdoor lobby for the Theater and the landscaping at the Stadium were realized to a point though it is not clear if Eckbo's proposed plantings were installed.

In the 1970s, the addition to the Business Education Building (Bldg. 14) and construction of Building 10 disrupted much of the original landscape, eliminating some of the X-pattern pathways that were set in these spaces as well as the primary east-west axis through the classroom area. New landscaping was added during this time that has since matured, such as the group of trees along the north side of Building 13 at Business Education.

The few remaining cross pathways with irregular pavers were replaced with more standard poured paving though the circulation pattern remains. Other hardscape elements were altered as well, including the quarter-circle reflective pool outside the Planetarium, which was filled in with concrete and evokes the shape of the original pool.

The demolition of the Technology Building and the Fine Arts Center and the subsequent new construction altered other aspects of the landscape. The windbreak plantings outside the Technology Building were lost, save a cluster set between the current Reprographics Building (Bldg. 37) and the new library built on the site of the demolished Technology Building. With the removal of the Fine Arts Complex, the east-west pathway from the Theater could be extended to the new library and creates the southern boundary for the Historic District.

[44] Board of Trustee meeting minutes, Jan 9, 1956.

1C. PHYSICAL DESCRIPTION

This part of the report provides a physical description of the Orange Coast College Historic District as defined by Page & Turnbull, including contributing buildings, objects, and landscape features. The order of this section is:

- OCC Historic District
- Buildings 7, 8, 9 | Student Success Center and Classroom & Labs complex
- Buildings 12, 13, 14 | Business Education complex
- Buildings 2, 3, 4 | Theater and Music complex
- Buildings 35, 36, 37, 38, 39 | Math and Planetarium complex
- Building 93 | Swimming Pool complex
- Buildings 105 & 110 | Stadium and Field House
- Armillary Sphere Sculpture
- Contributing Landscape Features
- Historic District Non-Contributors
- Surrounding Context

OCC Historic District

Page & Turnbull identified an eligible historic district on the campus of Orange Coast College. The OCC Historic District (Historic District) consists of buildings and features constructed as part of the initial campus development between 1950 and 1957. The Historic District is within the concentration of academic and administrative buildings at the southeast quadrant of the campus. The irregular district boundaries inscribe the original classroom area with a diamond-shaped grid pattern of diagonal pathways and buildings oriented 45° to the north-south axis. Its east and south boundaries are broad pedestrian walkways except at the southeast corner where the boundaries extend to include the nearby Robert B. Moore Theater and Music Building (Bldgs. 2 and 4) (Figure 1C-1).

In addition, two features, the Swimming Pool complex (Bldg. 93) and LeBard Stadium and Field House (Bldgs. 105 & 110) are discontiguous parts of the Historic District and located among the school’s athletic facilities toward the northeast quadrant of campus.

O	38	Science	Science Office	Building	1960	Pleger, Blurock, Hougan, Ellerbroek

Below are descriptions of each contributor grouped by the original complex construction. The complexes within the core of the Historic District are first and arranged in chronological order of completion. The discontiguous features are next, followed by the armillary sphere sculpture contributing object and the contributing landscape features. Finally, the non-contributors and the context surrounding the Historic District are described last.

As the distinctive clock tower is attached to Building 7, it is described and included with Building 7.

Buildings 7, 8, 9 | Student Success Center and Classroom & Labs Complex

The Student Success Center (SSC) and Classrooms & Labs (C&L) complex is a collection of four buildings at the southeast corner of the Orange Coast College Historic District. Consisting of the original Library (Bldg. 7) and its addition (Bldgs. 8 and 9), the complex is on the diagonal orientation intended for the classroom buildings and has the distinctive clock tower (Figure 1C-2).[1]

Figure 1C-2: North façade of Student Success Center (Bldg. 7) west wing with clock tower and part of Classroom & Lab (Bldg. 8).[2]

Bldg.	Year Completed	Original Name	Architect	Landscape Architect
7	1951	Library	Robert E. Alexander	Dick Besson
	1960 addition		Pleger, Blurock, Hougan, & Ellerbroek	
8	1951	Library	Robert E. Alexander	Dick Besson
	1955 addition	Library Addition	Neutra and Alexander	Eckbo, Royston & Williams
9	1955	Library Addition	Neutra and Alexander	Eckbo, Royston & Williams
9b	1955	Toilet Building	Neutra and Alexander	Eckbo, Royston & Williams

[1] As per the original plans for the diagonally-oriented buildings, this report considers the northeast-facing façade as plan north or north.
[2] All photographs in this section of the Historic Structures Report were taken by Page & Turnbull, 2014-2015, unless sourced otherwise.

Building 7: Student Success Center (originally Library)

Figure 1C-5: North window wall façade of Student Success Center (Bldg. 7) west wing looking east.to the building's north elbow.

Exterior

Building 7 is a single-story building with wood-framed, tilt-up concrete and reinforced masonry walls constructed on concrete wall footings.

It is roughly S-plan in plan consisting of two wings that overlap and jog at the center creating a north and south elbow (Figure 1C-4). A courtyard is in the north elbow between Building 7's west wing and Building 8 (Figure 1C-5). The main entrance is nearby under a vestibule that is part of the covered walkway connecting Building 7 with Building 8 (Figure 1C-11). The distinctive clock tower near Building 7's north elbow is a 50-foot, open steel-frame structure with clock faces on both sides at the top.

The two wings are roughly similar in size and materials. The east wing is situated more north and the west wing more south. For both, the north façades are primarily aluminum-framed windows between wood framing posts and on a low brick wall. The windows and low brick wall are angled from the bottom out with the brick corbeled (Figure 1C-6). At the ends of the north facades are brick-clad shear walls. A projecting stucco and brick-clad restroom wing is near the east wing's western end where the clock tower is attached.

The south façades are brick below the metal roof and tall fascia with few openings; a brick-clad mechanical room projects southward near the west wing's east end (Figure 1C-7).

Figure 1C-6: North façade of Building 7 east wing with classroom door openings inserted into the angled glazed wall. The straight brick-clad shear wall is at the left and the clock tower at the right is attached to the brick-and-stucco restroom projection.

Figure 1C-7: South façade of Building 7 with west wing to the left, mechanical room addition in center, and east wing to the right, looking plan north.

The far east and west facades are tilt-up concrete walls with a small equipment shed addition at the west façade (Figure 1C-8 and Figure 1C-9). At the south elbow where the two wings meet, the west wing's east façade is also brick (Figure 1C-8). At the north elbow in the courtyard, the east wing's west façade is glazed with an end stucco panel (Figure 1C-10). The side-gabled building has membrane-covered shed roofs on the north half of both wings that create overhangs with stucco-clad boxed eaves (Figure 1C-8). The south halves originally had lower flat roofs on which pitched, standing seam metal-clad roofs have been added. Below the standing- seam metal roof are tall stucco paneled fascias with integrated scuppers that create slight overhangs (Figure 1C-7 and Figure 1C-9).

Figure 1C-8: Building 7's concrete east façade (east wing) with the west wing's brick east façade and recessed rear south entrance in the background, looking northwest. The building's original shed and flat roof outline is visible above the east façade, as is the added standing seam metal roof on the south half of the building.

Figure 1C-9: Building 7's west wing with its brick-clad and stucco fascia south façade and tilt-up concrete wall west façade and shed addition. Standing seam metal roof on the south half of the building visible.

Windows are primarily aluminum throughout with a mix of awnings, hoppers, and fixed windows. The north façades have continuous windows with concrete sills and occasional inset door openings (Figure 1C-5 and Figure 1C-6). The windows walls are three-lite or occasionally four-lite high where the lower pane is split horizontally. They typically have clear glazing with tined film. The west wing's south façade has awning clerestory windows between the tall fascia and the brick walls (Figure 1C-9). A previous sliding glass door opening also on this façade has fixed aluminum panes. At the south elbow, the west wing's east façade has a set of three awning windows above fixed panes (Figure 1C-8). The east wing's west façade at the north elbow (courtyard) has full-height fixed windows (Figure 1C-10).

Doors are primary on the north façades, including the main entrance on the east wing's north façade toward the building's center under a vestibule that is part of the covered walkway connecting Building 7 with Building 8 (Figure 1C-11). The main entry doors are a pair of hollow metal doors next to a full-height two-paned fixed window. Nearby are a pair of wood doors on piano hinges that lead to a closet.

Figure 1C-10: West glazed façade of Building 7's east wing overlooking the courtyard. The main entry vestibule is to the left (north).

Figure 1C-11: Vestibule to Building 7's main entrance at the north elbow of the building, looking plan south. The right openings leads to Building 7's courtyard and Building 8's south covered walkway.

The south façade has a secondary entrance, also near the building center that is recessed under a canopy supported by two perpendicular decorative brick walls (Figure 1C-8). The secondary entry doors are two single wood and glazed doors below the canopy.

At the east wing's north façade, four non-angled door openings have been inset into the window and brick wall for access into three individual classrooms; each door opening has a single hollow-metal doors with an opaque transom (Figure 1C-6). The west wing's north façade at the courtyard has three double door openings each with aluminum-framed glazed doors, transoms, and sidelites (Figure 1C-5).

The far east façade has a pair of doors and a single steel door that has been fixed closed (Figure 1C-8). The west façade has no doors. The mechanical room addition on the building's south façade has hollow metal doors on its east and west facades.

Interior

Building 7 is predominantly classrooms and study space. The east wing has three large classrooms that are accessed directly from the exterior (Figure 1C-12). The far west room, Room CL103 has a brick wall at its west wall.

Figure 1C-12: Typical classroom in Building 7's east wing, looking south. Note the full-height dividers to the left (south), which marked where the lower roof was originally.

The west wing is primarily a large open space with offices at the west end and along the lower, south side (Figure 1C-14). The east end has various study rooms and partitioned space, including an employee break room with the secondary entrance to the south façade. The main entrance at the north elbow leads to an open space that is divided with a partition wall toward the rear (south) (Figure 1C-13). A door connects this space to the west wing's open room.

The ceilings have all been dropped in all rooms throughout the building with different kinds of acoustical tile systems that may conceal original clerestory windows. Internal walls are mostly drywall partitions with occasional painted bricks. Flooring is carpet throughout other than in the restroom which has a tile floor.

Figure 1C-13: Open space from the main entry where the two wings intersect. The glazed wall overlooks the courtyard between Building 7 and Building 8.

Figure 1C-14: Room 103B, open space in Building 7's west wing. Offices line the south (right) side.

Buildings 8 and 9: Classrooms & Labs (originally Library Addition)

Figure 1C-15: North façades of Buildings 8 (right) and 9 (left). A landscaped patio is between the two buildings.

Exterior

Buildings 8 and 9 are single-story buildings with tilt-up concrete and reinforced masonry walls on concrete pile foundations that are similar in size, materials, and construction (Figure 1C-15). The buildings are rectangular in plan with a membrane-covered shed roof and oriented diagonally.[3] Building 8 has an office wing at the east end that is lower and offsets to the north (Figure 1C-16). The buildings' shed roofs extend to the north to create slight overhangs that are finished in stucco box eaves with metal flashing. They have a covered walkway along their plan south facades that break at the landscaped patio between the two buildings (Figure 1C-17). A stand-alone restroom building (Bldg. 9b) and a brick screen wall are on the south side of the covered walkway across from Building 9 (Figure 1C-4). Building 8 also is connected to Building 7 via a covered walkway at the east end.

The north façades are primarily aluminum-framed windows between steel framing posts on a low brick wall and angle from the bottom out; the bricks are slightly corbeled (Figure 1C-15). Building 8's office wing that projects north from the main building also has aluminum-framed windows over a low brick wall but the façade is not angled (Figure 1C-16).

The south façades of Buildings 8 and 9 are tilt-up concrete walls with regular door openings leading to classroom and laboratory spaces (Figure 1C-17). Clerestory windows with aluminum louvers are above the covered walkway's roofline and partially obscured or infilled by HVAC equipment. The south façade of Building 8's office wing is stucco on one side of a hallway and brick on the other; the office wing does not have clerestory windows.

[3] Although the original 1954 plans for the Building 8 addition and Building 9 marked the north façade as "east elevation," for the consistency, this report considers the northwest-facing façade as plan north or north.

Figure 1C-16: North façade of Building 8 with its smaller office wing and Building 7's clock tower.

Figure 1C-17: Typical south façade of Building 8 and 9 with louvers covering clerestory windows and added HVAC equipment above the covered walkway.

Buildings 8 and 9's west façades and Building 9's east façade are tilt-up concrete walls with no openings. Building 8's east façade is brick at the office wing as well as at the main building where it connects with the office wing and is visible below the covered walkway and above the office wing (Figure 1C-16).

Windows, which are on the north façades of both building, Building 8's office wing east façade, and the clearstories at the south façades, are primarily aluminum framed with a mix of awnings, hoppers, and fixed. The north façades have continuous windows on a concrete sill; Building 8 has occasional inset door openings. The windows walls are three-lite or occasionally four-lite high where the lower pane is split horizontally windows (Figure 1C-18); Building 8's office wing windows are three-lite high with a center awning. The windows typically have clear glazing with tined film or are obscured in some sections. Building 8's office wing east façade has a group of four three-lite windows where a few have blue colored glazing. The south façade's clerestory windows, which are fixed or two high with an operable pane, remain but the glazing has been painted on the interior or removed for HVAC vents.

Figure 1C-18: Building 9's north façade with typical windows.

Doors are primary on the south façades and are half-glazed wood or metal with matching frames and non-original lever or knob handles. Building 8 has had three pairs of fully glazed, aluminum framed doors added to the north façade with glazed transom above. At the office wing, half-glazed wood doors lead to offices from the hallway (Figure 1C-18).

Figure 1C-19: Building 8's office wing and its open hallway. This area is under the covered walkway that connects Building 8 and Building 7 and is the vestibule of Building 7.

Interior

Building 8 has three classrooms, a storage room, and two X-ray rooms in the main building and five offices and a women's restroom in the office wing. Building 9 has five classrooms (Figure 1C-20 and Figure 1C-21). The classroom partition walls are tilt-up concrete walls while newer room partitions are drywall. One classroom has non-historic faux wood veneer. The ceilings have acoustical board and flooring is typically carpet. The offices in the office wing have panelized partitions.

Figure 1C-20: Typical classroom in Building 8 and 9, looking south.

Figure 1C-21: Typical classroom in Building 8 and 9, looking north.

Building 9b

The one-story, flat-roofed restroom building is south of the patio and aligns with the brick screen south of Building 9 (Figure 1C-22). It is brick on the south, east, and west façades, which wraps around to the north façade at the west end The north façade has painted plywood-clad walls and four wood doors with lower vents (Figure 1C-23). Two doors are for the Men's and Women's restrooms, and the other two lead to a storeroom and a mechanical room. A full-height vent with louvers is also on the façade. The storeroom has original shelving. The restrooms have a tile floor with a tile wainscot with painted gypsum ceilings using plastic toilet partitions.

Figure 1C-22: Building 9b's south facades with adjacent brick screen wall, looking northwest.

Figure 1C-23: Building 9b's north façade below covered walkway and across from Building 9.

Covered Walkway

A wood-framed covered walkway is attached to the plan south elevation of Buildings 8 and 9 and the north side of the restroom building (Bldg. 9b) (Figure 1C-24). It jogs at the east end to connect Building 7 and the office wing of Building 8 (Figure 1C-25). It breaks at the landscaped patio between Building 8 and 9. The covered walkway supports are metal posts on its south outer edges. Some wood posts are also seen and a bulletin board case is set between two posts. Board and batten is at the underside of the covered walkways while HVAC units and conduits are mounted on top. Low parapet walls screen some of the equipment.

Figure 1C-24: Covered walkway and Building 8's west end at the patio, looking east.

Figure 1C-25: Covered walkway jogs at the east end where it connects to Building 7 (right). Also note typical classroom doors and concrete walls along Building 8 and 9's south façade under the covered walkway.

Landscape

Building 7 is surrounded by turf on the plan east, south and west sides. A concrete paved courtyard space is located between its west wing and the south façade of Building 8 (Figure 1C-5). In the courtyard, planting strips are set immediately adjacent to Building 7's north façade with low-profile semi-tropical plantings and palms and other trees. Hardscape borders are minimal, except for a raised concrete curvilinear curb set at the planting strip at the east end of the courtyard (Figure 1C-10). Two rectilinear planting strips are at the north edge of the courtyard adjacent to the covered walkways of Building 8.

Buildings 8 and 9 have planting strips between their north facades and an adjacent paved walkway. The plantings are small semi-tropical shrubs, wildflowers, and a single palm near Building 8's east office wing (Figure 1C-15). The planting strip wraps around Building 8's east office wing to become a larger planting area with similar vegetation (Figure 1C-16). The north facades of Buildings 8 and 9 face the expansive lawn with clusters of palm trees toward the east that is one of the campus's main quads.

Between Buildings 8 and 9 is a landscaped patio, which serves as both a seating space and circulatory passage (Figure 1C-26 and Figure 1C-27). The stucco box eave along the north facades of Building 8 and 9 connect as a soffit across the north side of the patio with a wood and metal trellis projecting over the patio. The trellis is supported by two tapered metal I-beams. The patio has brick and concrete paving as well as brick planters and movable picnic tables. A narrow rectilinear planter strip extends two-thirds the length of Building 8's west façade. It features a mid-rise shrub that encloses a small eucalyptus tree set immediately adjacent to Building 8. An L-shaped brick planter extends from the east façade of Building 9. The north façade of Building 9 features a narrow planting strip that runs the length of the façade. The eastern two-thirds have shrubs, whereas the western third has gravel fill.

Figure 1C-26: Landscaped patio with brick and concrete paving and a low L-shaped brick planter between Buildings 8 and 9. Note the trellis, soffit, and support posts.

A brick screen wall is located west of Building 9B in line with the building's south façade. Between the brick wall and Building 9's covered walkway are two planting strips separated by a concrete slab with picnic tables and concrete trash containers. Both planting strips feature manicured shrubs, low-profile palms, mulch topsoil, and are connected by a narrow planting strip set between the brick wind wall and the concrete patio slab.

Figure 1C-27: Patio between Bldg. 8 (left) and Bldg. 9 (right) as part of campus circulation, looking southwest.

Figure 1C-28: Brick screen wall with concrete slab and planting strips south of Bldg. 9's south covered walkway, looking west.

Buildings 12, 13, 14 | Business Education Complex

The Business Education complex is a collection of three buildings in the center of the historic academic core. The complex is roughly L-shaped with covered walkways connecting the three buildings. A covered breezeway separates Building 12 to the east and Building 13 the west; the covered walkway extends into the breezeway and out south toward Building 14. The complex is on the diagonal orientation historically intended for classroom buildings.[4]

Figure 1C-29: Business Education breezeway between Bldg. 12 (left) and Bldg. 13 (right), looking south to Bldg. 14.

Bldg.	Year Completed	Original Name	Architect	Landscape Architect
12	1953	same	Neutra and Alexander	Eckbo, Royston & Williams
13	1953	same	Neutra and Alexander	Eckbo, Royston & Williams
14	1953	same	Neutra and Alexander	Eckbo, Royston & Williams
	c. 1977 addition	same	William Blurock & Partners	

[4] As per the original plans for the diagonally oriented buildings, this report considers the northeast-facing façade as plan north or north.

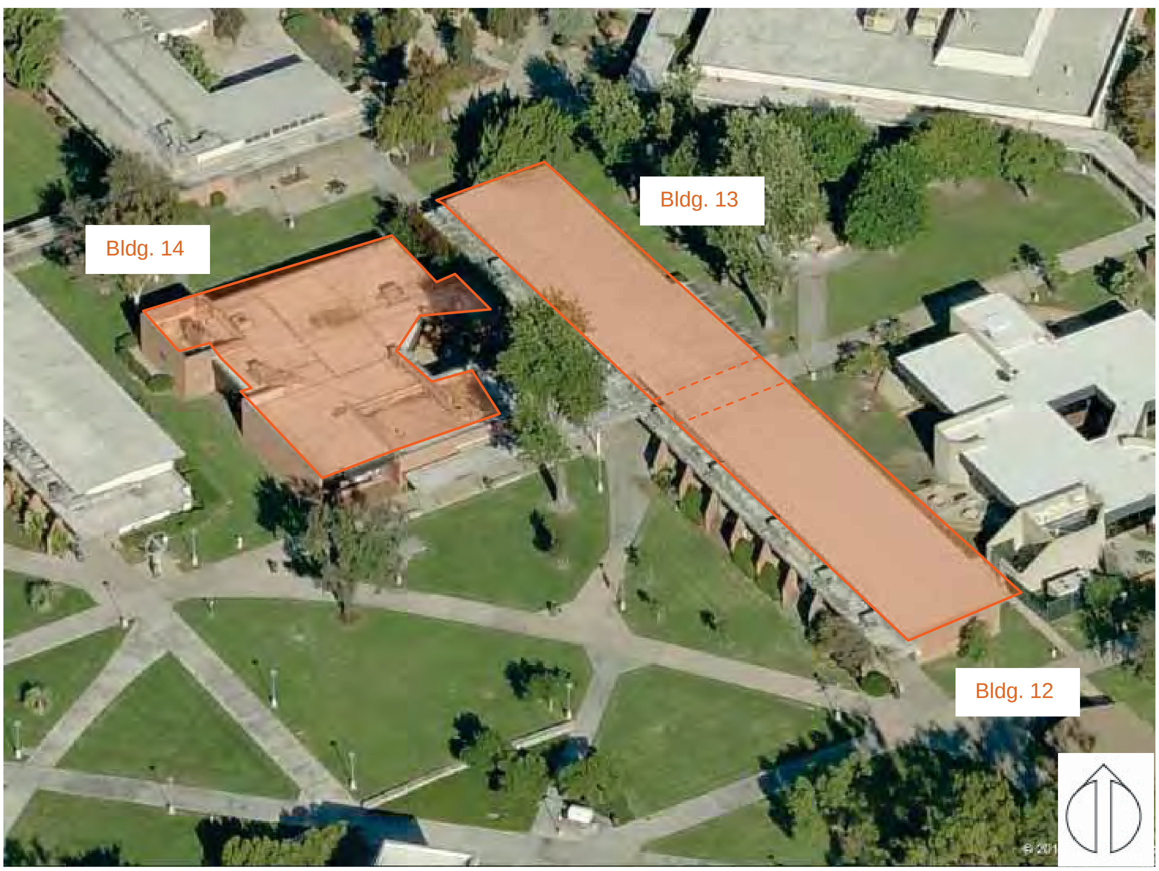

Figure 1C-31: Business Education complex with Buildings 12, 13 and 14. A covered breezeway separates Buildings 12 and 13. Source: Bing Maps, edited by Page & Turnbull, 2015.

Building 12 and 13

Figure 1C-32: The metal trellis on the north side of Building 13 at the breezeway.

Exterior

Buildings 12 and 13 are single-story, wood-framed and reinforced masonry buildings on caissons that are similar in size, materials, and construction. The buildings are generally rectangular in plan and share a membrane-covered side-gabled roof that covers the breezeway separating the two buildings (Figure 1C-29). Eaves with tongue and groove wood soffits overhang on both sides of the roof. Building 12 is longer than Building 13 and set slight more toward the north while the east end of Building 13 adjacent to the breezeway projects north. Aluminum metal sun shades or trellis supported by exposed wood rafters are at the north side of the breezeway and across Building 13's projecting east end (Figure 1C-32). The buildings share a covered walkway along their plan south facades that is supported by diagonal reinforced masonry wing walls at Building 12.

Brick as part of the reinforced masonry walls is the primary cladding material for Buildings 12 and 13. The principal façades (plan south) of both buildings are brick with a regular pattern of door openings to access individual classrooms and large steel tube columns from a seismic retrofit. There are also occasional projecting utility sheds. A band of near continuous aluminum-framed clerestory windows is above the covered walkway roofline and partially obscured or infilled by HVAC equipment (Figure 1C-33).

The plan north façades of Buildings 12 and 13 are aluminum-framed windows on a low brick wall interspersed with brick-clad shear walls (Figure 1C-34). The window and brick walls are angle from the bottom out with a slight corbeling to the bricks while the shear walls are not angled. The projecting east end of Building 13's north façade is primarily brick with a pair of window that are angled.

Figure 1C-33: South façade of Buildings 12 below covered walkway supported by brick wing walls. HVAC ducts are in the clerestory windows above the covered walkway.

The plan west façades of both buildings, and the plan east façade of Building 12 are brick with a tapered aluminum-clad section at the north end to transition to the north façade's angled wall (Figure 1C-39). The plan east façade of Building 13 is almost entirely glazed with full-height, wood-framed fixed windows and matching transoms between brick returns. A single wood door is offset at the center. At the base of the glazing are small louvers.

Windows are primarily aluminum throughout with a mix of awnings, hoppers, and fixed windows. The north façades have three-lite-high windows in pairs of fixed and awnings on precast concrete sills; the awnings are at the upper and lower lites, which are divided horizontally, and crank open as a set of four (Figure 1C-36). The typically have clear glazing with tined film. The south façades have hopper and fixed clerestory windows, and the glazing has been painted on the interior or removed for HVAC vents. Clerestory windows are also at the south side of breezeway above the intersecting covered walkway and are fixed.

Figure 1C-34: North façade of Buildings 12 and 13, looking southeast. Showing angled aluminum framed windows and brick walls with slightly corbeled sections.

Doors along both buildings' south façades are wood with wood frames. Classroom doors are half-glazed with non-original lever handles. Doors for the restrooms and a small mechanical room toward the east end of Building 13's south façade have wood doors. All doors have a painted plywood transom above and some have painted plywood paneling to the sides.

Figure 1C-35: East end of Building 12 with tapered aluminum section to transition from the north façade's angled wall. Brick-clad shear wall for seismic retrofitting seen here on the north façade.

Individual black metal lettering for “BUSINESS EDUCATION” are on Building 13 at the west façade and north façade’s projecting east end by the breezeway.

Figure 1C-36: Typical Building 12 and 13 windows with four awning windows connected and operated by one crank.

Interior

Building 12 has four large classrooms and Building 13 two large classrooms (Figure 1C-37). The interior partition walls are painted brick with a drywall separation in one of the classrooms of Building 13. Ceilings have a large steel beam down the center and acoustical board. A soffit faced with acoustical board runs around the east, west, and south walls below the clerestory windows. The flooring is primarily carpet. Wood veneer paneling with a built-in channel is below the windows along the north wall. A narrow, single-leaf, hinged wood shutter doors is at either end of the north windows. Other built-in wood-veneer cabinetry remains in some rooms.

Figure 1C-37: Typical classroom in Building 12 and 13. Note the shear wall at the right.

Building 14

Figure 1C-38: East façade of Building 14, looking west. Building 12 and 13 are to the right (north). The right brick façade is the original building before an addition (left) was added in the 1970s.

Building 14 is a one-story, brick-clad building located south of Building 13 and southwest of the where the covered walkways intersect (Figure 1C-38). The building is irregular in plan with a flat roof. Dark aluminum-framed window walls with dark glazing and a deep aluminum fascia are at some façades. At the east façade is a recessed display window with wood-clad walls. The brick facades at Building 14's northeast corner are part of the original building.

Covered Walkways

A wood-framed covered walkway runs the length of the plan south façade of Buildings 12 and 13 below the clearstories. An intersecting covered walkway extends from the breezeway toward the east façade of Building 14. The south side covered walkway has board and batten ceilings and supports on its south outer edges. Round metal posts with occasional reinforcing posts support the walkway in front of Building 13. Oblique angled reinforced masonry wing walls support the walkway in front of Building 12 (Figure 1C-39). HVAC equipment and ducts that run through and obscure the clerestory windows are on the south facade walkway roofs.

The covered walkway from the breezeway to Building 14 have round metal posts on both the east and west edges. The ceiling is tongue and groove wood.

Figure 1C-39: Building 12's south façade with clerestory windows concealed behind HVAC equipment on the covered walkway, which is supported by angled brick wing walls at this side The building's brick east façade is also visible.

Landscape

Expansive open space is south of Building 12, north of Building 13, and west of Building 14 (Figure 1C-31). The open space south of Building 12 is a turfed quad with concrete curved pathways in an X-pattern. A few trees are in the quad. Building 12's brick wing walls are along the quad's north border. The gaps between the wing walls feature shrubs or exposed topsoil.

North of Building 13 is an irregular-shaped courtyard created with the Computer Center (Bldg. 73) at the north. The courtyard is grass covered with two clusters of mature trees (Figure 1C-34). Two pathways cut through the courtyard and a circular concrete seating area is at the pathways' intersection. The open space east of Building 14 is a smaller space with a covered walkway and the Journalism Building (Bldg. 72) at the west edge and the Building 35 Math Wing at the south. It has lawn with a few trees and a pathway.

Between Building 13 and Building 14, just southwest of the breezeway is a brick and concrete paved patio space (Figure 1C-42). The patio has narrow irregularly shaped concrete edge planters with minimal groundcovers and low-profile shrubs and mulch top soil, bounding the patio space from both buildings. Aluminum picnic tables are present.

Figure 1C-40: Patio between Building 13 (right) and Building 14 (left and background) just southwest of the breezeway as noted by the intersection of covered walkways.

Also between Building 13 and 14 further west is a brick screen wall with a planting strip of mixed low-profile shrubs and small trees. Where the screen wall intersects with Building 14's north façade is vine plantings that cover the fascia as a green wall.

Figure 1C-41: Brick screen wall between Building 13 (left) and Building 14 (right) with planting strip, looking east.

Along both Building 12 and 13’s north façades are planting strips. At Building 12, the planting strip continues along the north façade beyond a concrete pad and is gravel filled with wood edging. The planting strip along Building 13’s north façade wraps around to the west façade and features a mixture of low-profile shrubs, semi-tropical ground cover, and exposed top soil. Adjacent to Building 13’s west façade are three trees and exposed top soil.

At the breezeway between Buildings 12 and 13 are two wood slat benches are set against Building 12 as well as a narrow brick planter at the north half of Building 13’s east façade that wraps around to its north façade. The brick planter wall extends approximately five feet before terminating next to the north façade’s planting strip.

Building 12 has a rectangular planting area at its east façade that separates the building from a major circulation intersection and that wraps around the building’s north façade (Figure 1C-35). A mixture of low shrubs, ground coverings, and a single tree are in this planting area with uncut rocks arranged in irregular patterns at the edges. An interstitial planting space of shrubs, small trees, exposed top soil, and ground coverings is set between Building 12 and the neighboring Special Services Building (Bldg. 10).

Buildings 2, 3, 4 | Theater and Music Complex

The Theater and Music complex, originally the Speech Arts Building, is composed of four unique buildings connected by covered walkways (Figure 1C-42). Most prominent is the Robert B. Moore Theater (Bldg. 2), which has a stand-alone ticket office building. Building 4, the original Music Building with a later addition is to the west while the New Music Building (Bldg. 3) is south and to the rear of the Theater (Bldg. 2). The complex is set at the ordinal directions at the southeast corner of the OCC campus and is surrounded by parking lots on east, south, and west. At the north, the complex faces into the campus interior.

Figure 1C-42: The Theater and Music complex with the Robert B. Moore Theater (Bldg. 2) and its outdoor lobby below the covered walkway. The Music Building (Bldg. 4) is out of frame to the right. Looking southeast.

Bldg.	Year Completed	Original Name	Architect	Landscape Architect
02	1955	Auditorium	Neutra and Alexander *Acoustical consultant: Vern Knudsen*	Eckbo, Royston & Williams
	1975 addition	Drama Workshop	William Blurock & Partners	Lang & Wood
	2006 addition	Scene Shop	MVE Architecture	
02b	1955	Ticket Office		
03	1976	New Music Building	William Blurock & Partners	Lang & Wood
04	1955	Music	Neutra and Alexander	Eckbo, Royston & Williams
	1965 addition	Music Addition	Robert E. Alexander & Associates

Building 2: Robert B. Moore Theater

Figure 1C-45: North façade of the Theater, showing the board formed curved concrete wall and tiered landscaping, looking south.

Exterior

Building 2 is composed of a series of one-story connected wings dominated by the tall Auditorium, Stage House, and Scene Shop wings. The tallest feature is the plectrum-shaped Robert B. Moore Theater auditorium at the primary north side of the building. The auditorium has a painted poured-in-place concrete exterior that is curved and textured (Figure 1C-44 and Figure 1C-45). The board-formed pattern is vertically oriented with narrowly set grooves that repeat throughout. The membrane-covered roof is curved along the north-south axis and there is a deep integrated copper gutter between the roof and the concrete parapet walls. The roof has internal downspouts that exit into an open concrete gutter at the edge of the building.

A soffit juts out from the north façade and connects with the covered walkway extending the length of the Building 2's north façade. A wooden panel screen is at the west end of the soffit. Below the soffit, the north façade wall of the auditorium is wood siding in a pattern matching the poured-in-place concrete and curving with the façade. Within the wood siding are four evenly spaced hidden double-door public entrances to the auditorium; only the far east set of doors have handles though the hinges visible marking the doors (Figure 1C-47).

Attached to the south of the auditorium is the Stage House (Figure 1C-47). It has a rectangular plan oriented east-west with matching painted and textured poured-in-place concrete walls. The roof is close to flat with a membrane cover, flashing over the wall heads, and an internal drain system. At the center of this roof there is a raised 'smoke tower' with a flat membrane covered roof overhanging on the south, stucco walls and closed vents on both sides. The southwest corner of the roof is lower to accommodate and screen mechanical equipment. This area is surrounded by a parapet wall to maintain a continuous roofline. There are no visible openings in this part of the building.

Figure 1C-46: North façade of the Theater, showing the wood siding with hidden doors and soffit above that connects with the covered walkway to create the outdoor lobby. Note the integrated strip of lighting in the covered walkway. Looking east.

Figure 1C-47: The Stage House south of the Theater Auditorium (left) is the rectangular mass at right. Note the overlapping walkways in the foreground as well as the later, c.1970s walkway to the Fine Arts Lecture Hall (Bldg. 5) at right foreground. Looking southeast.

Two low wedge-shaped wings are at the corners where the Auditorium and Stage House connect. These wings are brick clad with flat roofs. North of these wings are emergency exit double doors either side of the Auditorium within the concrete façade.

At the rear of the building, south of the Stage House is another rectangular wing also aligned east-west and with similar painted and textured poured-in-place concrete walls. Added in 1974 as the Drama Workshop, this wing houses a second performance space called the Drama Lab and a Small Lab (Figure 1C-46). The roof is close to flat with a membrane cover and parapet walls. At the southwest corner is a small triangular entrance hall and ticket office. One wall of the triangular massing is brick with dark aluminum doors while the other wall has three dark aluminum-framed fixed windows above an angled concrete base. A ribbed aluminum fascia is above the windows with an electronic marquee above the fascia. At the Drama Workshop's southeast corner is a brick service enclosure with a low canopy sheltering large sliding doors. The canopy and brick walls extend around the corner to conceal double doors in the Drama Workshop's east façade.

Figure 1C-48: Rear of the Moore Theater, which is the Drama Workshop addition from the 1970s. The triangular entrance to the second performance space is at left, as is Building 3, also from the 1970s. Looking north.

Attached at the east of the Stage House and Drama Workshop wings is the Scene Shop addition from 2006 (Figure 1C-50). The irregular plan wing has walls of panelized stucco with metal reveals. There are tall double doors on the south façade. On the east facade there is a tall roll-up door at the north end and a single door around the corner at the north façade. A lower wing is also at the north façade. Stretching between the east façade and the north façade's lower wing sheltering both openings is a metal fascia canopy supported on metal posts and a brick wall. A low curved brick wall screens mechanical equipment from view on the east facade.

At the Stage House's southwest corner is an attached L-shaped brick-clad wing original to Building 2's initial construction (Figure 1C-50). This wing is also attached to the Drama Workshop wing's west façade. The wing currently houses the costume shop as well as the men's and women's restroom serving the complex and accessed from the covered walkway. The wing has a flat membrane roof with wood fascia that is integrated into the covered walkway roofs with mechanical and venting equipment above. The wing primarily has aluminum-framed clerestory windows on its north and south façades. The south façade also has a pair of hollow-metal entry doors with a glazed transom that is adjacent to the triangular entrance hall of the Drama Workshop wing. Adjacent to the north façade of the wing, connecting between the Stage House and the wing, are a pair of hollow-metal doors with view lites and an opaque glazed transom above. Two full-height aluminum-framed fixed windows are next to the doors.

Attached to the northwest corner of the Stage House is a small one-story mechanical enclosure with brick and stucco walls and also attached to the covered walkway. A chain-link fenced enclosure for electrical equipment is also nearby.

Figure 1C-49: Scene Shop addition east of the Theater Building. The auditorium is at right. Looking west.

Figure 1C-50: Brick-clad L-shaped wing at the southwest corner of the Theater Building. Looking east.

Interior

Robert B. Moore Theater Auditorium walls are painted plaster with a geometric motif and wood veneer accents (Figure 1C-51). The flooring is linoleum below the seats and carpet in the aisles. The auditorium is raked and currently seats 916 with four aisles leading toward the stage, one from each entrances. At the north end of the auditorium above the public entrances is the projection booth and storage with stair access at either side. At each public entrance is a small vestibule with a pair of wood veneer doors angled north. The unadorned, rectangular proscenium frames a stage that extends over an area where the orchestra pit originally was, with metal stairs at each side providing stage access from the seating area; it is not clear if the orchestra pit remains below the stage extension. The ceiling has a series of coves in which lighting is hidden. The small wings behind the geometric wall motif on either side of the stage contain the make-up rooms, storage and office space.

The stage and back of house is in the Stage House wing, with the west end used for additional offices and labs (Figure 1C-52). The west end also includes a second story containing mechanical rooms and access to the space above the auditorium ceiling. A door in the west wall leads to the L-shaped wing. At the east end of the stage is an opening connecting to the Scene

Shop wing. The poured-in-place concrete east façade of the Stage House that was once the exterior is visible in the Scene Shop, which is primarily a large open space.

Figure 1C-51: Moore Theater interior.

Behind the stage is the Drama Workshop, which contains a Drama Lab and Small Lab. The Drama Lab is a second performance space with a sunken seating area in a tiered horseshoe configuration (Figure 1C-53). Its north wall was once the sliding doors that opened the Auditorium's stage to an outdoor amphitheater. The west end of the Drama Lab is a glazed mezzanine under which is the Small Lab. A small workshop space, the Small Lab has risers on the south end. The mezzanine, accessed by stairs down a hallway, has a large office space to the south and small rooms and storage to the north. Both the Drama Lab and the Small Lab have doors from the triangular vestibule entry at the wing's southwest corner, where a ticket box office is located. The two labs are also accessible from the main auditorium through the Scene Shop or the L-shaped wing.

Figure 1C-52: Moore Theater stage housed in the Stage House.

Figure 1C-53: Second performance space in the Drama Workshop wing with mezzanine at rear.

The L-shaped wing includes a corridor and green room as well as a costume workshop with a small storage room and laundry room. The men's and women's restroom are west of the costume workshop but only accessible from the exterior covered walkway.

Building 2B

Figure 1C-54: Building 2B at right and the Moore Theater (Bldg. 2) is at left. Note the integrated strip of lighting in the covered walkway connecting the two buildings. Looking west from circular drop-off driveway.

In front of the auditorium at the northeast corner is a small single-story standalone building that houses the ticket booth, office and restroom (Bldg. 2B) (Figure 1C-54). The flat-roof building is roughly rectangular in plan and has two wings. The original part of Building 2B is brick and stucco clad and shares the covered walkway with the Moore Theater. The east façade of the original wing faces a drop-off circle and has lettered signage for the theater as well as a bronze theater mask sculpture with a plaque: "'Masks' by Peterpaul Ott donated by Orange Coast College's Class of 1955."

An integrated cantilevered concrete bench is below the signage and sculpture. The ticket booth with a glazed window is at the south façade, marked by a perpendicular brick wall with "TICKETS" lettering (Figure 1C-55). The women's restroom is also here. To the north of the original wing is a stucco-clad addition that is slightly smaller and shorter (Figure 1C-56). The addition has the men's restroom and an office. Both are accessed in the northwest corner, which is notched with a canopy.

Figure 1C-55: Ticket window and perpendicular brick wall at Building 2B's south façade.

Figure 1C-56: North (left) and west (right) façade of Building 2B. Note the north half of the building is an addition with stucco cladding. The brick planter is part of the complex's landscaping.

Building 3: New Music Building

Building 3 is a standalone New Music Building completed in 1974 and constructed at the same time as the Drama Workshop addition to Building 2 (Figure 1C-57). It is considered part of the complex as it is connected by extended covered walkways to Buildings 2 and 4 that was constructed along with Building 3. The irregular plan building has two wings, one clad primarily in brick and the other in split-faced scored concrete masonry units. Its doors and windows are dark aluminum-framed with tinted glazing. The interior includes a music lab, instrument storage space, practice rooms, and mechanical rooms.

Figure 1C-57: Building 3's east façade with the rear Drama Workshop wing of Moore Theater (Bldg. 2) at right.

Building 4: Music Building

Exterior

Building 4 was the original Music Building with a 1964 addition to the south (Figure 1C-58). It is a rectangular, linear, wood framed and masonry building sited west of the Robert Moore Theater (Bldg. 2) and connected by covered walkways. The building is primarily one-story, with taller north and south ends flanking an off-center brick-clad section that is lower in height and which projects toward the west. A vertical unbonded joint at the center of the brick east and west elevations marks the division between the original Music Building (to the north) and later addition (to the south). The rest of the building is stucco-clad with no window openings. The wood-framed roofs of the taller north and south ends are slightly sloped to the west while the lower brick section has a flat roof with a membrane coating. The building rests on a concrete slab on grade with footings and foundation walls.

Figure 1C-58: South façade of Building 4 (left) and its east façade with door openings below the attached covered walkway.

Door openings with hollow-metal doors lead to individual classrooms along the east façade under the covered walkway. Areas of patched or different stucco is around the door openings, as well as in other patches on the east façade. Above the covered walkways is a door to a mechanical room at the north half of the building. Doors flanking the brick section each lead to a hall with individual practice rooms and/or faculty offices.

Figure 1C-59: West façade of Building 4 (left) with the brick-clad section centered.

The brick-clad section at the west façade is larger than that on the east façade and projects westward toward a parking lot (Figure 1C-59). Two exit doors are on this façade, with one in the brick section having an entry canopy. There are some vents on the west façade's second floor at both sides of the brick section and all with patched stucco around them.

The east and west facades have no openings. Attached to the north façade of the Music Building is a walled off area containing mechanical equipment. A brick, stand-alone equipment building is separated from Building 4's south façade by a paved walkway. Attached to the two-story part of the 1964 addition on the upper northern corner of the east façade and the upper west corner of the south façade there is attached individual lettering 'MUSIC'.

Interior

The Music Building (Bldg. 4) contains four large music classroom spaces. In the northern (original) half of the building are a guitar lab (Room 101) and recital room (Room 102) separated by a wedge-shaped storage area with a disabled access ramp to the top of the two rooms. These rooms are similar with tiered wood floors and a large wood-paneled back wall that curves to become a wood-paneled ceiling. The curved wall in Room 101 is original while it has been replaced with a similar but non-original wall in Room 102 (Figure 1C-60).

In the south (1964 addition) half, a large classroom (Room 106) space is at the building's southern end. It is a tall, double-high space with a flat, carpeted floor, an acoustical tile suspended ceiling, and painted walls with absorptive panels and pyramid diffusers above whiteboards. Next to it is an L-shaped piano lab (Room 105A) with a flat, carpeted floor, painted walls, and an acoustical tile suspended ceiling. Two small rooms are between the doors to Room 106 and Room 105A, each with its own door on the east façade. One is a mechanical space with access to the upper floor mechanic room. The other is a small classroom.

Figure 1C-60: Room 101 of Building 4 with original wood curved wall and ceiling.

In the brick-clad section are two sets of practice rooms and office lining hallways. A, solid brick wall divides the original building from the addition. The partition walls of the various rooms are painted drywall and covered masonry unit walls. There is an emergency exit at the end of each corridor to the back (west side) of the building.

Despite the apparent two stories at the north and south ends as seen from the exterior there is no second floor apart from the mechanical room at the north half. The height allows for raised ceilings in the classroom performance spaces.

Covered Walkways

The covered walkways have stucco ceiling finishes, metal posts, and concrete pavers. Covered walkways run east-west across the principal (north) façade of Building 2, ending where it overlaps with the end of a north-south covered walkway that is attached to and runs the length of the principal (east) façade of Building 4. Small perpendicular sections of covered walkway connect the north-south walkway at Building 4 to Building 2’s L-shaped wing at its southwest corner and to the entrances to Building 3. The north-south covered walkway along Building 4 has an integrated gutter system along its eastern edge.

The east-west walkway along Building 2’s front façade extends at its eastern end over stairs leading from the circular drop-off drive and has additional support of a brick wall as well as Building 2a. At its western end where it extends over the north-south covered walkway, there are also a set of stairs and a free-standing reinforced brick wall that is not attached to the walkway. A row of recessed florescent lights with transparent panels flushed with the stucco ceiling is along the walkway’s south edge lighting the walkway and the theater’s entries.

Landscape

The landscape along the primary (north) façade of Building 2 is the theater's outdoor lobby (Figure 1C-61). It has two large rectilinear terraces that span east-west. The top level terrace is adjacent to the theater entrances, is primarily covered by the covered walkway, and features strips of both smooth and rough aggregate concrete pavers (Figure 1C-62). The east end of the terrace extends between the box office annex (Bldg. 2B) and the north façade of the theater (Bldg. 2). Stairs and an access ramp at the eastern most end lead to a traffic circle.

Figure 1C-61: Outdoor lobby at Moore Theater's north side (Bldg. 2). Looking southeast.

The second, lower terrace has square rough aggregate concrete paving slabs (Figure 1C-63). This terrace is bounded by a series of plantings to form patio enclaves. The planters along the south side of the terrace feature brick masonry retaining walls, low-profile shrubs, and simple ground covers. These planters are at grade with the upper entrance terrace. The north planters are at grade with the secondary terrace and feature more elaborate plantings, including orange trees, wildflowers, and other small species of trees. Brick masonry retaining walls of these planters are set on the north, bordering the campus walkway. A wide set of stairs lead from this terrace down to the walkway.

The western end of the terrace extends into stairs, leading down to a perpendicular covered walkway. A wood-slat screening fence is set towards west end of the upper terrace and separates Building 2 from an expansive turf lawn that slopes to the south and west to reach grade. This lawn is irregular in shape, features trees, and is bounded by curved planters. These planters have brick masonry edging, low-profile shrubs, and a mulch top soil. Two Eucalyptus trees are set in a planter set between the lawn and the west façade of the Theater (Bldg. 2).

Figure 1C-62: Upper terrace of outdoor lobby adjacent to the theater's north public entrances (left). Looking southwest.

Figure 1C-63: Lower terrace of outdoor lobby with brick planters and exposed aggregate pavers. Looking west.

Figure 1C-64: West end of terrace with overlapping covered walkways and lawn to the south.

Figure 1C-65: East side of Moore Theater with disabled access ramp and lawn.

The east façade of Building 2 features irregularly shaped sections of turf lawn, the largest of which is bounded by an extensive planting strip that slopes from the entrance terrace level down to grade. It features mulch top soil, large trees, simple ground coverings, low-profile shrubs, wildflowers, and a concrete curvilinear retaining wall along the northern edge. This retaining wall defines the disabled access ramp leading from the upper terrace. The ramp is also bounded by a concrete edged planting strip that follows the ramps contours. Building 2's south façade is primarily paved walkways with brick strips, but narrow planting strips with low-profile shrubs are set against the façade and a curvilinear brick masonry mechanical screening wall.

Between Building 2's L-shaped brick wing and the Music Building (Bldg. 4) is an open concrete paved patio space and rectilinear planting strips next to the brick wing with semi-tropical plantings of mixed-profiles bounding separating hardscape elements from the building.

Building 4's west and south façade feature a series of rectilinear planting strips. At the base of the building is a strip of gravel with wood edging. Between the gravel strip and the surrounding parking lots and walkways are a mix of low-rise shrubs, mulch top cover, and some semi-tropical plantings. Large Eucalyptus trips are spaced regularly within the planting strips along the west façade.

Buildings 35, 36, 37, 38, 39 | Math and Planetarium Complex

The Math and Planetarium complex, originally the Science Building, is a collection of five buildings located towards the western end of the Historic District. Covered walkways connect the buildings, with Buildings 35 and 36 on the north side and Building 37, 38, and 39 on the south side. A covered breezeway separates Building 35 to the east and Building 36 the west; the covered walkway extends into the breezeway and out south toward Building 37. The complex is on the diagonal orientation intended for the classroom buildings.[5]

Figure 1C-66: East façades of Building 35 (right) and 37 (left background), looking west. The armillary sphere sculpture is in the foreground.

Bldg.	Year Completed	Original Name	Architect	Landscape Architect
35	1957	Science Bldg.	Neutra and Alexander	Eckbo, Royston & Williams
36	1957	Science Bldg.	Neutra and Alexander	Eckbo, Royston & Williams
	1960 addition	Science Bldg. Addition	Pleger, Blurock, Hougan, Ellerbroek	Eckbo, Royston & Williams
37	1957	Science Bldg.	Neutra and Alexander	Eckbo, Royston & Williams
38	1960	Science Bldg. Addition	Pleger, Blurock, Hougan, Ellerbroek	

[5] As per the original plans for the diagonally oriented buildings, this report considers the northeast-facing façade as plan north or north.

39	1957	Planetarium	Neutra and Alexander	Eckbo, Royston & Williams
	1972 addition		William Blurock & Partners	
	1994 addition		Hill Partnership

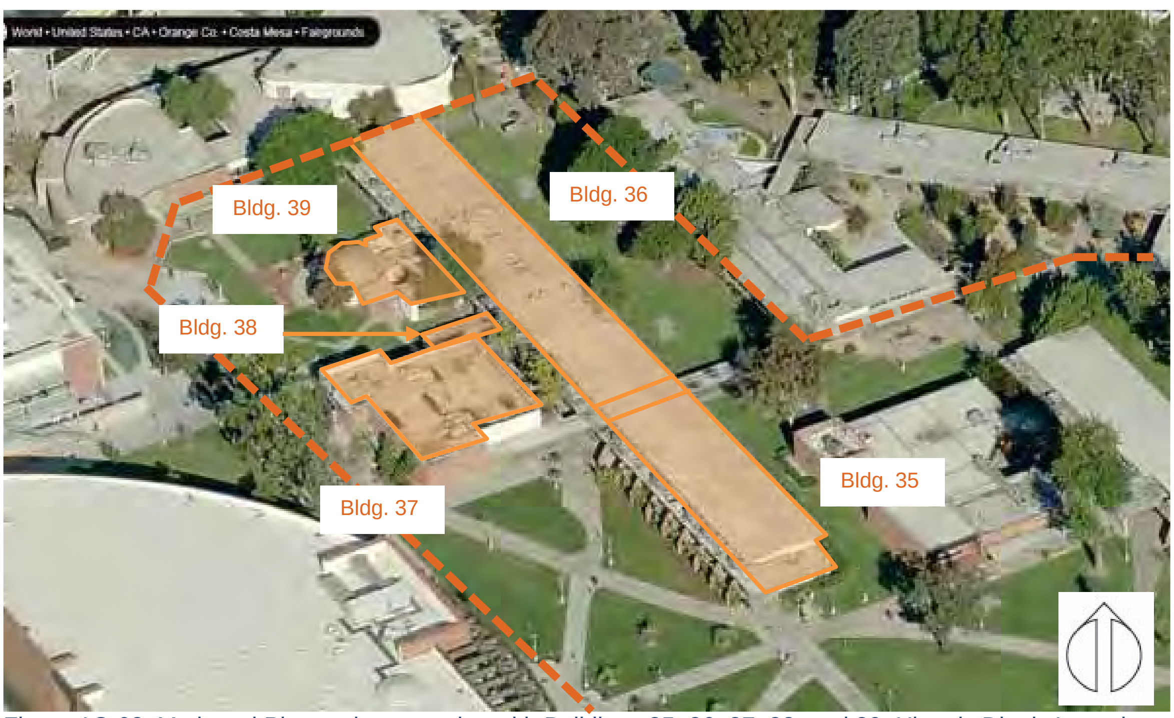

Figure 1C-68: Math and Planetarium complex with Buildings 35, 36, 37, 38, and 39. Historic District's north and west boundaries are dashed above. Source: Bing Maps, edited by Page & Turnbull, 2015.

Buildings 35 and 36: Math Wings

Figure 1C-69: Building 36s west end wall with the tapered aluminum section transitioning to the building's angled north glazed wall.

Exterior

Buildings 35 and 36 are single-story, wood-framed buildings on caissons that are similar in design, materials, and construction (Figure 1C-69). The two rectangular buildings share a membrane-covered side-gabled roof that covers the breezeway separating the two buildings (Figure 1C-72). Building 36, on the west side of the covered breezeway, is longer than Building 35. Eaves with tongue and groove wood soffits overhang on both sides of the roof. The buildings share a covered walkway along their plan south facades that is supported by diagonal reinforced masonry wing walls at Building 35. A one-story wing is at the east end of Building 35 that is lower than the main building and has a flat roof integrated with the walkway canopy which wraps around to the plan east side of the addition.

The buildings are clad primarily in stucco. The principal façades (plan south) of both buildings are stucco with occasional door openings to access individual classrooms (Figure 1C-70). A freestanding brick wall with added attachments is in front of Building 36 in the covered walkway. A band of clerestory windows and stucco panels is above the covered walkway roofline and partially obscured or infilled by HVAC equipment.

The north façades of Buildings 35 and 36 are aluminum-framed windows on a low brick wall. The window wall angles from the bottom out while the brick wall is perpendicular to the ground.

Toward the west end of Building 36 are two stucco panels in place of two window bays (Figure 1C-71). The north façade of Building 35's end wing is stucco with no openings.

Figure 1C-70: Typical south façade of Building 36 showing the clerestory windows, stucco panels and HVAC units mounted on the walkway canopy.

Figure 1C-71: North façade of Building 36 with two stucco panels in the glazed wall marking the later addition.

Both buildings' east and west façades are stucco with no openings (Figure 1C-69). Tapered aluminum-clad section is at the north end to transition to the north façade's angled window wall. The east façade of Building 35's end wing is clad in painted plywood with a low stucco wall below three window openings (Figure 1C-66). A single-leaf wood door is at the north end.

Windows are primarily aluminum throughout. The north façades have alternating pairs of windows: one set that are two-lite fixed glazing with a taller upper lite and one set of four-lite awning and fixed windows. The windows are on concrete sills and typically have clear glazing. The south façades have fixed and jalousie clerestory windows. The fixed glazing has been painted on the interior and some jalousie windows removed for HVAC equipment. Clerestory windows are also at the south side of the breezeway above the intersecting covered walkway and are fixed. Three vinyl sliding windows are on Building 35's end wing east façade.

Doors along both buildings' south façades are wood with wood frames. Classroom doors have vertical single-lite view windows of tempered glass and non-original lever handles. Other doors for offices and labs have no glazing. Painted plywood cladding surrounds some doorways (Figure 1C-73). Individual black metal lettering for "MATH WING" are on Building 35's east façade and Building 36's west façade; the lettering is different sizes at each façade.

Figure 1C-72: Breezeway between Buildings 35 (left) and 36 (right) towards Building 37. Clerestory windows are present between the walkway canopy and breezeway roof on south façade.

Figure 1C-73: Typical plywood surrounds around some doorways in Building 35 and 36. Note the wide board and batten ceiling of the covered walkway.

Interior

Buildings 35 and 36 house classroom and office spaces (Figure 1C-74). Building 35 has four classrooms with an office and prep/ lab storage area between the two west classrooms. Original wood veneer built-in cabinetry remains in one prep/lab storage area (Figure 1C-75). Two offices and storage are in the building's east end wing. Building 36 has six classrooms with office and lab storage areas between and shared by pairs of classrooms. The classroom interiors have plaster walls and carpet flooring. There is a structural I beam running continuously down the roofline at the center of both buildings. Acoustical tiles are adhered to the ceilings.

Figure 1C-74: Typical classroom in Building 35 and 36. Note the original internal doors and I beam and attached acoustical board tiles at the ceiling.

Figure 1C-75: Room 150 Building 35. Prep/storage area between classrooms with intact wood veneer paneling.

Building 37: Reprographics

Exterior

Building 37 is a tall one-story, reinforced masonry and wood-framed building on caissons (Figure 1C-76). It is roughly square in plan structure and clad primarily in brick, stucco and painted plywood. The building has a flat roof with parapet wall, accessible as an observation deck from exterior stairs on the east façade. The roof and inner parapet walls have a membrane coating.

Figure 1C-76: South façade of Building 37. At the right is the east façade with exterior stairs to the roof-top observation deck.

The south façade is two volumes and primarily brick. The east volume has a band of aluminum-framed windows behind aluminum louvers and a stucco panel above. The west volume has a canopy at a roll-up door and a fabric awning above a pay telephone. The north façade is stucco-clad with the upper half of the façade set back (Figure 1C-77). There are two doors and a band of vents leading to a mechanical room.

Figure 1C-77: Building 37's north façade along the covered walkway.

The east façade has two volumes, with the south volume clad in brick and the north volume in stucco (Figure 1C-78). The brick volume has a set of concrete stairs with metal railings leading up to the roof observation deck secured by a metal gate. An extended brick wall partially screens the exterior stair. Below the stairs and concealed by the extended brick wall is a set of concrete stairs leading to an interior classroom. At the stucco volume, the covered walkway extending from the breezeway bisects the façade with door and window opening below the walkway canopy. Toward the north end is the door and clerestory windows for the men's restroom and toward the south is a band of windows above a stucco wall and an entry door surrounded by painted plywood. In the brick volume's return is a door with a wide, full-height sidelite.

Figure 1C-78: East façade of Building 37 with covered walkway connecting to the breezeway between Building 35 and 36, looking west.

Similar to the east façade, the west façade also has two volumes with the south volume clad in brick and the north half in stucco (Figure 1C-79). A covered walkway extends perpendicularly from Buildings 35 and 36's south covered walkway and bisects the stucco volume (Figure 1C-85). Under the covered walkway is a band of windows as well as the door and clerestory windows for the women's restroom. Next to the band of windows is painted plywood cladding around two doors to the south; a third door surrounded by plywood is in the return of the brick volume.

The windows on the east and west facades are fixed wood framed windows. The windows on the south façade are aluminum framed, set behind louvres (Figure 1C-80). All the doors are wood with vertical side glazing in the upper half except for the restroom doors which have a lower vent and no glazing.

Lettering attached to the plan west brick façade says 'GEORGE HOAG FAMILY FOUNDATION.' Lettering attached to the plan east painted plywood says 'REPROGRAPHICS.'

Figure 1C-79: West façade of Building 37 with Building 38 at the left.

Figure 1C-80: West (left) and south (right) façade of Building 37. Note the aluminum louvers screening clerestory windows on the south façade. The stucco south façade of Building 38 is also visible at the left.

Interior

The Reprographics Building (Bldg. 37) houses two classrooms in the southeast and southwest corners of the building with a service room between. The classrooms and office have painted brick walls, suspended acoustical tile ceilings and carpeted floors. In the classroom in the plan southeast corner of the building, steps lead up to an external exit (below the exterior stair on the east façade) that remains from when the classroom had a tiered floor (Figure 1C-81). The classroom at the southwest corner has an at-grade exterior entry door and an attached office. The suspended ceiling in the room hides the clerestory louvered windows on the south façade.

Figure 1C-81: Southeast classroom of Building 37 with stairs leading to the east exit below the exterior stairs.

At the center of the building there are two large reprographics rooms connected by a service room with partial glazing on both sides (Figure 1C-82 and Figure 1C-83). These rooms have painted walls, carpeted flooring, and suspended acoustical tile ceilings. Exterior doors access each of the space from the east and west.

The service room between the classrooms has an exposed concrete slab floor, brick walls, and has external access from roller door on the south façade. It retains several areas of original wood veneer finishes including book-match paneling, fire hose housing, and an integrated built-in cabinetry. At the northeast and northwest corners of the building are the men’s and women’s restrooms that serve the complex.

Figure 1C-82: A large, open space reprographic area in Building 37.

Figure 1C-83: Glazed service room between the two reprographic areas in Building 37.

Building 38

Building 38 is a small one-story, rectangular plan building with a flat roof (Figure 1C-84). It is across covered walkways from the south façade of Building 36 and the west façade of Building 37. The building has stucco finished walls with three wood doors on the east façade leading into individual offices (Figure 1C-85). The west façade has six aluminum-framed sliding windows above a stucco wall. Its north and south facades are stucco with no openings.

Figure 1C-84: View along Buildings 35 and 36's south covered walkway facing east with Buildings 38's stucco north façade and glazed west façade. Just visible in the background is the north façade of Building 37.

Figure 1C-85: Building 37's west façade along the covered walkway with door to the southeast classroom at the background. Building 38's east façade is at the right. The walkway with the tongue-and-groove ceiling is perpendicular of Building 35 and 36's south façade walkway.

Building 39: Planetarium

The Planetarium (Bldg. 39), across the covered walkway from Building 36, is irregular in plan and composed of two main wings: a round concrete section that is a planetarium/classroom, and a series of one-story rectangular volumes that surround the domed section on the north and east (Figure 1C-86). As viewed from the covered walkway, Building 39 is a stucco-clad wall with a chair-rail height reveal and one painted brick section.

Figure 1C-86: Planetarium (Bldg. 39) at left with Building 36 in the background and Building 38 to the right. The west façade of Building 37 is at the right edge.

Exterior

The circular domed wing is toward the south. It has poured-in-place concrete walls with a ribbed texture created by tongue-and-grove board forms. The concrete dome clad in copper panels is setback from the circular building. Around the edge of the dome is a narrow flat roof with a membrane cover and internal drainage toward the north. Squared downspouts are attached to the concrete walls toward the south. There are no external entrances or fenestration on this part of the building.

The one-story section is comprised of several additions with flat membrane-covered roofs. Only two sections are attached to the domed planetarium. To the north is a narrow, rectangular wing that is part of the original construction. It is brick clad on the west and north (at the covered walkway) and stucco at the east façade facing an interior courtyard. The only opening is on the painted brick north façade with a projecting door that is the main entrance into the planetarium classroom from the covered walkway (Figure 1C-87).

Attached to the east of the planetarium is a mostly square wing clad in red brick on its east and south façades. Its west façade in the interior courtyard is stucco (Figure 1C-88). The only opening is a door on the east façade as a secondary entry for the planetarium/ classroom. This façade also has attached lettering at high level for ‘PLANETARIUM’.

Figure 1C-87: North façade of the Planetarium (Bldg. 39) below the covered walkway.

Figure 1C-88: Planetarium (Bldg. 39) viewed from the east. Note the east massing and the east façade of the L-shaped wing.

Connecting the attached north and east wings is an L-shaped wing that creates a small internal courtyard. This wing has a flat roof with membrane cover and deep overhangs into the courtyard. The walls have a stucco finish on the north façade along the covered walkway (west of the brick north façade of the planetarium entry) as well as at the south façade and in the facades of the interior courtyard. Its east façade is stucco with a band of dark aluminum clerestory windows above a red brick wall. There are two entrance doors on the north façade below the covered walkway. Within the courtyard there are two doors, a wood door on the north side and a metal roll-up door on the east side.

A small rectangular addition is attached to the west of the north attached volume. Its stucco-clad north façade with the reveal is west of the brick entryway to the planetarium under the covered walkway. It has a flat roof, higher than the other flat-roofed structures of Building 39, and stucco walls. There is one door entry on the north elevation and a skylight in the center of the roof. A wood board fence encloses a service yard between this addition and the circular planetarium (Figure 1C-89).

Figure 1C-89: Planetarium's west façade, with the mechanical room addition to the left and the enclosed service area in center.

Interior

The planetarium classroom in the circular domed wing building of Building 39 has painted paneled perforated wood walls and the inside of the dome is plastered. The floor is a concrete slab with carpet cover and a raised tier around the edge at the back of the classroom. Around the base of the dome there is a ledge for concealed lighting and electric cabling. There are two original wood doors leading to the main (north) and secondary (east) entries.

The rectangular volume attached to the north of the planetarium classroom provides access along a corridor from the door in the covered walkway. The corridor is brick clad matching the exterior walls, with the curved concrete textured wall of the planetarium at the south end. There is an internal storage room in this corridor. Original built-ins, including a display case and wood-paneled duct covers, are present. The transom above the north entry door is wood veneer paneling.

The rectangular volume attached to the east of the planetarium classroom provides exit access along a corridor from a door on the east façade. There is also an internal storage room in this space and the curved concrete external wall of the planetarium classroom is also visible.

Figure 1C-90: Planetarium Classroom Interior, Building 39.

The L-plan structure has two laboratory spaces connected by north-south double glass doors. Both rooms have a tile wainscot with gloss painted upper walls and ceiling and a tile floor. This room is accessed by two doors, one into each lab space, to the north side from the covered walkway. There is also access to the courtyard from each room, one wood door and one metal roll-up door.

The small rectangular wing to the north of the planetarium's entry corridor is a mechanical room with a concrete slab floor, painted walls and ceiling, and a center skylight. It has an external access door to the north leading to the covered walkway.

Covered Walkways

A wood-framed covered walkway is between Building 35 and 36 at the south and Buildings 37, 38, and 39 at the north. The covered walkway is supported by rounded metal posts toward the west (between Bldgs. 36, 37, 38, and 39) and oblique angled brick wing walls at the east in front of Building 35. The ceiling is wide board and batten. HVAC equipment and ducts that run through and obscure Building 35 and 36's the clerestory windows are on the walkway's roof.

Two covered walkways are perpendicular to the above. One intersects the breezeway between Buildings 35 and 36 and extends along the east façade of Building 37. Clerestory windows are between the canopy and the breezeway roof. The other extends along Building 37's west façade from where the stand-alone brick wall is in front of Building 36. The ceilings of these covered walkways are tongue-and-groove wood.

A later covered walkway extends north from the breezeway between Buildings 35 and 36.

Figure 1C-91: Intersecting covered walkway in breezeway. Note the different ceiling treatments and the clerestory windows.

Figure 1C-92: Covered walkway along the south façade of Building 36 looking west. Note the intersecting roof at the brick wall extending south along Bldg. 37's (left) west façade.

Landscape

Open space inscribed by buildings is to the southeast, north, and southwest of the complex. At the southeast is a rectangular, turf quad with Building 35 and its oblique brick wing walls at the northern edge and Building 37 at the western edge. The gaps between the wing walls feature low-profile palms, birds of paradise, and mulch top soil. The quad is crisscrossed with pathways in an X-pattern and a few small new palm trees have been added. A patio space is at the northwest corner that opens up from the breezeway and covered walkways at the intersection of Buildings 35, 36, and 37. Set in the center of the patio space is a series of circular concrete paving, indicative of a planter that was original to the space. Currently aluminum picnic tables are in the space (Figure 1C-93).

Figure 1C-93: Expansive quad south of Building 35 (with brick wing walls) with X-pattern walkways. Note the patio area between Building 37 (left) and Building 35 with circular concrete paving.

North of Buildings 35 and 36 are grassy courtyards between buildings. At Building 35, the courtyard is less expansive with Building 14's large addition occupying much of the space. The lawn extends around Building 35's east façade to the armillary sphere sculpture and the two wood benches at the set around the sculpture. A long, rectangular expanse is between Building 36 and the Journalism Building (Bldg. 72) with a few mature trees (Figure 1C-94). A narrow planting strip is at the base of both Building 35 and 36's north facades with low-profile shrubs, aloe plants, other succulents, exposed top soil and a single large tree at Building 36 near the shared breezeway. Further west of Building 35 is a large open quad between the new Library (Bldg. 182) and Building 12 of Business Education with crisscrossing X-pattern pathways.

Figure 1C-94: Grassy courtyard between Building 36 (right) and the Journalism Building (Bldg. 72) at left, looking east.

Figure 1C-95: Open space surrounding the Planetarium (Bldg. 39) with the Reprographic Building (Bldg. 37) at right, looking southeast.

At the complex's southwest corner is open space with Building 36 at the north, Building 37 at the east, the Science Hall (Bldg. 40) and Math Lecture Hall (Bldg. 41) at the west (outside the Historic District boundaries) and the Lewis Center for Applied Sciences (Bldg. 42) at the south (also outside the Historic District). The Planetarium (Bldg. 39) extends into the open space, which is a mix of lawns, paved patios, and circulation paths (Figure 1C-95). West of the Planetarium is a large lawn between it and the Science Hall (Bldg. 40) and Math Lecture Hall (Bldg. 41); a mature tree is in the lawn. East of the Planetarium is a small lawn between it and Building 38; a mature tree is here near Building 36's covered walkway.

Around the Planetarium's southwest quadrant is a patio that has a quarter-circle concrete paving following the contours of the Planetarium's curved façade. This mimics a reflecting pool that was part of the original landscape, but has since been removed. Around the concrete is brick paving. Concrete and wood benches and aluminum picnic tables are in this patio area. Further south are lawns and a network of walkways bounded by low concrete walls extend through the lawns.

Building 37's rear (south) façade faces onto a major axial pathway. An irregularly shaped planting strip is toward the east end with low-profile shrubs, simple ground covering, and two medium-profile trees. The building's north façade is defined by the covered walkway shared with Building 36's south façade. Small rectilinear gravel-filled strips are set between the covered walkway and the north façade of Building 37, which are separated by extended walkways to entrances.

Building 93 | Swimming Pool complex

The Swimming Pool complex (Bldg. 93) is at the northeast corner of the campus in the athletics area (Figure 1C-96). There are two swimming pools oriented north-south with concrete bleachers on the west side of the pool facing east. Below the bleachers is the mechanical room for the pool filters and equipment.

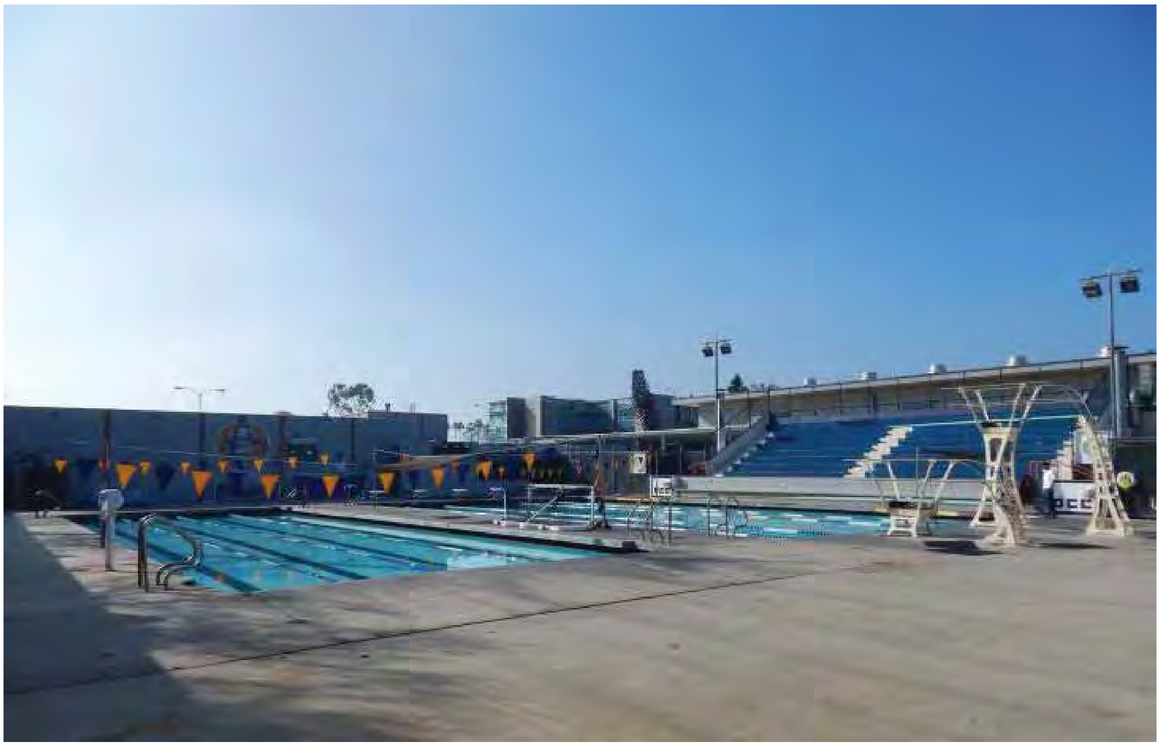

Figure 1C-96: Swimming Pool complex with the two pools in the foreground and bleachers to the back right, looking southwest.

Bldg.	Year Completed	Original Name	Architect	Landscape Architect
93	1954	Swimming Pools	Neutra and Alexander	Eckbo, Royston & Williams

Swimming Pools

The two pools are equal in length, approximately 75-feet long. The east swimming pool is the smaller of the two pools. It is narrower at about 24 feet wide and shallower at three and a half to four feet deep across its length. The west swimming pool is wider at approximately 44 feet wide. It is six feet at its shallow end toward the south and about 12-feet deep at its north end for diving.

Figure 1C-97: OCC Historic District key plan with the discontiguous Swimming Pool (Bldg. 93) highlighted. Source: Bing Maps, edited by Page & Turnbull, 2015.

Figure 1C-98: Swimming Pool complex (Bldg. 93) surrounding by the Gymnasium (91) to the west, Men's Locker Room (Bldg. 96) to the north and Women's Locker Room (Bldg. 93) to the south. Source: Bing Maps, edited by Page & Turnbull, 2015.

The pools are poured concrete bottoms with a recent plaster finish. They have tiled edges as well as black tile lane lines at the bottom and targets at pool ends. Both pools have deep integrated gutters at all sides below the non-original concrete paving. The smaller east pool has four lanes while the larger west pool has six lanes. Two diving boards of different heights are at the north end of the larger west pool, with smaller starting platforms at the south end. The metal diving boards replaced the original concrete diving boards during a 1992 renovation.

The swimming pool area is bounded on its north and south sides by the Men's (Bldg. 96) and Women's (Bldg. 92) Locker Rooms. At its east side is a tall brick wall with an integrated concrete bench marking the campus boundary along Fairview. At the west end is a concrete masonry unit (CMU) low wall with an integrated concrete bench (Figure 1C-99). At each end of the CMU wall is a tiled pony wall with a drinking fountain and black tiles forming "OCC" lettering. Chain-link fencing and gates encloses the pool area at the west end.

Figure 1C-99: Pool bleachers with CMU wall at its base, looking northwest.

Figure 1C-100: Sculptural concrete pier in the mechanical room below the bleachers.

Bleachers

The concrete bleachers are west of the larger pool behind the CMU wall (Figure 1C-99). It is poured-in-place concrete with a smooth finish and some painted areas. The concrete seating rows are topped with plastic bench seats. There are three stair aisles, one each at the north and south end and one in the middle. Wood board fencing with a metal top rail are at the north and south ends of the bleachers topped with chain link fencing, which also run along the top of the bleachers. Side stairs at the north and south ends with square metal railing provides access to the bleachers.

Three large sculptural concrete piers support the upper part of the bleachers and create space for mechanical and pool equipment below the bleachers (Figure 1C-100). There is an upper and lower levels mechanical space separated by chain link fencing. The underside of the bleachers and the concrete piers have a board-form finish showing the wood grain of the forms. Large metal exhaust pipes rise to the north and south of the bleachers.

The stucco-clad rear wall of the bleachers encloses the mechanical spaces and creates a solid wall along the covered walkway shared with the Gymnasium (Bldg. 91). A pair of large doors are along this blank wall to access the mechanical spaces.

Building 105 & 110 | Stadium and Field House

The LeBard Stadium (Bldg. 105) and Field House (Bldg. 110) are in the athletic section of OCC campus in the northeast corner. The Field House serves the Stadium and is located at its southern end. The Track is east of the Stadium and a Fitness Complex is to the north. West of the Stadium is the Adams parking lot. South of the Stadium and Field House is an open lot on which a new classroom building is under construction.

Figure 1C-101: LeBard Stadium with below grade field, east (left) and west (right) bleachers, looking south toward the Field House.

Bldg.	Year Completed	Original Name	Architect	Landscape Architect
105	1955	Stadium	Neutra and Alexander	Eckbo, Royston & Williams
110	1955	Field House	Neutra and Alexander	Eckbo, Royston & Williams

Figure 1C-102: OCC Historic District key plan with the discontiguous Stadium and Field House (Bldgs. 105 and 110) highlighted. Source: Bing Maps, edited by Page & Turnbull, 2015.

Figure 1C-103: LeBard Stadium (Bldg. 105) and Field House (Bldg.110). Source: Bing Maps, edited by Page & Turnbull, 2015.

Building 105: LeBard Stadium

Oriented north-south, the Stadium consists of a below-grade football field with berms to the east and west in to which concrete bleachers are built; the east berm's east side also supports smaller bleachers for the track to the east (Figure 1C-101). The bleachers curve slightly to give the Stadium a bowl effect and improve sight lines. Low, poured-in-place concrete walls create planters and a southern end to the Stadium that is broken for a vehicular access ramp from grade to the field (Figure 1C-105). The north end has a low berm with two sets of concrete stairs. Disabled access ramps with concrete masonry unit walls extend to the field at the north and south ends.

The east (home stand) bleachers are wider with five seating sections divided by four stair aisles as well as end aisles (Figure 1C-104). The west (visitor) bleachers are smaller with three sections divided by two stair aisles and aisles at each end. The north and south sections have a cross aisle not quite half way up. Metal pipe hand rails are centered along each stair aisle. The ends of the bleachers have chain link fencing while the top is a concrete wall. A concrete wall separates the bleachers from the lower field. The bleachers have aluminum metal bench seats.

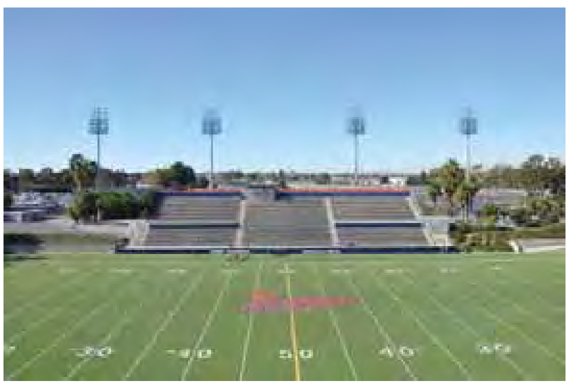

Figure 1C-104: East "Home" bleachers extending up into the berm with light stations in the background, looking east.

Figure 1C-105: South end of the Stadium showing grade transition and vehicle ramp, looking southeast.

A press box is at the top of each bleacher. The east press box is larger, original to the Stadium, and spans across the center seating section. It is rectangular in plan with a flat roof and deep overhang that is also an observation/camera deck. The roof deck has non-original metal railing and is accessed from a ladder on the press box's south façade and by a set of non-original stairs at the north end. The overhang shelters the west façade overlooking the field and has a wood trellis extending at the south end. The north half of the west façade is glazed that cants out toward the field while the south half is two open bays without glazing. Below the openings is a Flexboard fascia that also extends to the south like the trellis. Flexboard is a particleboard material. The press box door is at the south façade, where a ladder provides access to the roof deck and poured-in-place concrete steps leads to the door. A set of stairs added to the north façade also access the roof deck.

Figure 1C-106: East press box with canted glass, extended trellis, and Flexboard fascia, looking north.

The press box centered at the top of the west bleachers is smaller and in the southern corner of the central seating section. It is also rectangular in plan with a flat roof and overhangs but is simpler than then east press box. It is partially glazed on the west façade facing the field and does not have a roof deck. Landscaping and trees are at each corner of the Stadium on the berms and at the north and south ends.

Building 110: Field House

The Field House is a one-story, rectangular building with a flat, wood-rafter roof that creates deep overhangs around most of the building (Figure 1C-107. The overhangs have exposed rafters and a box eave. The foundation is concrete slab on grade while the building is wood-framed with alternating areas of stucco, plywood, and Flexboard and batten cladding. The Flexboard panels have an aluminum-framed hopper window at the top of each board.

Figure 1C-107: South façade of Feld House (Bldg. 105).

Figure 1C-108: North and east façade of Field House with deep roof overhang, looking southwest.

The north façade facing the Stadium is mostly Flexboard and batten with two sets of non-original entry doors toward the center (Figure 1C-108). Stucco walls toward the east and west ends mark and conceal restroom entrances and divide the concession areas at the far east and west ends from the rest of the building. The concession areas have lift-up plywood boards securing the sales areas above Flexboard and batten.

The south façade has a projecting, stucco-clad middle section as well as stucco wall screening a restroom entrance toward the west end. An L-shaped brick wall toward the east side screens two doors. Altered ticket areas toward the east and west ends project from the building façade and are stucco with dark glazing. At the south side of the Field House is a lawn with mature trees.

Figure 1C-109: Concession area on the west façade, looking east.

Figure 1C-110: Entrances and L-shaped brick screening wall at North Façade, looking northeast.

Original wood doors are found throughout the building. Non-original windows with dark glazing are in some of the stucco walls. The building is currently used as offices and storage and have drywall partitions. The ceiling is exposed wood rafters with V-joint tongue and groove diagonal wood boards. The flooring is mostly carpeting and concrete though some of the original tile flooring remains from the original locker room and shower uses.

Armillary Sphere Sculpture

The armillary sphere sculpture by Peterpaul Ott is a freestanding sculpture set directly southeast of Building 35 on a square concrete pad (Figure 1C-111). A medieval device that modeled and mapped astrological elements and events, the armillary sphere is a large, open metal sphere made of two large and two small concentric rings. The sculpture is set on a stepped rectilinear concrete plinth. The south and east facing sides of the plinth feature bas-relief engravings showing abstracted and expressionist scientific instruments. The north and west facing sides of the plinth are flush concrete, although the north facing side has a small outwards step near the base. Set into this base is a bronze plaque that reads “O.C.C. Survey BM1 1956.” It does not appear the sculpture has a formal name.

Figure 1C-111: Armillary Sculpture in the foreground with Building 35 directly behind.

Contributing Landscape Features

The primary landscape features that remain from the Historic District's period of significance are the pedestrian circulation pattern, the open spaces between buildings, and the patios and courtyards at each complex in the central core of the District.

The circulation pattern is dominated by a diamond-shaped grid that is a result of the classroom complexes placed at a 45-degree angle to capture natural daylighting from two façades while protecting the buildings from prevailing winds. The major walkways are wide, straight paths that run through the classroom complexes at breezeways or patios between the linear bar classroom buildings. Secondary pathways crisscross the expansive diamond-shaped open space created by the walkways in X-patterns. These secondary pathways are more informal with curves, narrow and wider points, and irregular-shaped intersections where they cross the major walkways. Other secondary pathways also exist in the Historic District with varying patterns, locations, and sizes. At the south and east border of the diamond grid are broad axial walkways lined by mature trees in some areas. These broad walkways run orthogonally and transition from the classroom area to other parts of the campus. The circulation paths in the Historic District are typically poured concrete paving with no bordering material.

The circulation pattern defines the open space in the Historic District along with the buildings. There are the expansive lawns in diamond or triangle shapes crisscrossed or bisected by pathways. Buildings anchor these sprawling spaces at one or two edges to avoid an uncomfortable openness but they are low-scaled and blend into the landscape with integrated features such as the brick wing walls of Buildings 12 and 35 and the north window walls at Buildings 8 and 9. These spaces are typically grass ground cover with concrete paths and occasional trees. Most notable is the cluster of mature palm trees at the Historic District's eastern edge near the Student Success Center and Classroom & Labs complex (Bldgs. 7, 8, and 9).

Between the three classroom complexes are also diamond-shaped spaces that are infilled with buildings and smaller open spaces. These spaces are more intimate with buildings on two to three sides. The spaces here also typically have grass as ground cover with scattered trees. Because the complexes are staggered, one-half of each complex relates to different, neighboring complexes. The staggering is most notable in the spatial relationship between Building 35 and Building 12 where their brick wing walls create a dynamic interplay across the campus.

Each of the complexes in the core of the Historic District has patios and courtyards that are described with the complex.

Historic District Non-Contributors

Non-contributors that are not described elsewhere include the Special Services Building (Bldg. 10) and Faculty House (Bldg. 11). The Special Services Building (c. 1975) is a one-story, flat-roof building with an irregular plan (Figure 1C-112). It is clad with concrete masonry units and bisected by a circulation path at its entrance. It has dark aluminum windows with tinted glazing and its own landscaping.

Figure 1C-112: The Student Service Center constructed after the period of significance.

The Faculty House (Bldg. 11) is a one-story Ranch-style building that resembles a residence (Figure 1C-113). It is L-shaped in plan with side-gabled roofs and stucco walls. It has a brick chimney that no longer extends much above the roofline. Constructed in 1957 during the Historic District's period of significance, it was designed by a graduate of OCC (Rodney Lauter) and constructed by the Building Trades class, and is not associated with the Neutra and Alexander development on campus.

Figure 1C-113: The Faculty House (Bldg. 11) built during the period of significance but not designed by Neutra and Alexander.

Surrounding Context

The core of the OCC Historic District is surrounded by academic and administrative buildings developed after 1957, the end of the period of significance. North and west of the Historic District are one- to two-story buildings constructed between 1958 and 1965 that are oriented east to west and used for classroom, lecture hall, and student services like bookstore and computer center. These buildings create a north edge to the campus center and divide it from the athletic facilities.

Figure 1C-114: Computing Center (Bldg. 73, 1963) north of the Historic District, looking east.

Figure 1C-115: The Forum (Bldg. 81, 1960), northeast of the Historic District, looking west. C&L (Bldg. 9) in the Historic District is to the left.

Figure 1C-116: Journalism (Bldg. 72, 1958) and Writer's Row (Bldg. 71, 1958, right) adjacent to the northwest corner of Historic District boundaries, looking northwest.

As they were constructed directly after the initial campus development and by architects associated with the original construction (Richard Pleger and Robert E. Alexander), they share features with the historic buildings, such as covered walkways and similar materials (Figure 1C-114 though Figure 1C-116). However, they are distinctly different from the initial construction and reflect changes in construction methods, materials, and programmatic needs from the late 1950s and early 1960s. Additional multi-story classroom buildings from the 1970s are north of the 1960s buildings.

South and east of the Historic District's broad orthogonal walkway boundaries are the buildings used by all campus groups– Library (Bldg. 182), Theater (Bldg. 2, in the Historic District), Administration (Bldg. 1), Student Center (Bldg. 86) and Art Center and Arts Pavilion (Bldgs. 158 and 180) (Figure 1C-117 to Figure 1C-119). Because these buildings often interact with the broader community, they generally have parking lots on their other side toward Fairview Road and Merrimac Way. The Student Center (Bldg. 86) to the east was designed by Neutra and Alexander and built within the Historic District's period of significance. However, it has been substantially altered and was excluded from the Historic District. The other buildings are from later in the campus' development, such as Administration (Bldg. 1) and Fine Arts Lecture Hall (Bldg. 5) from the 1970s as well as larger-scale, more recently constructed buildings, including the current Library (Bldg. 182, 2008) and Arts Center (Bldg. 158, c.2002) that were constructed on the sites of the former Technology Building and original Fine Art center from the initial campus development.

Figure 1C-117: The altered Student Center (Bldg. 86, 1953, altered ca. 1992) and Administration (Bldg. 1, ca.1975) east of the Historic District, looking north.

Figure 1C-118: Library (Bldg. 182, 2008) south of the Historic District, looking southeast. The Historic District's Planetarium (Bldg. 39) is in the foreground.

PAGE INTENTIONALLY LEFT BLANK

1D. EVALUATION OF SIGNIFICANCE

This section typically includes a statement of significance that summarizes the historic importance of the historic resource—the Orange Coast College (OCC) Historic District in this case—and documents the relative zones of its significance to aid in developing appropriate treatments. However, Page & Turnbull was asked to review a previous historic evaluation by Ostashay & Associates and conduct additional research as needed to confirm their findings as part of preparing this Historic Structures Report (HSR). Based on supplemental research and analysis, Page & Turnbull identified a smaller historic district with a narrower period of significance and fewer contributors than the previous evaluation. As such, Page & Turnbull evaluated the redefined OCC Historic District (Historic District) for listing in the National Register of Historic Places (National Register) and California Register of Historical Resources (California Register). Also in this section are the character-defining features of the OCC Historic District as identified by Page & Turnbull and significance diagrams illustrating the relative zones of significance in the Historic District.

National Register of Historic Places

The National Register of Historic Places (National Register) is the nation's most comprehensive inventory of historic resources. The National Register is administered by the National Park Service and includes districts, sites, buildings, structures and objects significant in American history, architecture, archeology, engineering, and culture. These resources contribute to an understanding of the historical and cultural foundations of the nation at the national, state, or local level. Typically, properties over fifty years of age may be eligible for listing in the National Register if they meet any one of the four significance criteria and if they retain sufficient historic integrity to convey that significance. However, properties under fifty years of age may be determined eligible if it can be demonstrated that they are of "exceptional importance." Other criteria considerations apply to cemeteries, birthplaces, graves of historical figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed buildings, and properties primarily commemorative in nature. National Register criteria are defined in depth in *National Register Bulletin Number 15: How to Apply the National Register Criteria for Evaluation.*

Historic Significance

The National Register has four basic criteria under which a property may be considered eligible for listing. It can be found significant under one or more of the following criteria:

> Criterion A (Event): Properties associated with events that have made a significant contribution to the broad patterns of our history;
>
> Criterion B (Person): Properties associated with the lives of persons significant in our past;
>
> Criterion C (Design/Construction): Properties that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or

that possess high artistic values, or that represent a significant distinguishable entity whose components lack individual distinction; and

Criterion D (Information Potential): Properties that have yielded, or may be likely to yield, information important in prehistory or history.

A property may be considered significant on a national, state, or local level to American history, architecture, archaeology, engineering, and culture.

Integrity

In addition to qualifying for listing under at least one of the National Register criteria, a property must be shown to have sufficient historic integrity in order to be considered eligible for listing in the National Register. The concept of integrity is essential to identifying the important physical characteristics of historic resources and hence, in evaluating adverse changes to them. Integrity is defined as "the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance." For historic districts to retain integrity as a whole, the majority of the components that make up the district's historic character must possess integrity. In addition, the relationships among the district's components must be substantially unchanged since the period of significance.[1]

According to the *National Register Bulletin Number 15: How to Apply the National Register Criteria for Evaluation*, these seven aspects are generally defined as follows:

Location is the place where the historic property was constructed.

Design is the combination of elements that create the form, plans, space, structure and style of the property.

Setting addresses the physical environment of the historic property inclusive of the landscape and spatial relationships of the building/s.

Materials refer to the physical elements that were combined or deposited during a particular period of time and in a particular pattern of configuration to form the historic property.

Workmanship is the physical evidence of the crafts of a particular culture or people during any given period in history.

Feeling is the property's expression of the aesthetic or historic sense of a particular period of time.

[1] National Park Service, *National Register Bulletin Number 15: How to Apply the National Register Criteria for Evaluation*, (Washington D.C.: National Park Service), 46.

Association is the direct link between an important historic event or person and a historic property.

Integrity is a "yes" or "no" determination. A historic property either has adequate integrity, or it does not. To retain historic integrity, a property will often possess several, if not all of the aforementioned aspects. Specific aspects of integrity may also be more important, depending on the criteria for which it is significant.

It is important to note that historic integrity is not synonymous with condition. A building or structure can possess all or many of the seven aspects of integrity, even if the condition of the materials has degraded. Condition comes into consideration when there is a substantial loss of historic material or other character-defining features.

California Register of Historical Resources

The California Register of Historical Resources (California Register) is "an authoritative guide in California to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change."[2] A property may be eligible for listing in the California Register if it meets one or more of the following criteria:

- Criterion 1: Associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- Criterion 2: Associated with the lives of persons important in our past;
- Criterion 3: Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- Criterion 4: Has yielded, or may be likely to yield, information important in prehistory or history.

These criteria are based upon National Register of Historic Places criteria; however, the California Register does not impose as specific requirements for integrity and age as the National Register. Properties eligible for listing in the California Register must retain enough of their historic character or appearance to be recognizable as historic resources and to convey the reasons for their significance. While the National Register guidelines for integrity can be applied for California Register eligibility, it is possible that resources which may not retain sufficient integrity for listing in the National Register may still be eligible for the California Register. Moved or reconstructed buildings, structures, or objects may also be considered for listing in the California Register under specific circumstances. In addition, properties that were constructed less than fifty years ago or which achieved significance less than fifty years ago may be eligible for inclusion in the California Register provided that sufficient time has passed to understand their significance within a historic context.

[2] *Public Resources Code Section 5024.1(a)*

Properties may be listed in the California Register through a number of methods. State Historical Landmarks and National Register-listed properties are automatically listed in the California Register. Additionally, properties formally determined eligible for listing in the National Register are automatically listed in the California Register. Properties may also be nominated to the California Register by local governments, private organizations, or citizens.

The California Register of Historical Resources follows nearly identical guidelines to those used by the National Register, but identifies the Criteria for Evaluation numerically (1 through 4). With the exception of some properties with additional criteria consideration (50 years or less, moved buildings, etc.), properties that meet the National Register criteria typically also meet the California Register criteria and vice versa and are often evaluated together.

Evaluating Historic Districts

For a property to be found eligible for the National Register and California Register, it must be classified as either: a building, structure, object, site or district. As specified by the National Park Service, "… the National Register is oriented to recognizing physically concrete properties that are relatively fixed in location." Historic districts are defined by the National Park Service in *National Register Bulletin Number 15:*

> A district derives its importance from being a unified entity, even though it is often composed of a wide variety of resources. The identity of a district results from the interrelationship of its resources, which can convey a visual sense of the overall historic environment or be an arrangement of historically or functionally related properties. For example, a district can reflect one principal activity, such as a mill or a range, or it can encompass several interrelated activities, such as an area that includes industrial, residential, or commercial buildings, sites, structures, or objects.[3]

District Boundaries

National Register Bulletin Number 15 also provides guidance in delineating the boundaries of districts. The boundaries of a district typically encompass the area of land containing the significant concentration of buildings, sites, structures, or objects that convey a shared significant context. A district's significance and historic integrity should help determine the boundaries with consideration of visual barriers, visual changes, boundaries of a specific time, and clearly differentiated patterns of historic development. A historic district may contain discontiguous elements in the following limited circumstances:

- When visual continuity is not a factor of historic significance, when resources are geographically separate, and when the intervening space lacks significance.
- When manmade resources are interconnected by natural features that are excluded from the National Register listing.

[3] *National Register Bulletin Number 15,* 5.

- When a portion of a district has been separated by intervening development or highway construction and when the separated portion has sufficient significance and integrity to meet the National Register criteria.[4]

Contributors and Non-Contributors

In addition, historic districts may have contributing and non-contributing buildings, sites, structures or objects.[5] A contributor adds to the historic associations, historic architectural qualities, or archeological values for which a property is significant because:

- It was present during the period of significance, relates to the documented significance of the property, and possesses historic integrity or is capable of yielding important information about the period; or
- It independently meets the National Register criteria.

A non-contributor does not add to the historic associations, historic architectural qualities, or archeological values for which a property is significant because:

- It was not present during the period of significance or does not relate to the documented significance of the property;
- Due to alterations, disturbances, additions, or other changes, it no longer possesses historic integrity or is capable of yielding important information about the period; or
- It does not independently meet the National Register criteria.

District Integrity

For a district to retain integrity, the majority of the components that make up the district's historic character must possess integrity even if they are individually undistinguished. The relationships among the district's components also must be substantially unchanged since the period of significance. Intrusions within a district may impact its integrity based on the relative number, size, scale, design, and location of the components. A district is not eligible if it contains so many alterations or new intrusions that it no longer conveys the sense of a historic environment.[6]

Review of Previous Historic Evaluation

Ostashay & Associates prepared a Historic Resources Technical Report (HRTR) in May 2014 as part of the environmental review of Coast Community College District's (CCCD) Vision 2020 Facilities Master Plan for OCC as required under the California Environmental Quality Act (CEQA). The HRTR identified a historic district at the OCC campus eligible for the California Register under:

- Criterion 1
  - for its early master planning concepts of a community college located within Orange County

[4] National Park Service, *National Register Bulletin: Defining Boundaries for National Register Properties*, (Washington D.C.: National Park Service), 12.
[5] National Park Service, *National Register Bulletin 16A: How to Complete the National Register Registration Form*, (Washington D.C.: National Park Service), 16.
[6] *National Register Bulletin Number 15,* 16.

- Criterion 3
  - for its distinctive architectural and design qualities as interpreted in an educational facility, and
  - for its direct association with master planner and architect Robert E. Alexander; master architect Richard Neutra; landscape architect Garrett Eckbo; and Orange County architect William E. Blurock.

The HRTR-identified historic district includes 23 contributing buildings (several joined in complexes), the armillary sphere art piece, and landscape features such as the main quad area, walkways, maritime flagpole, planters, mature trees, shrubs and plantings. It has a period of significance of 1948 to 1964 starting with the school's founding and encompassing the initial master planning and design by Robert E. Alexander with collaborators including landscape architect Garrett Eckbo as well as the design and planning work of Alexander's partnership with Richard Neutra through 1957. The period of significance extends to capture buildings designed by Pleger, Blurock, Hougan and Ellerbroek in subsequent campus development through 1964.

The HRTR also finds the Robert B. Moore Theatre Building (Bldg. 2) is individually eligible for the California Register for its unique and distinctive architectural styling and direct association with master designers: architect Richard Neutra; landscape architect Garrett Eckbo; and acoustical engineer Dr. Vern Knudsen. Page & Turnbull concurs with the HRTR's finding that the Moore Theater is individually eligible for the California Register, and it is not further evaluated below.

Page & Turnbull also agrees an eligible historic district is present at the OCC campus. However, based upon the information provided within the HRTR and supplemental research, we have a difference of professional opinion regarding the historic district's boundaries, period of significance, and the number of contributors within the district. Based on our additional research and evaluation (detailed below), Page & Turnbull identified a National Register and California Register-eligible historic district significant under Criterion A/1 (Events) in the context of education for its direct association with the postwar expansion of access to higher education in Orange County. It also meets Criterion C/3 (Design/Construction) as an excellent example of Mid-Century Modern campus planning and design as applied to a junior college, involving the work of master architects Neutra and Alexander in collaboration with landscape architect Garrett Eckbo.

At this time, Page & Turnbull is not providing an opinion on the eligibility of buildings constructed between 1958 and 1964 in the subsequent phase of development. Rather, it is our opinion that the existing determination of eligibility for these additional buildings is not sufficiently supported in the HRTR.

Orange Coast College Historic District Identified by Page & Turnbull

Page & Turnbull identified an Orange Coast College Historic District (Historic District) that "possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development."[7] The Historic

[7] *National Register Bulletin Number 15,* 5.

District's period of significance starts in 1950 with the construction of OCC's first permanent building and ends in 1957 when the final Neutra and Alexander-designed building was completed. The end date also corresponds to the end of the seven-year limited local tax that funded the initial campus development.

Considering this shortened period of significance, the revised Historic District boundaries encompass only the Neutra and Alexander buildings and landscapes from this period. Page & Turnbull developed the Historic District boundaries based on the significant concentration of related buildings, sites, structures and objects in the central core that are associated with the initial development of the campus. The Student Center (Bldg. 86) was constructed during the period of significance and designed by Neutra and Alexander but it has been substantially altered and has lost integrity (see 'Subsequent Development' section in part 1B 'Chronology of Development and Use' of this report). Because the Student Center is no longer a contributing resource and was at the periphery of the Historic District, it was excluded from the Historic District boundaries under this analysis.

Page & Turnbull proposes the inclusion of two discontiguous athletic facilities dating to the seven-year period and designed by Neutra and Alexander: the Swimming Pool complex (Bldg. 93) and Stadium and Field House (Bldgs. 105 and 110). These resources have integrity and do not depend on visual continuity with the central campus to convey their significance.

Table 1 compares the contributors and non-contributors in the HRTR-identified historic district with the Historic District identified by Page & Turnbull.

Table 1D-1: The HRTR table of contributors. Buildings and features within the revised OCC Historic District are highlighted in grey. Italics indicate information that is different from the HRTR.

Significance Evaluation

The following section examines the eligibility of the Orange Coast College (OCC) Historic District identified by Page & Turnbull for listing in the National and California Registers.

Criterion A/1 (Event)

The OCC Historic District is significant under Criterion A/1 (Events) in the context of education in California for its direct association with the postwar expansion of access to higher education through the local development of junior colleges. OCC was among a handful of junior colleges established statewide in the post-World War II years specifically as junior colleges to provide civic, vocational, and continuing education for local high school graduates and other residents. Seen as integral to growing communities' ability to educate its youth and provide trained workers for local businesses, a growing group of high school graduates as well as returning soldiers with access to the GI Bill had access to higher education through local junior colleges. OCC was the only junior college established in Orange County in the immediate postwar years to meet these goals and needs before the 1960 adoption of the California Higher Education Master Plan, which spurred the remarkable expansion of the junior (or community) college system in the 1960s and 1970s.

In Orange County, the addition of Orange Coast College (then Orange Coast Junior College) to the earlier Fullerton College and Santa Ana College provided a modern, public higher education option particularly for the growing postwar Orange County communities further to the south in Huntington Beach, Newport Harbor, and Laguna Beach. The establishment of OCC in 1947 by local community and business leaders and supported by votes of the general electorate, reflected the community's desire to have a higher education option locally and a willingness to fund the junior college with local taxes. This is further supported by the passage of the ballot measure in 1949 to fund the construction of new buildings for Orange Coast College especially when no state funds were available. Course offerings at OCC were tailored to the local industries in Orange County, particularly the petroleum and agriculture fields, and helped to train and educate the local residents and workforce in support of the booming postwar growth of these communities. As with other junior colleges, OCC also provided programs and facilities for the physical welfare and social and cultural enrichment of their students with swimming pools, stadiums, tracks, and an auditorium for theatrical performances.

OCC remained the only postwar community college in Orange County until the mid-1960s when the California Higher Education Master Plan codified the state's tripartite higher education system of community colleges, California State Universities (Cal State), and University of California (UC) campuses. The Master Plan recognized the important role of community colleges in providing broad access to higher education, in addition to taking enrollment pressures off the limited UC and Cal State universities; this resulted in the allocation of state funds for the construction of community colleges for the first time.

Criterion B/2 (Person)

The OCC Historic District does not appear to be significant under Criterion B/2 (Person). Although the inaugural District Superintendent and Orange Coast College President Basil H. Peterson is strongly associated with the initial development of the school, cursory research has not identified him as a significant individual in the broader context of higher education or the community of Costa Mesa. Significance for the property's association with the architect or landscape architect is provided in the analysis under Criterion C (Design/Construction).

Criterion C/3 (Design/Construction)

The OCC Historic District is significant under Criterion C (Design/Construction) as a resource that embodies the distinctive characteristics of a type and period and represents the work of masters Richard Neutra and Robert E. Alexander in collaboration with Garret Eckbo.

Embodies the Distinctive Characteristics of a Type and Period

The OCC Historic District is an excellent example of Mid-Century Modernism in its planning, architecture, and landscape architecture as applied to a higher education campus. Unlike existing four-year colleges and universities that had buildings dating from before World War II, the postwar junior college was a new interpretation of the higher education campus. Although a few colleges had constructed purpose-built junior college campuses during the Great Depression, OCC was among the earliest examples in California of a full campus designed and constructed specifically as a junior college in the Mid-Century Modern style. The campus was planned to meet the programmatic needs of a junior college, with zones for academics, technical training, athletics, and campus life (student union, library, etc.). It was also forward thinking in anticipating some features, such as the theater that could also be used by the greater community in which the campus was located.

The campus design embodies the attention to local climate conditions that characterizes the Mid-Century Modern style in Southern California. Instead of symmetrical settings with axial walkways and traditional quads, OCC's site design placed practicality and site conditions over formal and traditional campus planning. Instead of enclosed buildings, multiple buildings with related uses form complexes connected by covered walkways as outdoor hallways. The siting of the classroom complexes at 45-degree angles protected them from predominate westerly and southwesterly winds while allowing for natural lighting and cross ventilation through windows on two sides. In the days before florescent lighting was the norm and when heat from incandescent bulbs had to be controlled, classrooms depended on natural lighting. The classroom buildings' expansive window walls faced northeast with wide overhangs to provide bright but indirect light during instructional hours. Louvered clerestory windows to the southwest limited direct sun and mitigated glare.

The classroom building orientation created a diagonal pattern with major axial walkways, secondary paths and open spaces. Patios and courtyard spaces allowed for causal gathering while the spaces between and enclosed by buildings acted as outdoor rooms. The small-scale landscaped features of wing walls and screen walls further tie the buildings with the landscape and with the site's environmental conditions.

The non-academic facilities, such as the Speech Arts Building (now Theater and Music complex, Bldgs. 2 & 4), Swimming Pool complex (Bldg. 93), and the Stadium and Field House (Bldgs. 105 and 110), were also rendered in the modern idiom and with modern materials like concrete and particle board (Flexboard).

As a particularly early example of a postwar junior college campus specifically designed and constructed for this nascent typology, Orange Coast College received widespread attention through the national and international architectural journals. The February 1952 issue of *Progressive Architecture* highlighted junior college buildings and used OCC as one of two case studies. The article's introduction detailed Alexander's approach to calculating space requirements, noting his "completely rational space analysis" is interesting and should be considered along with other standard techniques.[8] OCC was also offered as a case study in school planning publications for campus planning and the design of building types specific to junior colleges, such as its original Technology Building (1950, demolished ca.1997) and Science Building (now Math Wings, Reprographics, and Planetarium, Bldgs. 35-39). Alexander and OCC's then Assistant Superintendent William F. Kimes participated in a summer institute at Stanford University's School Planning Laboratory in 1958 focused on the planning of new junior colleges in recognition of their growing role in California's higher education system. "Persons who had successfully met and solved some of the many problems of junior college planning were invited to share their knowledge and experience with other educational leaders."[9] Alexander and Kimes authored papers on facilities for technology and science in the publication *New Dimensions in Junior College Planning* that resulted from the summer institute.

The OCC Historic District is an intact example of the postwar junior college campus that embodies the Mid-Century Modern design in California. Of the other junior college campuses built as a cohesive whole in the postwar years of the 1950s to early 1960s, few appear to retain a cohesive district. Only Foothill College in Los Altos Hill in Northern California appears comparable to Orange Coast College.

Represents the Work of Masters

The OCC Historic District exemplifies the design and planning approach of Richard Neutra and Robert E. Alexander during their decade-long partnership from 1949 to 1958. The campus

[8] "College Buildings: Space Analysis," *Progressive Architecture,* February 1952, 61.
[9] James D. MacConnell, "Foreword," in *New Dimensions in Junior College Planning*, (Palo Alto, CA: Stanford University School Planning Laboratory, 1958).

conveys the skills of both designers. It combines Neutra's focus on the human experience and connection to the outdoors with Alexander's large-scale site planning to result in a unique collection of buildings that span their partnership.

The buildings reflect Neutra's biorealism philosophy in their indoor-outdoor relationship, human scale, and attention to the occupant's experience. They have an elegant play of spatial relationship in massing and planes, solids and voids, and openness and compression. The subtle details that use proportion, shapes, angles, and light to transform simple materials and give them texture are emblematic of Neutra's skills. Mindful of a limited budget set by the seven-year tax, Neutra and Alexander used simple, modern materials in creative and dynamic ways, including the angled north[10] window walls at the classroom complexes and overlapping and extending planes of walkway roofs at the breezeway to building ends that are well-proportioned and well-balanced. OCC allowed Neutra an opportunity to expand on his early innovative elementary school designs into a higher education setting and to design specific building types, such as a planetarium, a theater, and a stadium.

According to Alexander's oral history, OCC was a significant client for him when he first started his own architecture firm after the success of Baldwin Hills Village.[11] Alexander took the lead on master planning the campus, requiring careful study of functional needs of the faculty, the rational calculation of needed space, and progressive approaches to educational facilities. These issues are reflected in the overall plan for OCC. Following his work on the master plan, Alexander brought OCC as a client into the Neutra and Alexander partnership.

Landscape architect Garrett Eckbo, who had recently relocated to Southern California and shared office space with Alexander, was part of the original team for the master plan. In his book *Landscape for Living*, Eckbo credited Alexander with the "primary planning role," and himself as "the landscape architect [who] functioned as consultant to him—a very productive collaboration."[12] Eckbo described OCC as:

> A complete and integrated college plant, satisfying both functionally and esthetically. Site flat and fanned by persistent southwest breezes which are cooling to the point of establishing a need for windbreaks. General pattern of buildings and trees will do this. Central quad pattern of paving, grass, water and trees is small enough for intimacy and warmth, large enough for spatial imagination.[13]

OCC was among the earliest completed projects Neutra and Alexander worked on together. After completing his master plan, Alexander received the initial building and site improvement commissions just as he and Neutra started collaborating. The first three permanent buildings, the Technology Building, the Library (Bldg. 7 and part of Bldg. 8), and the Fine Arts Center were

---

[10] As per the original plans for the diagonally oriented buildings, this report considers the northeast-facing façade as plan north or north.
[11] Robert E. Alexander, interview by Marlene L. Laskey, 3 October 1986, UCLA Oral History Program, Tape number: VII, Side One (October 3, 1986), http://oralhistory.library.ucla.edu/Browse.do?descCvPk=27599.
[12] Garrett Eckbo, *Landscape for Living* (1950; repr., Santa Monica, CA: Hennessey + Ingalls, 2002), 201.
[13] Eckbo, *Landscape for Living*, 201.

designed by Alexander following his master plan; only the Library Building remains today as the Student Success Center (Bldg. 7) and part of Classroom and Lab (Bldg. 8). The Orange Coast Junior College District's Board of Trustees considered seeking other architects for new building projects in 1952, but with Neutra newly teamed with Alexander, the two continued to receive the OCC commissions through the seven-year building plan.[14] The identified Historic District conveys the Neutra and Alexander partnership with collaboration from Eckbo in the individual buildings as well as the overall spatial relationships between built features.

In addition to being part of the initial master plan team with Alexander, Eckbo also was the landscape architect for almost all of the buildings constructed during the initial seven-year plan. As the landscaping was not fully realized according to Eckbo's plans and has had some alterations, it does not appear to meet Criterion C/3 as it currently exists as a representative work of Eckbo. Nonetheless, his exclusive collaboration with Neutra and Alexander for OCC over the initial seven-year period and the elements of the landscape plan that remain, including circulation paths, outdoor spaces, and integration of buildings and site, are noteworthy.

Among Neutra and Alexander's work, the buildings and plan at OCC received substantial media coverage nationally and internationally over the building period and well after. The individual buildings were published in *Progressive Architecture*¸ *College & University Business, American School and University*, and international journals in Germany and Japan. They also received several awards from the AIA Southern California Chapter and Business Education (Bldgs. 12-14) received a National AIA Merit Award in 1954.

Although Neutra and Alexander collaborated on the design of several elementary and high school campuses, OCC is one of the few higher education projects where they designed multiple buildings. It remains a rare collection of higher education buildings by Neutra and Alexander with the collaboration of master landscape architect Garrett Eckbo.

Integrity Evaluation

As stated above, in addition to qualifying for listing under at least one of the National Register or California Register criteria, a property must be shown to have sufficient historic integrity in order to be considered eligible for listing in the National Register and California Register. The process of determining integrity is similar for both the California Register and the National Register. The same seven variables or aspects that define integrity—location, design, setting, materials, workmanship, feeling and association—are used to evaluate a resource's eligibility for listing in the California Register and the National Register.

The guidelines for integrity in the *National Register Bulletin: How to Apply the National Register Criteria for Evaluation*, allow for a broad interpretation of the aspects of integrity so that these

[14] According to the Board's meeting minutes, Alexander spoke to the Board about his recent partnership with Neutra, "a world-renowned architect" with considerable experience in school design. He also pointed to the recent 15-page profile about OCC's new buildings in *Progressive Architecture*. Alexander's recalled in his oral history that Neutra was part of the interview for the Speech Arts Building (Theater) commission and that changed the Board's mind. See Board of Trustees meeting minutes, Orange Coast Junior College District, March 10, 1952 and Alexander oral history, Tape number: IX, Side Two, October 4, 1986.

aspects can be applied to any property type. For the OCC Historic District, the integrity discussion will evaluate the district as a whole as well as the contributing buildings and landscape.

Location

The OCC Historic District is in its original location, as are all the contributing buildings. Therefore, the Historic District retains integrity of location as whole.

Design

The design of the campus as it was at the end of the period of significance in 1957 generally remains. Two buildings present during the period of significance have been demolished (the Technology Building and the Fine Arts Center) and one building is substantially altered (Student Center, Bldg. 86). However the Historic District remains recognizable and able to convey its significance through the grouping of classroom complexes and their relationship to the Theater (Bldg. 2) as well as the athletic facilities. The new buildings constructed in the locations of the Technology Building and Art Center Building are outside the boundaries of the OCC Historic District and sufficiently separated as to not overwhelm the contributing buildings.

Building 10 and the large addition to Building 14 are the only significant additions into the core of the Historic District from after the period of significance. Though they mar the open space between buildings and disrupt the original circulation paths, these two non-contributors are relatively in scale with the classroom complexes, and the campus' original spatial relationships are still perceivable around the buildings.

The design of the contributing buildings remains in place and visible, despite the addition of HVAC equipment on several covered walkway roofs that conceal clerestory windows and are unsightly. Building 7 has altered roof forms and additions on the south (rear) side slightly change its massing, but the alterations are not considered to be substantial enough to compromise this building's integrity and its contributor status within the Historic District. Similarly, the additions to the Theater (Bldg. 2) and Music Building (Bldg. 4) are at secondary façades and the buildings relate to the Historic District as they were originally designed.

Setting

The setting within the OCC Historic District has had some intrusions, such as the addition to the Business Education Building (Bldg. 14) and construction of Building 10 that altered the spatial relationship and open space between some buildings. These two buildings also disrupted the primary east-west pedestrian axis that extended from the Student Center (Bldg. 86) through the classroom complexes. However, the distinct diamond grid with secondary cross paths in the center core remains visible and most of the circulation pattern continues to function as originally designed. In addition, because linear classroom buildings are staggered, the buildings' relationship to each other can still be experienced from other approaches despite Building 10 and the Building 14 addition.

Other alterations to the landscape and setting have also occurred, such as the removal or addition of a few secondary (X-pattern) pathways and the replacement of the irregular pavers at these pathways with more standard concrete paving. However, the character of the Historic District—the indoor/outdoor relationships, low-scale buildings set among open space, the open spaces bounded by built features—remain sufficiently to have integrity of setting.

The setting of the OCC campus has changed as subsequent phases of development expanded the institution. Most of the newer construction is at the periphery of the campus, allowing the center core with the classroom complexes to maintain its integrity of setting. The 1960s buildings north of the classroom complexes are similar in scale and massing so as not to disrupt the Historic District's historic educational and institutional setting.

Materials

Many interior finishes have been removed or altered from the contributing buildings; however, they retain the majority of their exterior materials. They have original building cladding, windows, doors, and covered walkways. As the preservation of exterior materials is more relevant to the integrity of historic districts, the OCC Historic District retains integrity of materials as a whole.

Workmanship

Although some material replacements have occurred, the contributing buildings generally retain the original workmanship especially in the subtle design details and their execution that mark these as modern buildings. For example, the corbeled brick units on the angled walls of classroom buildings as well as the poured-in-place concrete at the Theater (Bldg. 2) and Planetarium (Bldg. 39) retain their original workmanship. Additionally, the use of early postwar mass-produced materials and construction methods continue to be reflected in the buildings' physical fabric.

Feeling

The OCC Historic District retains its integrity of feeling. It continues to function for academic and campus life uses on a community college campus. It retains its Mid-Century Modern buildings and landscape that reflect the period of its original construction.

Association

The OCC Historic District remains a community college campus and continues its association with the history and development of the junior or community college. Unlike most community colleges from the same era that have lost significant portions of their original classroom buildings and landscapes or have had intrusions from later periods of development within the original campus cores, the OCC Historic District retains significant components associated with the postwar junior college campus.

The OCC Historic District is eligible for the National and California Registers. The Historic District is significant under Criterion A/1 in the context of education in California for its direct association with the postwar expansion of higher education through the local development of junior colleges. It also meets Criterion C/3 as an excellent example of a Mid-Century Modern junior college campus and is also significant as a work by master architects Neutra and Alexander in collaboration with landscape architect Garrett Eckbo. The Historic District has a period of significance of 1950 to 1957 and retains all aspects of the integrity.

Character-Defining Features & Significant Spaces

Character-defining and significant spaces of a historic property are those tangible elements that embody its significance or its association with specific events. They are the physical parts of both the exterior and interior that should be retained and preserved.

- **Character-defining features** are those elements or architectural components that establish the visual character of the property.
- **Significant spaces** are rooms or spaces that are important to a property because of their size, height, proportion, configuration, or function. Multiple spaces might be visually or physically related and/or arranged in a sequence that is important in defining the character of the property.

The character-defining features and significant spaces of the identified Orange Coast College Historic District include the following:

Overall Historic District:

- Central campus academic core with separate athletic facilities
- Low-scale, Mid-Century Modern design
- Buildings organized in complexes
- Original classroom complexes placed at 45-degree angles and offset to the northeast
- Specialized complexes sited north-south and placed near parking lots
- Within the central core of the Historic District;
  - Pedestrian-oriented space with paved walking paths in straight and diagonal patterns
  - Open spaces connecting complexes
  - Courtyard and patio spaces around and between buildings and their built-in features, such as planters and trellises
- Clock tower (attached to Building 7)
- Armillary sphere sculpture (near Building 35 and associated with Buildings 35-39)

Figure 1D-1: Aerial image of Orange Coast College campus with the identified Historic District bounded by orange. Image from Google Maps, 2015, edited by Page & Turnbull.

Classroom Complexes – Shared Features

Within the central campus are three classroom complexes that share similar features. These complexes, set at 45-degree angles, are:

- Buildings 7, 8, 9 | Student Success Center and Classrooms & Labs complex
- Buildings 12, 13, 14 | Business Education complex
- Buildings 35, 36, 37, 38, 39 | Math & Planetarium complex

Their shared character-defining features include:

1. One-story massing
2. Two linear, rectangular classroom buildings separated by breezeway/patio
    a. Low pitched roofs
    b. Aluminum window walls canted outwards on low brick walls at north façades
    c. Solid walls with door openings and clerestory windows at south façades
    d. Solid east and west walls
3. Mixed-use buildings south of the linear structures connected by covered walkways
4. Covered walkway between the linear classrooms and mixed-used buildings
5. Landscaped features include:
    a. Brick screen and wing walls
    b. Paved patio/courtyard spaces adjacent to buildings
    c. Brick and concrete planters, trellis, etc.

In addition to the shared characteristics, each classroom complex has specific character-defining features as detailed below.

Figure 1D-2: Historic image of the Science Complex (Bldg. 35-39) with character defining features identified by red callouts. Original photo by Julius Shulman, edited by Page & Turnbull.

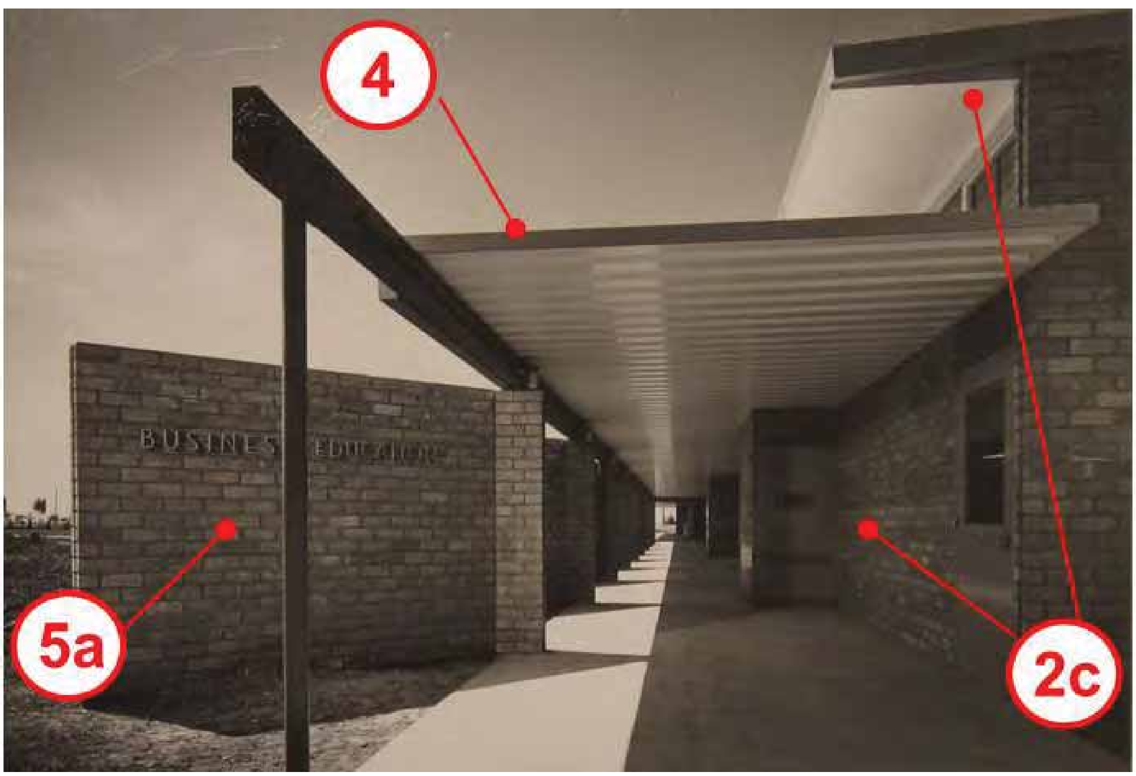

Figure 1D-3: Historic image of Business Education (Bldg. 12 in photograph) with character defining features identified by red callouts. Original photo by Julius Shulman, ca.1954, edited by Page & Turnbull.

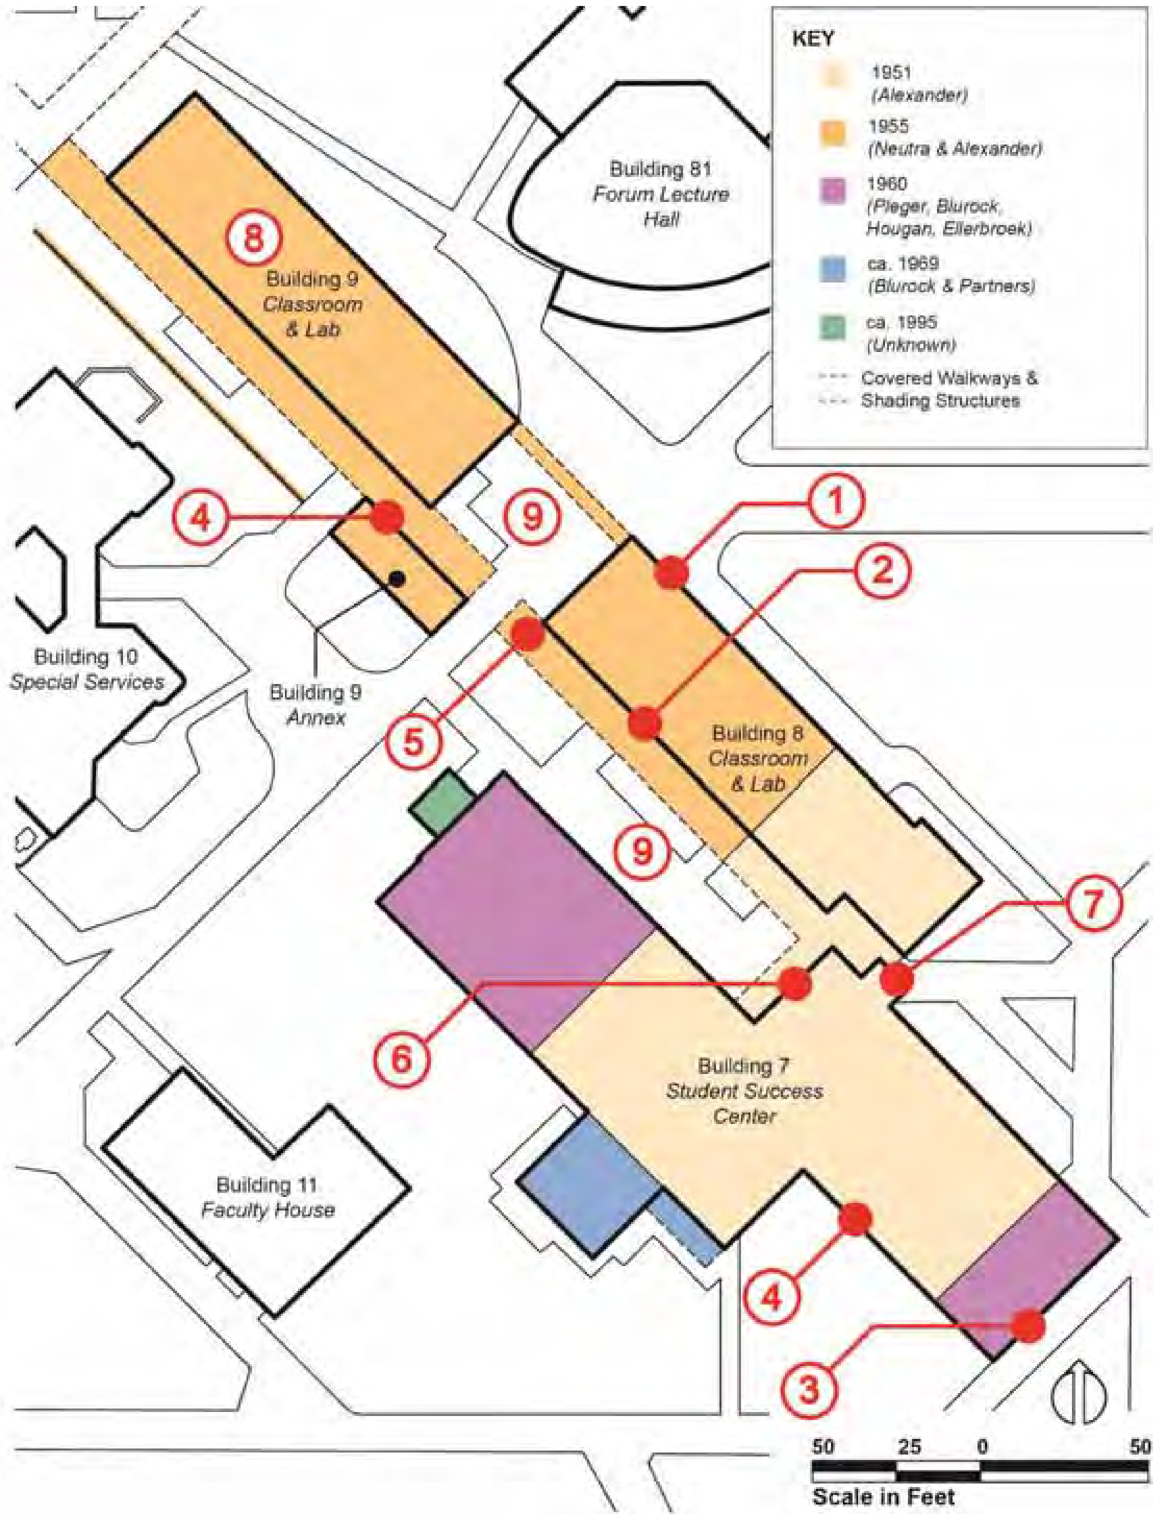

Figure 1D-4: Map illustrating the chronological development of the Student Success Center and Classroom & Labs complex (Bldgs. 7-9) and the location of character defining features. Image by Page & Turnbull.

Buildings 7, 8, 9 | Student Success Center and Classrooms & Labs complex

Complex-specific character-defining features:

1. Window walls on low brick walls
2. Wood doors and clerestory windows
3. Concrete walls
4. Brick and plywood/wood veneer cladding
5. Covered walkways
6. Glazed wall
7. Clock tower
    a. Open structure
    b. Both clock faces and hands
8. Typical classrooms with
    a. Visible sloped roof
    b. North window wall
    c. South clerestories
9. Landscape patio and courtyard
    a. Planters
    b. Trellis
    c. Tapered supports
    d. Stucco box eave

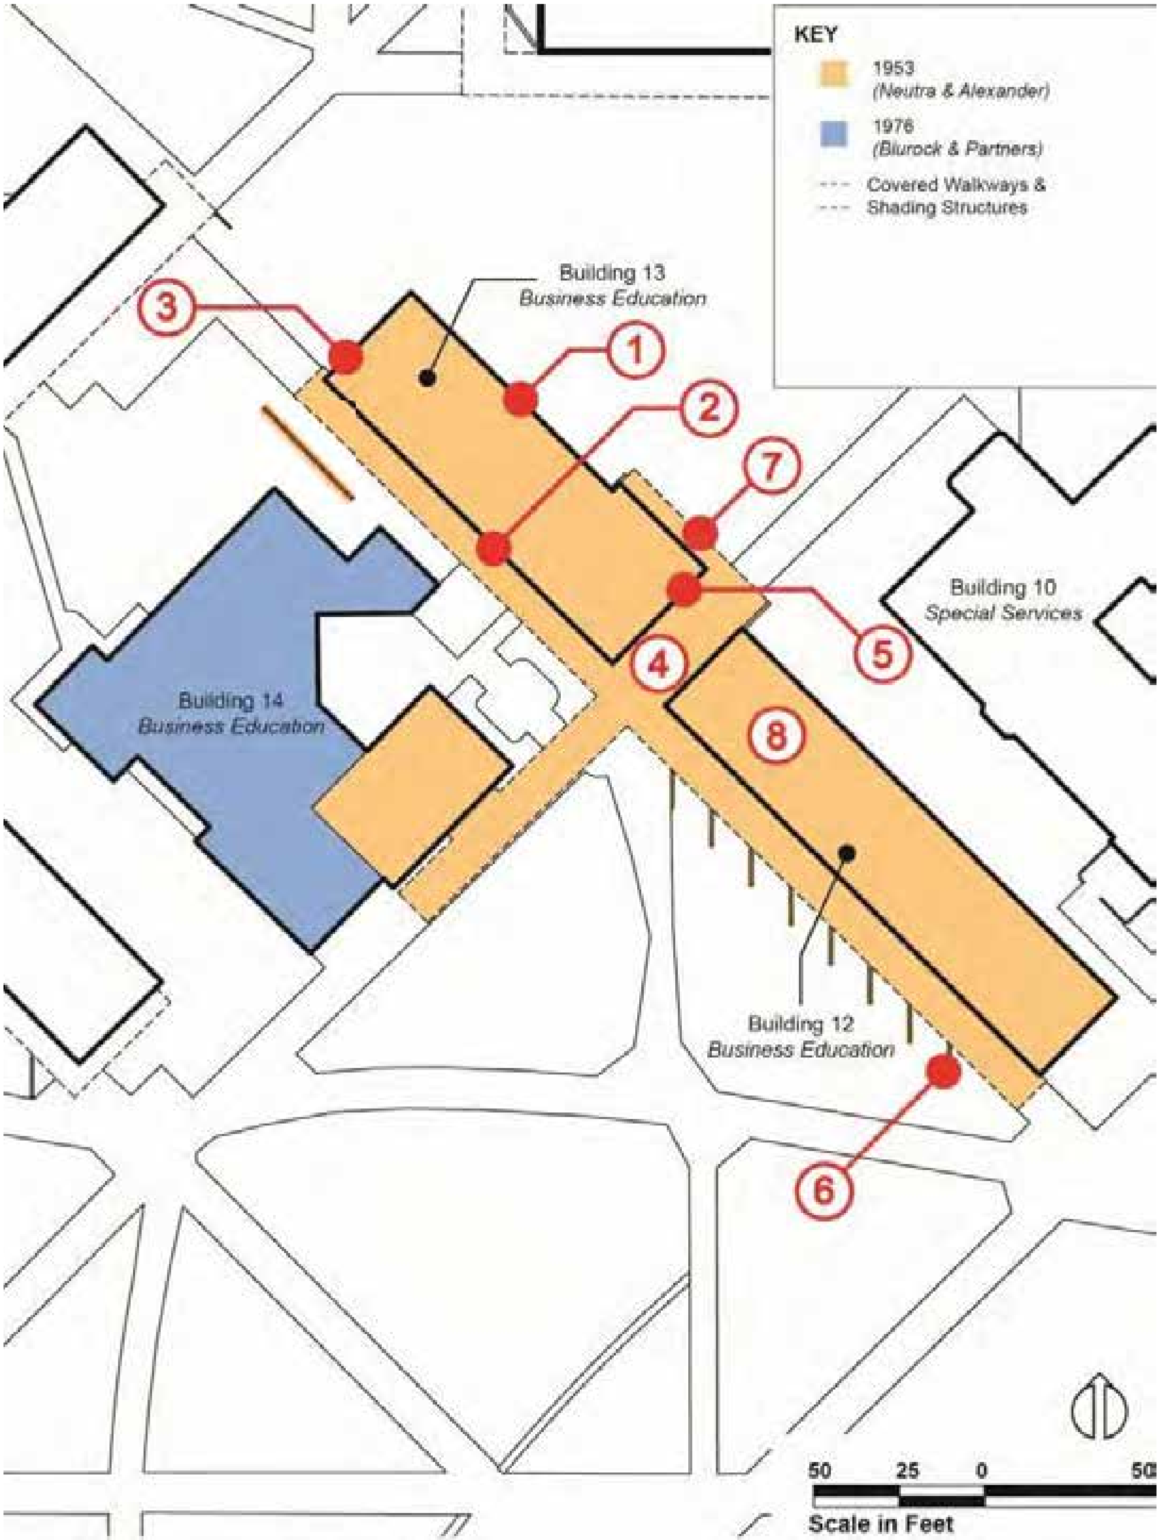

Figure 1D-10: Map illustrating the chronological development of the Business Education complex (Bldgs. 12-14) and the location of character defining features. Image by Page & Turnbull.

Buildings 12, 13 | Business Education complex

Complex-specific character-defining features:

1. Window walls on low brick walls
2. Wood doors and clerestory windows
3. Brick cladding
4. Covered walkways with overlapping planes at breezeway
5. Glazed wall
6. Brick wing walls and screen wall
7. Trellis
8. Typical classroom with
    a. Visible pitched roof and steel ridge beam
    b. North window wall
    c. South clerestories
    d. Brick partition walls
    e. Wood veneer paneling and built-ins, where extant

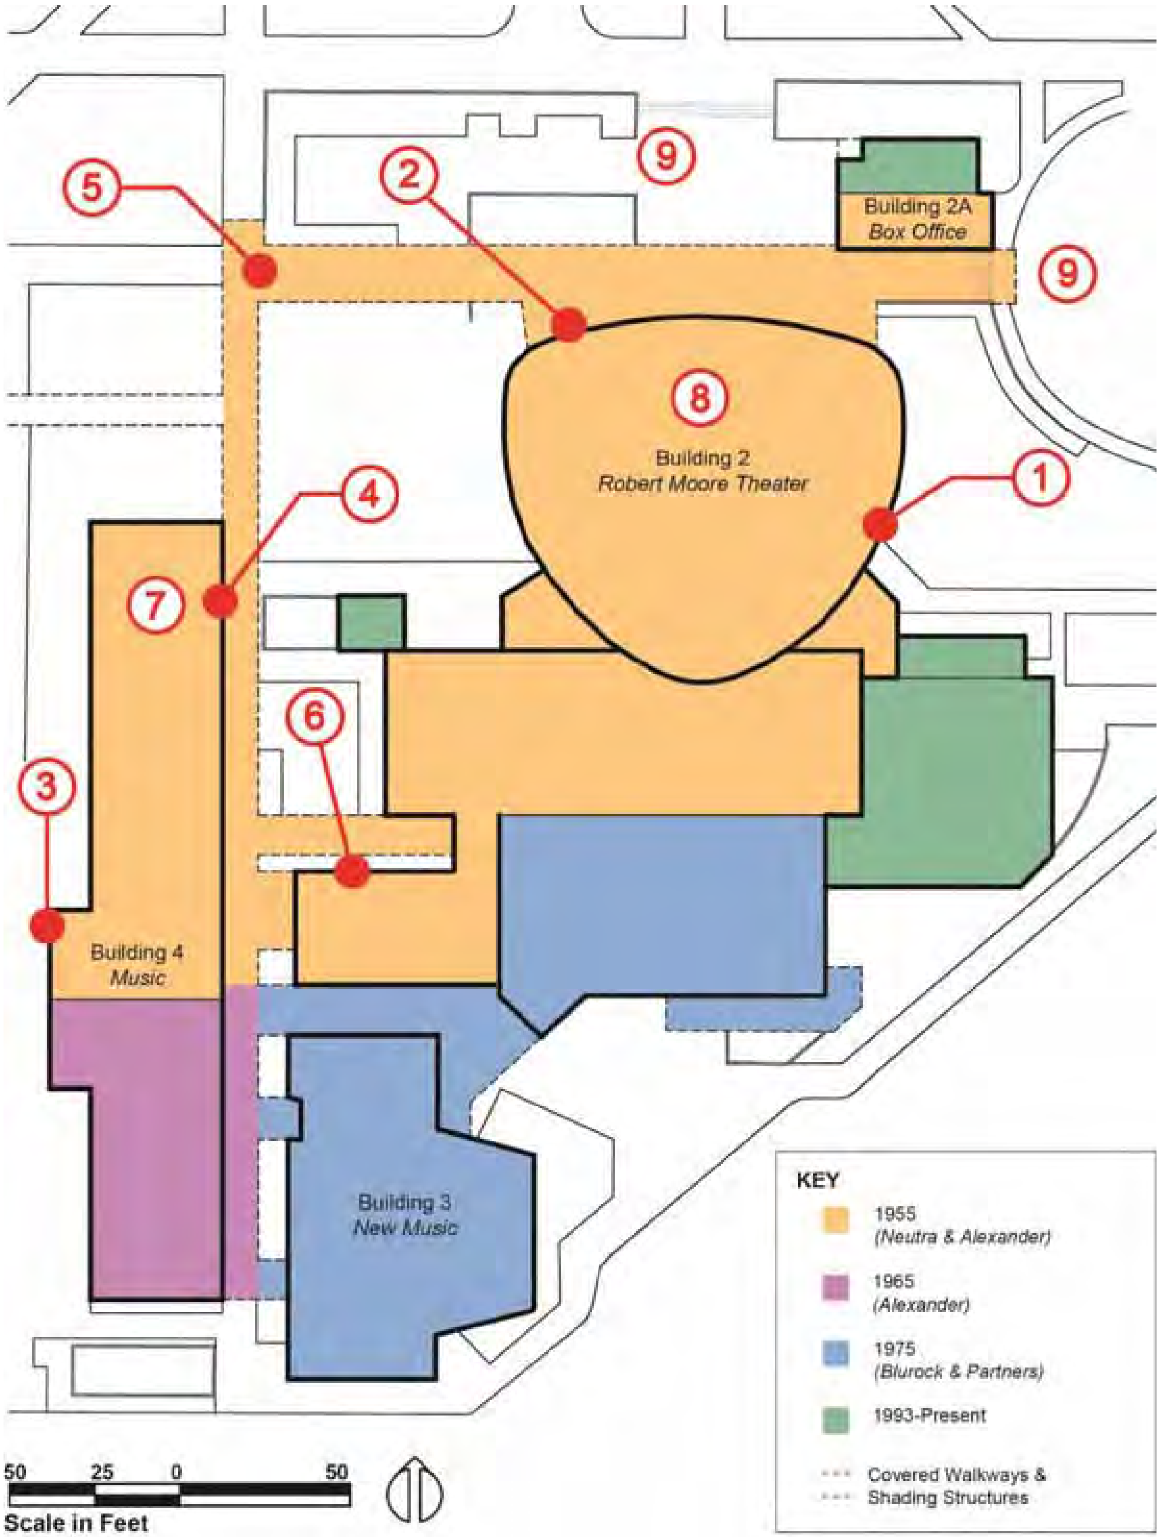

Figure 1D-16: Map illustrating the chronological development of the Theater and Music complex (Bldgs. 2 & 4) and the location of character defining features. Image by Page & Turnbull.

Buildings 2, 4 | Theater and Music complex

Complex-specific character-defining features:

1. Poured-in-place concrete walls
2. Wood cladding and doors
3. Brick cladding
4. Stucco cladding
5. Covered walkways overlapping planes and integrated lighting/gutter
6. Wood and aluminum windows
7. Curved wood wall/ceiling and tiered floor in classroom
8. Auditorium interior
    a. Overall volume
    b. Entry vestibules and interior wood doors
    c. Coved ceiling
    d. Orchestral pit (if extant) & rear stage
9. Landscape features
    a. Entry stairs/sequence
    b. Outdoor lobby/patio
    c. Brick planters
    d. Brick walls

Buildings 35, 36, 37, 39 | Math & Planetarium complex

Complex-specific character-defining features:

1. Window walls on low brick walls
2. Wood doors and clerestory windows
3. Brick, stucco and plywood/wood veneer cladding
4. Planetarium' s concrete walls and copper-clad dome
5. Covered walkways with overlapping planes at breezeway
6. Brick wing walls
7. Exterior stair at Bldg. 37
8. Armillary sphere sculpture
    a. Metal sculpture
    b. Carved concrete base
9. Typical classroom with
    a. Visible pitched roof and steel beam
    b. North window wall
    c. South clerestories
    d. Spatial layout of prep rooms shared between classrooms
    e. Wood veneer paneling and built-ins, where extant
    f. Interior wood doors, where extant

Building 93 | Swimming Pool complex

Complex-specific character-defining features:

1. Two pools
   a. Overall size, shape, and relationship
   b. Concrete/gunite bowls
2. Concrete bleachers
   a. Concrete tiers
   b. Wood side fence
   c. Structure and columns
3. CMU wall with integrated bench

Buildings 105 & 110 | Stadium and Field House

Complex-specific character-defining features:

1. Berms
2. Below grade field
3. Curved concrete bleachers
    a. Concrete aisles and stairs
    b. Metal pipe hand rails
4. Field access ramp
5. Poured-in place concrete walls and stairs
6. Original press box
    a. Rooftop deck
    b. Overhang and trellis
    c. Canted glazing
    d. Solid band below glazing
7. Field House
    a. Overhanging exposed rafter roof
    b. Board and batten and stucco cladding
    c. Aluminum windows

Significance Diagrams

This section provides an analysis of the relative zones of significance present in the Orange Coast College Historic District. Utilizing accepted standards for the evaluation of historic resources, the major historical features have been identified and visually documented within a series of significance diagrams. The zoning seeks to identify the difference between more and less significant interior and exterior building areas and assigns a level to each zone. The zone ratings establish management and treatment requirements for each zone, i.e. highly significant area may be in a restoration zone where maintenance is controlled and replacements are restricted. At the other end of the spectrum, non-historic areas allow for greater latitude to change or demolish. The treatment guidelines for each level convey the general principles of preservation to be applied within the zone.

For the purposes of this analysis, Page & Turnbull surveyed the buildings, including all exterior façades and interior spaces, and evaluated their relative significance by categorizing them as follows:

Level 1 – Primary Significance
Level 2 – Secondary Significance
Level 3 – Contributing
Level 4 – Non-Contributing

The significance levels at the Swimming Pool complex (Bldg. 93) and Stadium and Field House (Bldgs. 105 and 110) are specific to those resources and less related to the Historic District as a whole.

Primary Significance (Red)

Definition: Spaces, elements or materials characterized by a high degree of architectural significance and a high degree of historic integrity.

Description: Features of primary significance in the OCC Historic District are the contributing buildings' overall form and massing, fenestration pattern, exterior materials, and architectural details. Also of primary significance are the spatial relationship of buildings within each complex, the distinctive brick wing walls at Buildings 12 and 35, the prominent clock tower at Building 7, and major circulation paths in the Historic District. The bleachers at the Stadium (Bldg. 105) are also in this level.

- Building exteriors
  - Overall massing
  - Cladding
  - Fenestration pattern and windows
  - Wood doors
  - Overhangs and trellises
- Spatial relationship of buildings within complexes
- Brick wing walls

- Clock tower
- Major circulation paths
- Stadium bleachers

Preliminary Guideline: Primary significant exterior features and materials should be retained and preserved, or where alterations have occurred, be restored. Deteriorated materials should be repaired rather than replaced. Where replacement is necessary due to extensive material deterioration or failure, replacement materials should match the original materials and forms. Restoration projects to remove alterations deemed inappropriate should be undertaken where necessary. Maintenance and preservation of these areas should be the highest priority.

Secondary Significance (Orange)

Definition: Spaces, elements or materials that are ancillary or supportive of the primary significant features that contribute to the understanding of the overall design.

Description: Features of secondary significance to the OCC Historic District include the covered walkways that connect buildings within a complex, brick screen walls, and ancillary buildings in complexes, such as the restroom Building 9a and the ticket office Building 2a. Landscape elements are also of secondary significance, including patios and courtyards, and their associated built-in features (planters, trellis, etc.), the open space between buildings and complexes, and the armillary sphere sculpture. One interior space has secondary significance: Room 101 in the Music Building (Bldg. 4) with its original curved wood wall/ceiling and tiered floor. The Swimming Pool complex (Bldg. 93) and the press box and textured concrete walls at the Stadium (Bldg. 110) are also in this level.

- Covered walkways
- Ancillary buildings
- Brick screen walls
- Patios and courtyards adjacent to buildings
  - Built-in planters and features
- Open space between complexes
- Armillary sphere sculpture
- Room 101, Music Building (Bldg. 4) –Original choral room

Preliminary Guideline: Similar to the primary significant features, secondary significant features should be retained and preserved. Deteriorated materials should be repaired rather than replaced. Where replacement is necessary due to extensive material deterioration or failure, replacement materials should match the original materials and forms. Alteration or removal of these features may be necessary for programmatic or building system requirements; however removal of these features should be minimized or mitigated.

Contributing (Yellow)

Definition: Elements characterized by a lesser degree of architectural significance, yet retain a high degree of historic integrity, or historically important, yet altered elements.

Description: Contributing features of the OCC Historic District include the general interiors of contributing buildings, specifically their character-defining features of overall volume (i.e. ceiling heights), interior expressions of exterior character-defining features (brick and concrete walls, fenestration, roof shape), significant interior spatial relationships (prep. rooms between classrooms at Building 35-37), and wood veneer built-ins where extant. The secondary pedestrian circulation paths and the Field House (Bldg. 110) are also considered Contributing.

- Classroom building interiors
- Theater auditorium and stage house interior
- Secondary circulation paths
- Altered open space between complexes
- Field House (Bldg. 110)

Preliminary Guideline: Contributing elements should be retained wherever possible, but are not essential to the Historic District's ability to convey its overall significance. Where required, alterations and additions should be designed to be compatible with the existing elements and materials. New materials and assemblies at reconstructed areas should be similar to the original.

Non-Contributing (Grey)

Description: Non-Contributing elements are generally non-historic elements or elements that have been altered to the extent that their original character is absent.

Description: Non-Contributing features of the OCC Historic District include the compatible and non-compatible additions to various buildings after the period of significance. They also include original but not significant restroom, mechanical, and janitorial interiors as well as significantly altered interiors, such as in Building 7 (Student Success Center) and back-of-house parts of Building 2 (Theater).

- Additions outside the period of significance. Note: Some additions are compatible and can remain. These include
  - Building 7's 1960 additions
  - Building 36's 1960 addition
  - Building 4's 1964 addition
- Restroom interiors
- Mechanical and janitorial spaces
- Significantly altered or non-significant interiors
  - Building 7
  - Back-of-house areas of Building 2

Preliminary Guideline: Non-Contributing elements are not specifically limited by preservation recommendations, except to note that the overall character of alterations to an historic building must meet the general requirements set forth in the *Secretary of the Interior's Standards for the Treatment of Historic Properties* (Standards). Alterations to these areas may be undertaken as long as changes do not effect adjoining Significant or Contributing areas. While there are no specific recommendations for the treatment of Non-Contributing spaces, the building's general organization should be preserved where possible. Furthermore, Non-Contributing additions could be removed to improve the building's overall integrity.

Overall Historic District

1E. EXISTING CONDITION ASSESSMENT

Introduction

An existing condition assessment of campus buildings and facilities was completed to document and assess the condition of the existing buildings, to identify areas of immediate concern, and to identify and recommend treatments and repair strategy. Buildings included in the assessment are considered eligible for inclusion in the Historic District at Orange Coast College (Figure 2: Campus Map).

The buildings assessed in this study were designed by architects Richard J. Neutra and Robert E. Alexander and constructed between 1951 and 1957. The buildings have been grouped into complexes for discussion as follows:

- Student Success Center and Classrooms & Labs complex (1951/1955) - Buildings 7, 8 and 9
- Business Education complex, original construction only (1953) - Buildings 12, 13 and 14
- Theater and Music complex (1955) - Buildings 2 and 4
- Math Wing and Planetarium complex (1956-7) - Buildings 35, 36, 37, 38 and 39
- Swimming Pool complex (1954) - Building 93
- Stadium and Field House complex (1955) - Buildings 105 and 110

Figure 1[i]: The Student Success Center and Classroom & Labs complex (Bldgs. 7-9), facing plan east.[ii]

[i] Note: All figure references within the body of the text in report Part 1E refer to the figures produced in Part 1E only.

[ii] All photographs in this part of the Historic Structures Report were taken by Page & Turnbull, 2014-2015, unless sourced otherwise. As per the original plans for the diagonally oriented buildings, this report considers the northeast-facing façade as plan north or north, southeast-facing façade as plan east or east, southwest-facing façade as plan south or south, and northwest-facing façade as plan west or west.

Figure 2: Campus map identifying the buildings that were included in the condition assessment (orange).

Methodology

The buildings contributing to the Historic District at Orange Coast College (OCC) were visually surveyed during a week of site visits conducted January 12 through 16, 2015 by the Page & Turnbull Team (the Team). The survey consisted of visual observations of the buildings' exteriors and interiors. Materials testing and/or laboratory analysis was not completed during the assessment. The Team was able to access the majority of the spaces at this time and was assisted on site by the Orange Coast College Maintenance and Operations staff.

Documentation was undertaken in the form of field notes on field inspection checklists prepared for the site. Digital photographs were taken throughout the interior and exterior of the buildings. The assessment was further aided by historic drawings and photographs that were referenced during the survey enabling some construction details to be field verified.

The structural system, mechanical, electrical, and plumbing systems (MEP), fire and life safety, and hazardous materials (HazMat) were surveyed. These evaluations are summarized in this part of the report and are included in full in the Appendices.

The weather was dry at the time of the survey, but heavy rainfall the weekend immediately prior to survey commencement highlighted areas of water dispersal deficiencies.

The results of the condition assessments have been recorded in this report as a series of material systems for the complexes with similarities in design, construction techniques, and materials, followed by condition assessments for each of the individual complexes.

Condition Definitions

Throughout this report conditions of various building elements are described on a good, fair, poor as well as a heavy, medium, light rating system. These terms are defined in Table 1 below.

Table 1: Condition Definitions (used throughout the report).

Rating	Description
Good (G)	The material or feature is intact, structurally sound, or performing its intended purpose in a manner that is not damaging to another feature or material. The material or feature does not need repair or rehabilitation, but should be routinely maintained to prevent deterioration or damage.
Fair (F)	The material or feature exhibits signs of wear, failure, or deterioration, but is still structurally sound and performing its intended purpose. The material or feature may be in need of repair or rehabilitation.
Poor (P)	The material or feature is either missing; no longer functioning or performing its intended purpose; or is deteriorated or damaged to the point that hinders its ability to convey historical significance. Rehabilitation, restoration, or reconstruction is recommended.
Heavy (H)	The material or feature requires significant repair and/or alteration.
Medium (M)	The material or feature requires a moderate level of repair and/or alteration.
Light (L)	The material or feature requires a low level of repair and/or alteration.

Summary of Findings

The survey was undertaken as described in the methodology above. The results of the condition assessment indicate that the buildings that contribute to the Historic District are generally in good to fair condition for their age and there are no major safety or failure issues. The original construction methods and previous seismic upgrades have addressed many structural deficiencies, however some additional structural upgrades are needed; there are sensitive ways to complete this work and maintain the appearance of the building. There have been varying levels of MEP systems upgrades with some buildings needing full rehabilitation while others only need minor improvements. Table 2 below gives a summary rating for the conditions of each individual building and Table 3 summarizes the conditions of the material systems.

Table 2: Summary of Condition Assessments Findings (* = Building does not currently have a sprinkler system. Condition assumes no future sprinkler system although installing a sprinkler system may offer code advantages under the California Historic Building Code (CHBC)).

[iii] Categories are blank because these investigations were not undertaken for this building.

Table 3: Summary of system conditions.

System	Condition
Brick Walls	▫ Overall Condition: Fair to Good ▫ No significant damage ▫ Brick spalls at isolated locations, typically screen walls
Concrete Walls	▫ Overall Condition: Good ▫ No significant damage ▫ A few small hairline cracks and surface texture loss at Theater (Bldg. 2)
Stucco- and Wood-Clad Walls	▫ Overall Condition: Fair to Good ▫ No significant damage ▫ Minor moisture damage includes peeling paint at base of some walls ▫ Some visible repairs and patches due to mismatched color / texture
Aluminum Window Walls	▫ Overall Condition: Fair to Good ▫ Units remain operable ▫ Glazing putty is cracked and deteriorated ▫ Aluminum surfaces are dirty ▫ Minor surface staining from corrosion of steel ▫ Concrete sills have isolated, minor hairline cracks
Clerestory Windows	▫ Overall Condition: Fair ▫ Some clerestory windows have been modified to accommodate HVAC ducts ▫ Some aluminum sun control louvers have been removed ▫ Glazing has been painted or boarded up to control light
Doors	▫ Overall Condition: Good ▫ Original wood doors at classrooms are in good condition ▫ Aluminum entry doors are in good condition ▫ Some steel doors are in poor condition with corrosion present
Roof	▫ Low-slope, single-ply membrane roofs are overall in Fair-to-Good condition ▫ Soffit and fascia boards are in good condition ▫ Parapets are in good condition ▫ Copper clad dome at Planetarium is in good condition
Appendages	▫ Overall condition of wood appendages is Fair-to-Poor ▫ Some wood outriggers have extreme wood decay
Canopy Roofs	▫ Overall condition of canopy roofs is fair ▫ Canopies with rooftop mechanical units most impacted – weight of units and ponded water has impacted the structure ▫ Concrete slabs exhibit significant cracking / settlement in some locations ▫ Wood and stucco ceilings are in good condition

Structural (ASCE 31-03 Tier 1 Screening)	▫ Overall condition of structural systems is good to fair ▫ Typical non-compliant items are related to wood diaphragms (roofs), moment frames at window walls, and wall anchorage at roofs and foundations ▫ Non-compliant, non-structural items include equipment anchorage and supports for light fixtures and tall and narrow furnishings
Mechanical	▫ Overall Condition: Fair ▫ Some units are new, others are past their service life ▫ Units at canopy roofs overload structure and cause excessive roof ponding
Electrical	▫ Overall Condition: Fair ▫ Many components are beyond their expected service life and need to be replaced ▫ Most lighting has been upgraded and is in good condition
Plumbing	▫ Overall Condition: Fair ▫ No leaks detected ▫ Some restrooms have been upgraded recently ▫ Some fixtures are showing extended signs of use
Fire and Life Safety	▫ Overall Condition: Good ▫ The means of egress (exits) is compliant except for a few classrooms ▫ Buildings 2 & 7 are the only buildings with fire sprinklers; sprinklers are not currently required at other buildings ▫ Fire alarms & extinguishers are in good condition; many manual pull boxes need to be relocated to inside of building
HazMat	▫ Visual survey identified potentially hazardous materials ▪ Asbestos-containing material (ACM) ▪ Lead based paints ▪ Mercury (Fluorescent light bulbs) ▪ Hydrochlorofluorocarbon (HVAC System) ▪ Polychlorinated biphenyls (Ballast at fluorescent fixtures, caulking ▪ Tritium gas ▫ Sampling has not been completed

Material Systems: Condition Assessment

This section identifies and describes a series of material systems that are common to four of the complexes on the Orange Coast College campus; Student Success Center and Classrooms & Labs complex (Buildings (Bldgs.) 7, 8, and 9), Business Education complex (Bldgs. 12, 13, and 14), Theater & Music complex (Bldgs. 2 and 4), and Math Wing and Planetarium complex (Bldgs. 35 through 39). These complexes have been identified as having similarities in design, construction techniques, and materials. In advance of addressing the condition assessments for each individual complex, the systems and materials common to the complexes have been grouped and illustrated in terms of their common features and common defects.

The Swimming Pool complex (Bldg. 93) and the Fieldhouse and Stadium complex (Bldgs. 105 and 110) have not been included in this section as they do not fit the systems described. There is however, some commonality of material and design within all complexes.

Exterior Walls

Brick Walls - Typical Features

Bearing Walls

Brick bearing walls are present at Buildings 2, 4, 7, 8, 9, 12 (Figure 3), 13, and 14 on multiple façades. The walls are constructed from two wythes of brick separated by a fully grouted collar joint (Figure 4). Horizontal and vertical steel reinforcing is located within the walls. The overall wall thickness is 9 inches.

Figure 3

Figure 4

The bonding patterns used for construction are running bond and 1/3 running bond. The brick units are an unusual size and shape being slightly larger than standard bricks at a height of 2 ¾ inches high (Figure 5). The brick color is fairly uniform pale red-orange with minimal fire skin resulting in a relatively 'soft' (porous) texture. In several locations wire cutting manufacture marks are visible on the faces of the brick (Figure 6).

Figure 5

Figure 6

The mortar joints are typically 5/8 inch in width. The horizontal mortar joints are concave, finished with a curved recess and a smooth surface, whilst vertical joints have been finished flush and exhibit more texture (Figure 5). The mortar is pale gray in color and aggregate-rich, with a cement binder.

Exterior wall surfaces are unpainted. However in areas where the walls are adjacent to landscaping a damp proof application with a painted black appearance is presently visible on the lower one or two courses of the brickwork.

Figure 7

Figure 8

Figure 9

Figure 10

Brick Walls - Condition

Bearing Walls and Brick Clad, Wood-Framed Walls

The overall condition of brick masonry walls is fair to good with localized bricks in poor condition.

Cracking: Minor hairline cracking appears on individual bricks in localized areas likely related to their manufacture (Figure 7). There is also localized cracking at the brick-mortar interface.

Missing pieces: Corners of brick broken on exposed ends of walls appear to have impact damage as observed at the corner of the west offshoot at Building 2 and the base of the wall at the east façade of Building 12.

Spalling: The fired face of brick has spalled off in isolated areas. The depth of spalls is generally 1/4 inch deep (Figure 8 and Figure 9).

Efflorescence: Localized areas of efflorescence at the base of walls appears to be related to landscaping where, in our experience, efflorescence is enhanced due to additional water from irrigation and the possible introduction of salts in fertilizers (Figure 8).

Biological colonization: Limited algal growth at base of walls associated with areas where water is concentrated, including where landscaping is adjacent to walls and in locations where rainwater control devices have failed.

Loss of surface finish: The damp proofing at the base of brick walls adjacent to landscaping is heavily deteriorated in all locations. It is either missing or patchy (Figure 10).

Previous repairs: Previous repairs to concrete window sills on the north façade of Building 8 have left unsightly deposits of cement slurry on the brickwork below.

Brick Walls- Typical Features

Brick Wing-Wall Canopy Supports

Brick wing-wall canopy supports are present on the south side of Buildings 12 (Figure 11) and 35 (Figure 12). The walls are 'check' shaped with the ends closest to the building façade that support the walkway canopy being short and perpendicular to the building façade and the larger portion of the walls oriented at an approximately 45 degree oblique angle to the façade oriented true north-south (Figure 13).

The brick construction and characteristics match the bearing walls. The walls sit on a visible concrete plinth and are capped by a cement-based mortar visually of the same composition of the collar joint mortar (Figure 14). There is no visible damp-proof application.

Figure 11

Figure 12

Figure 13

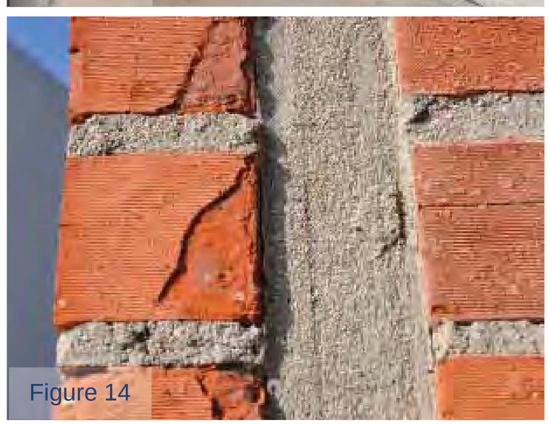

Figure 14

Figure 15

Figure 16

Figure 17

Figure 18

Brick Walls - Condition

Brick Wing-Wall Canopy Supports

The overall condition of the brick wing walls is fair with some isolated areas in poor condition.

Cracking: Similar to the brick bearing walls.
Corrosion: Corrosion of the mechanical fasteners attaching the walkway canopy on Building 35 to the wing wall has resulted in rust jacking causing loss of the surrounding brick and mortar (Figure 15).
Missing pieces: See 'corrosion' above.
Spalling: The fired face of the brick has spalled off in many areas on all wing walls which, in our experience, appears to have been enhanced by the actions of salts below the surface of the bricks. The depth of the spalls is generally 1/4 inch deep; a few spalls are as deep as 1-3/4 inches deep (Figure 16 - Figure 18).
Efflorescence: Efflorescence is visible in patchy areas on the lower halves of all wing walls commonly associated with spalled bricks. The efflorescence is mainly visible on the exposed porous surfaces of spalled bricks (Figure 16 - Figure 18).

Concrete Walls - Typical Features

Poured-in-Place Concrete

Poured-in-place concrete walls are a distinctive feature of two individual buildings - the Theater (Bldg. 2) and the Planetarium (Bldg. 39). The auditorium section of the Theater and the Planetarium building both have curved walls. There are several door openings in the poured-in-place concrete walls but no windows.

The concrete pour lines are well disguised but distinguishable at approx. 8 foot intervals (Figure 19). Vertically-oriented 1 inch x 4 inch, tongue and groove boards with an additional center “vee” were used to create a distinctive vertical raised rib detail at approximately (approx.) 2 inches on-center spacing (Figure 20 and Figure 21). According to the original drawings the walls contain steel reinforcing. The wall surfaces have an applied lightly-dashed surface texture and are painted (Figure 20).

Precast Tilt-up Concrete

Pre-cast tilt-up concrete walls are a distinctive feature of the Student Success Center and Classroom & Labs complex (Bldgs. 7, 8, and 9). The east façades of Buildings 7 (Figure 22) and 9, south façades of 8 and 9, and west façades of 7, 8, and 9 are precast tilt-up concrete.

The monolithic reinforced concrete slabs are joined in sections by steel Ts. The slabs are 5 inches thick. There are several door openings in these concrete walls but no windows. All surfaces and steel channels are painted.

Figure 19

Figure 20

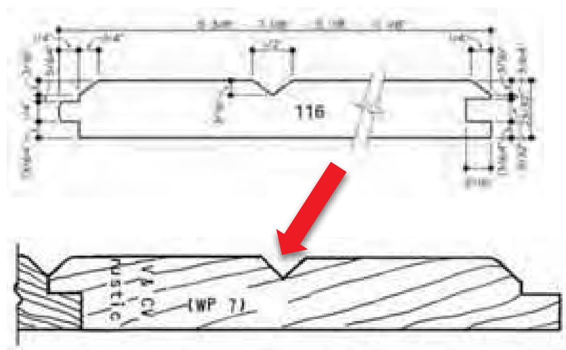

Figure 21

Figure 22

Figure 23

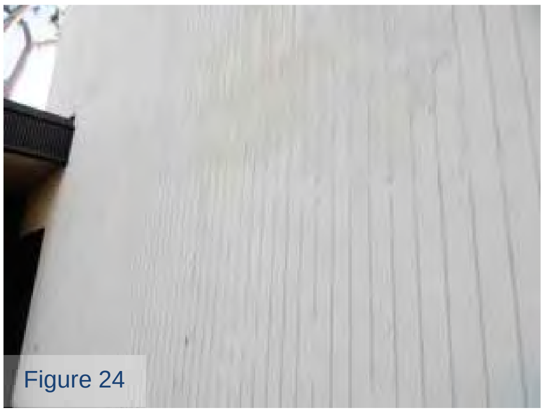

Figure 24

Figure 25

Figure 26

Concrete Walls - Condition

Poured-in-Place Concrete

The poured-in-place concrete is generally in good condition.

Cracking: An isolated fine diagonal crack with associated small scale paint and surface texture loss was identified on Building 2 (Figure 23). In our experience, this type of crack is associated with structural movement.
Corrosion: Minor rust staining was identified where the concrete is in contact with sheet metal (for example: at drip edges).
Biological colonization: There is widespread lichen growth on the parapet wall head of the Theater auditorium (Bldg. 2).
Loss of surface finish: Small scale loss of paint and surface texture occurs near parapet wall head and in the area associated with the crack noted above.
Previous repairs: An area (approx. 4ft x 8ft) of the concrete on the east side of the Theater auditorium (Bldg. 2) has a patchy appearance. It seems this location experienced a repair from the removal of a previous attachment (such as an awning) (Figure 24).

Precast Tilt-up Concrete

The precast tilt-up concrete is in good condition.
Corrosion: The steel Ts between tilt-up concrete panels on the exposed west ends of Buildings 7 and 9 have light surface corrosion at their bases (Figure 25). This does not yet appear to have affected the concrete.
Water damage: The west ends of Buildings 7 and 9 have a low level of soiling and paint loss at the bottom 6 inches of the walls associated with exposure to moisture (Figure 26).
Loss of surface finish: See ‘water damage’ above.

Stucco-Clad Wood-Frame Walls - Typical Features

The stucco-clad wood-frame walls are present at Buildings 2, 4, 35, 36, 37, 38, 39. In addition there is non-contributing stucco on the west addition of Building 7 and panelized stucco on the east addition to Building 2.

These walls are typically composed of 2 x 4 inch and 2 x 6 inch wood studs and finished with painted cement plaster over plywood shear panels (Figure 27 through Figure 30).

Figure 27

Figure 28

Figure 29

Figure 30

Figure 31

Figure 32

Figure 33

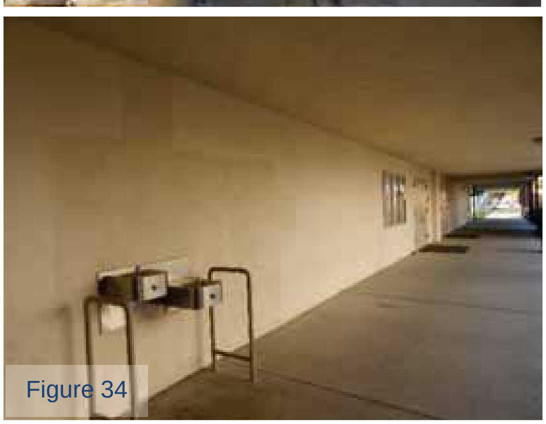

Figure 34

Stucco-Clad Wood-Frame Walls - Condition

The overall condition of the stucco-clad wood-frame walls is fair to good.

Cracking: A long horizontal crack on the west side of the original (north) part of the Music Building (Bldg. 4) at the transition from the concrete plinth to the stucco-clad wood-frame walls covered by stucco (Figure 31). Isolated cracks identified in non-contributing stucco additions at Buildings 2 and 7 (Figure 32- Bldg. 7).

Missing pieces: One corner missing on non-contributing west addition on Building 7 potentially as a result of impact or water damage.

Loss of surface finish: Minor paint/aesthetic damage to the base approximately 6 inches above grade of exposed walls on Buildings 35, 36, 37, 38 (Figure 33).

Previous repairs: Stucco patching around previous or new openings is visible at the east façade of Building 4 and south façade of Building 36 due to color and/or textural differences (Figure 34).

Wood-clad Walls - Typical Features

Plywood-Clad Walls

Plywood-clad walls originally had a clear varnish and are a finish detail uniting the contributing complexes on the campus; they are present on Buildings 2, 9, 12, 13, 35 (Figure 35), 36 (Figure 36), 37. These walls are commonly paired with doors, windows and storage areas and are only present below covered walkways. All of the external plywood has been painted.

Tongue and Groove Sheathing

Tongue and groove sheathing is only present at the entrance of the Theater auditorium (Bldg. 2) (Figure 37 and Figure 38). This tongue and groove matches the dimensions of the formwork texture on the surrounding board-formed poured-in-place concrete. The tongue and groove does not run to ground level; there is an approx. 6 inch base board. The doors are concealed with just the hardware visible. All tongue and groove detailing is painted.

Figure 35

Figure 36

Figure 37

Figure 38

Figure 39

Figure 40

Figure 41

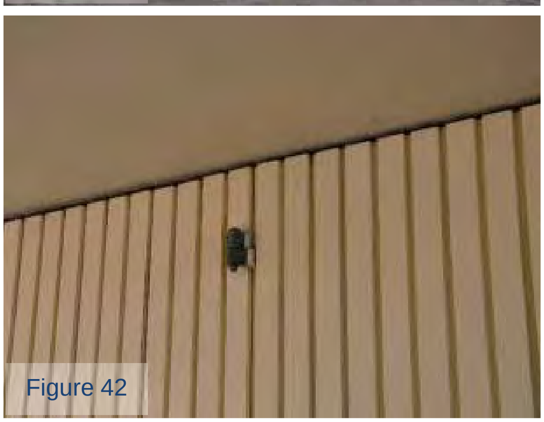

Figure 42

Wood-clad Walls - Condition

Plywood-Clad Walls

The plywood-clad walls are in fair condition (Figure 39) with most damage confined to their lower 6 inches. However, the painted surface obscures the condition of the plywood face underneath.

Water damage: The lower edges of plywood on most boards that reach the concrete slab are delaminated, swelling and splitting from exposure to moisture. This is generally limited to the lower 6 inches (Figure 40 and Figure 41).
Loss of surface finish: As well as small scale flaking of paint associated with areas of the plywood with water damage, limited areas of paint were lost in the center of panels. This is likely to be related to physical damage to the painted surface.
Poor original detailing: The proximity of plywood paneling to potential moisture exposure could be identified as poor original detailing.
Previous repairs: The plywood panels may have been painted as a previous repair if the exposed surfaces of the plywood were in poor condition. Alternatively, it could have simply been undertaken as an aesthetic alteration.

Tongue and Groove Sheathing

The tongue and groove sheathing appears to be in good condition. However, the painted surface obscures the condition of the wood face underneath (Figure 42).

Windows

Aluminum Windows - Typical Features

Window Walls

Multi-pane aluminum window walls are present on the north façades of Buildings 7, 8, 9, 12, 13, 35 and 36. They are set on an angle tilting out at the top (Figure 43a *left*). Each window wall is made up of a set of adjacent bays two panes wide and two to five panes high with steel mullions between (Figure 43b *right*). The bays are vertically oriented and the panes are horizontally oriented, the exceptions are Buildings 35 and 36 where every other bay has two-over-two panes, the upper panes being vertically oriented (Figure 44). The upper panes are two thirds of the height of the window. Each complex has a unique window configuration.

The windows have a combination of fixed and operable sections. Units with two-over-two or -three panes are fixed. The smaller panes tend to be the operable parts of the window; Buildings 35 and 36 are the exception where it is the larger panes in the two-over four panes that are operable. The operable units open from a top hinge, operation mechanisms vary. The glazing is tinted or coated. Below the windows are continuous concrete sills composed of concrete units the same width as the window panes and with a slurry coat to hide the unit divisions.

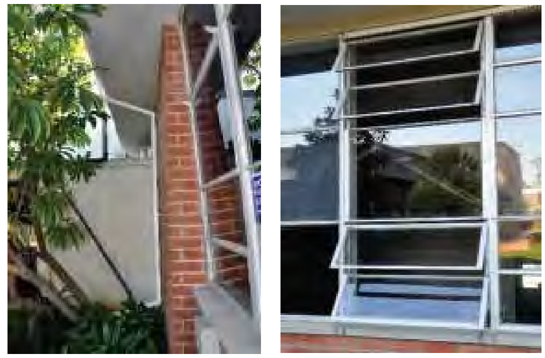

Figure 43 a & b

Figure 44

Figure 45

Clerestory Windows

Buildings 2 (Figure 45), 7, 8, 9, 12, 13, 35 and 36 have aluminum clerestory windows on their south façades. Building 2 also has clerestory windows on the north façade of the brick offshoot. Steel mullions are in place between pairs of windows similar to the window walls. Some of the clerestory windows are operable (locations not confirmed). The clerestory windows at Buildings 8 and 9 are covered by metal louvers (Figure 46). Concrete sills were present below the clerestory windows at Building 2.

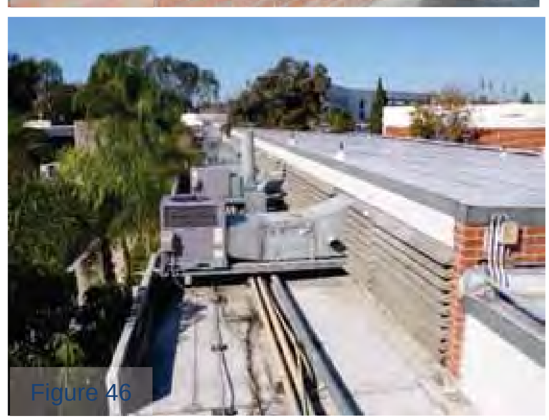

Figure 46

Figure 47

Figure 48

Figure 49

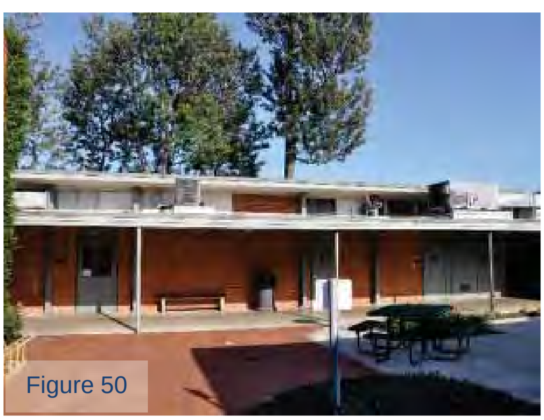

Figure 50

Aluminum Windows - Condition

The aluminum windows are in fair to good condition.

Cracking: The glazing putty is in poor condition and is heavily cracked in around 80% of all areas where present (Figure 47). Cracks are common running through the concrete sill in line with the concrete unit sections (Figure 48). These are generally hairline cracks, but up to 1/8 inch wide as measured on Building 8. On Building 7 crazing was identified on one sill; likely to be shrinkage cracks from the time of application.

Corrosion: The fasteners in the steel mullions were corroded in approximately half of the locations with limited associated rust staining below.

Missing pieces: A corner of the window sill was missing at Building 7, probably as a result of impact damage.

Pitting: The aluminum surface is lightly pitted and soiled in all locations (Figure 49).

Previous repairs: The clerestory windows are variously blocked, boarded up, and boxed in at around half of their locations. Some units have been replaced with mechanical ducts (Figure 50). Repairs to the concrete sill on the north façade of Building 8 have left a cementitious slurry residues in lumps on the sill and brickwork below.

Windows (other) - Typical Features

Wood-Framed Windows

Wood-framed windows are present at Buildings 12 and 37 (Figure 51) below covered areas. The frames are undetailed, wide, squared, painted wood. These windows are fixed-pane with tinted or coated glass in the larger windows and obscured glass in restroom clerestory windows at Building 37. The glass panes are large and vary in proportion. At the base of the windows are similarly undetailed, modest, painted wood sills.

Vinyl Windows

Vinyl replacement windows are present at the east façade of Building 35 (Figure 52). These are contemporary with sliding panes.

Jalousie Windows

Buildings 35 and 37 have small jalousie windows between clerestory windows with aluminum frames and steel mullions (Figure 53).

Louvers

Aluminum louvers are present as sun shields over aluminum-framed clerestory windows on the south façades of Buildings 8 (Figure 54), 9, and 37. Aluminum louvers for mechanical room ventilation are present on the north façades of Buildings 9b (Bldg. 9 annex) and 37.

Figure 51

Figure 52

Figure 53

Figure 54

Figure 55

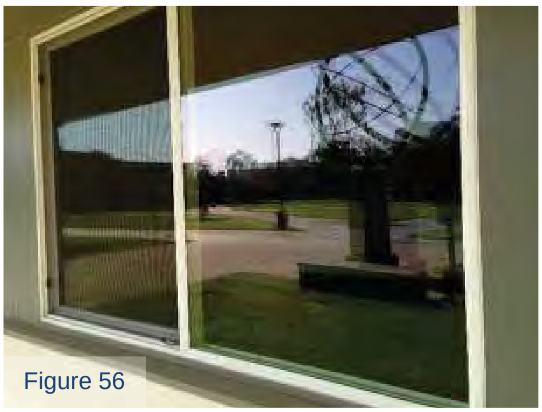

Figure 56

Figure 57

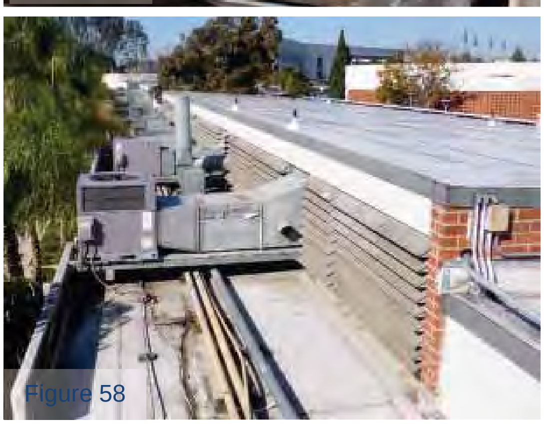

Figure 58

Windows (other) - Condition

Wood-Framed Windows

The wood-framed windows appear to be in good condition. However, the painted surface obscures the condition of the wood face underneath (Figure 55).

Vinyl Windows

The vinyl windows appear to be in good condition (Figure 56).

Jalousie Windows

The jalousie windows are in fair to poor condition.

Missing pieces: In one location on Building 36 one of the glass slats was missing (Figure 57).
Pitting: The steel mullion surface is lightly pitted and soiled in all locations.
Previous repairs: Some units have been replaced with mechanical (HVAC) ducts.

Louvers

The aluminum louvers are in a fair condition.

Corrosion: The fasteners in the steel mullions were corroded in approximately half of the locations with limited associated rust staining below.
Pitting: The aluminum surface is lightly pitted and soiled in all locations.
Previous repairs: All of the clerestory windows behind louvers are now either blocked, painted, or covered by dropped ceilings and are therefore no longer in use. Some of the louvers on Buildings 8 and 9 have been removed to install HVAC ducts (Figure 58).

Doors

Doors - Typical Features

Wood Doors

Exterior wood doors are present at Buildings 2, 7, 8, 9, 12 (Figure 60), 13, 14, 35 (Figure 59), 36, 37, 38, and 39. The wood doors are below walkway canopies or breezeways in all locations except for the double doors on the east façade of Building 7. The doors for restrooms and storage rooms commonly contain a louver at their base. Classroom doors have a full- or half-width glazed panel in the upper half. The doors are painted on all external surfaces.

Steel Doors

Steel doors are present on mechanical rooms at Buildings 2, 7 (Figure 61) and 39. These doors have integrated vents at their bases.

Non-ferrous Metal Doors

Modern non-ferrous metal and glass doors are present at Buildings 2, 4 and 7 (Figure 62).

Figure 59

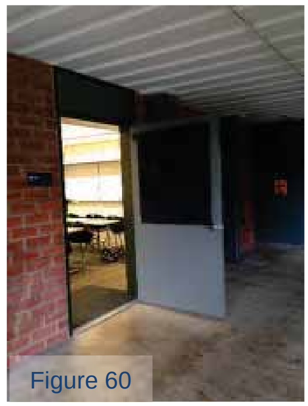

Figure 60

Figure 61

Figure 62

Figure 63

Figure 64

Figure 65

Figure 66

Doors - Condition

Wood Doors

The wood doors are in fair to good condition with most damage confined to their lower 6 inches. However, the painted surface obscures the condition of the wood face below.

<u>Wood-boring insect damage</u>: A door to the mechanical room at the north of Building 37 shows evidence of wood-boring insect (probably termite) damage.
<u>Water damage</u>: The lower edges of the doors are swelling and splitting from exposure to moisture. This is generally limited to the lower 6 inches (Figure 63).
<u>Loss of surface finish</u>: As well as small scale flaking of paint associated with areas of the plywood with water damage, limited areas of paint loss occurred in the center of panels (Figure 64). This is likely to be related to physical damage to the painted surface.

Steel Doors

The steel doors are in poor condition.

<u>Corrosion</u>: There is heavy corrosion at the base of all identified steel doors (Figure 65). On the steel door on the east façade of Building 7 there is also patchy, dispersed corrosion showing through the painted surface on the body of the door (Figure 66).
<u>Water damage</u>: See 'corrosion' above.

Non-Ferrous Metal Doors

The non-ferrous metal doors are generally new and in good condition.

Roofs

Low-Slope Roof - Typical Features

Low-slope roofs are common at all complexes. Shed roofs sloping to the north are present at Buildings 2, 4, 8, 9, 14, 38, and 39. Gabled roofs are present at Buildings 7, 12 (Figure 67), 13, 35, 36, and 37. Buildings 2, 38, and the Building 9 annex have low-slope roofs with parapet walls.

Membrane

All of the low-slope roofs have a single-ply pale gray/off-white membrane cover (Figure 68).

Flashing and Trim

Roof edges and parapet walls are finished with a sheet metal flashing and overlapping membrane.

Gutters and Downspouts

Gutters and downspouts are not present on most of the buildings. Building 7 has gutters and downspouts on the north and south façades but not in a consistent style. The Planetarium Building (Bldg. 39) has downspouts but no gutters. The roofs with parapet walls and some of the low slope roofs have integrated roof drains. Roofs sloping to the south drain onto the walkway canopy but gutters and downspouts are not present at roof level, nor on the canopies.

Eaves and Soffits

The buildings commonly have a wooden soffit below the flashing and on the north façades buildings 7, 8 (Figure 69) and 9 have stucco-boxed eaves and Buildings 12, 13, 35 and 36 have wood board closed eaves. On the south façade of Building 7 there are non-contributing stucco-paneled boxed eaves (Figure 70).

Other

Various mechanical equipment is attached to the low slope roofs.
Note: There are some later roof additions including a metal low slope roof (Bldg. 7) not addressed here (Figure 70).

Figure 67

Figure 68

Figure 69

Figure 70

Figure 71

Figure 72

Figure 73

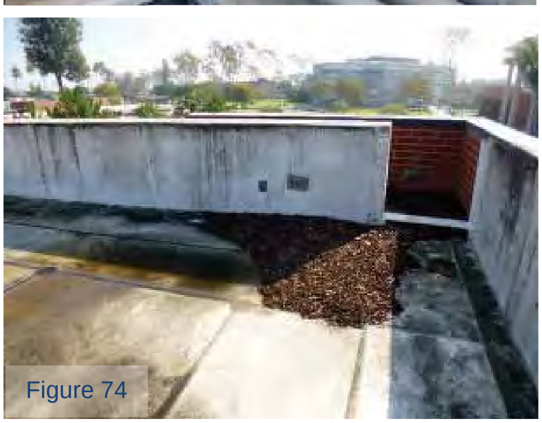

Figure 74

Low-Slope Roof - Condition

The low-slope roofs are in fair to good condition.

Cracking: A vertical crack runs through the boxed eaves at Building 8 at the connection to the addition. Fine isolated cracks have been identified in non-contributing stucco boxed eaves and additions at Building 7.
Corrosion: Gutters at Building 7 are heavily corroded and compromised. Vents and mechanical equipment commonly had a low level of surface corrosion near their bases.
Water damage: The soffits are lightly soiled with minor water damage in all locations (Figure 71).
Biological colonization: Flashing commonly has algal growth and light soiling. Areas of water pooling have algal growth.
Loss of surface finish: Paint is peeling from the parapet flashing at Building 37 and soffits (Figure 72).
Poor original detailing: A lack of gutters and downspouts has resulted in soiling of soffits. Internal drains have surrounding lips approx. ½ inch high preventing full drainage. In addition there are areas of water pooling, such as in the corner of the low offshoot at Building 2 (Figure 73) where internal drains are not present.
Maintenance issues: There is an accumulation of plant detritus on the roof of Building 37 within the parapet walls (Figure 74).

Other Roofs - Typical Features

Copper Dome

The small segmented copper dome is present at the Planetarium Building (Bldg. 39) (Figure 75 and Figure 76). The copper dome is surrounded by a low slope membrane covered roof.

Convex Roof

The theater auditorium roof (Bldg. 2) is a convex low-slope roof with a single-ply membrane cover (Figure 77). Between the edge of the convex roof and the concrete wall there is a deep integrated copper gutter (Figure 78). The gutter feeds into internal downspouts that exit into an open concrete gutter at the edge of the foot of the building to the north and out onto the low-slope roof to the south.

Figure 75

Figure 76

Figure 77

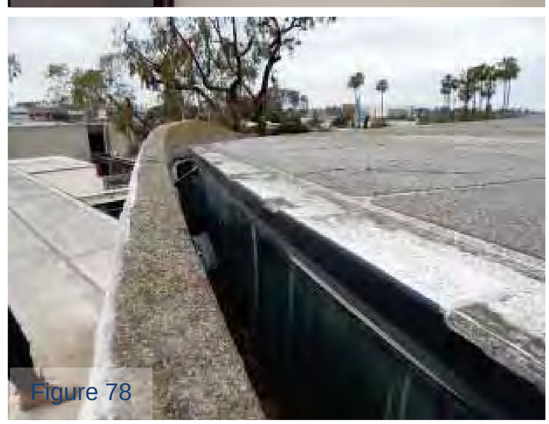

Figure 78

Figure 79

Figure 80

Figure 81

Figure 82

Other Roofs - Condition

Copper Dome

The copper dome roof is in fair to good condition.

Corrosion: Rust staining is visible below the copper flashing at the base of the roof around the full circumference (Figure 79). This could infer that there are issues with the condition of the concrete dome structure below. It is also likely to be related to the water pooling observed on the low slope roof surrounding the dome (Figure 80).

Convex Roof

The convex roof is in fair to good condition (Figure 81).

Maintenance issue: Accumulation of plant detritus in gutter (Figure 82).

Appendages

Covered Walkways - Typical Features

Covered walkways are present at all complexes discussed in this section.

Roof

All walkway canopies have low-sloping membrane-covered roofs. The canopies are directly attached to the neighboring building façades positioned below clerestory windows where present or flush with low one-story building roofs (Bldgs. 2 and 4). Walkway canopies carry the HVAC units for adjacent buildings (Figure 83).

Sides

The exposed edges of the canopies have a wooden fascia trim and either an attached or an integrated gutter with multiple downspouts leading directly into the ground. The wood fascia projects outwards from the canopy at the ends of Buildings 12, 13, 35 as a design detail (Figure 84). The walkway to the north of the theater (Bldg. 2) has stucco at the sides.

Ceilings

The walkway ceilings, originally stained or varnished, are commonly painted board and batten on the east-west walkways (Figure 85) and tongue and groove on the north-south walkways; the exceptions being Buildings 2 and 4 where the ceilings have a stucco finish.

Supports

The common walkway support system is a series of round, coated metal columns (Figure 86).

Floors

The paving below the canopies is poured concrete slab.

Figure 83

Figure 84

Figure 85

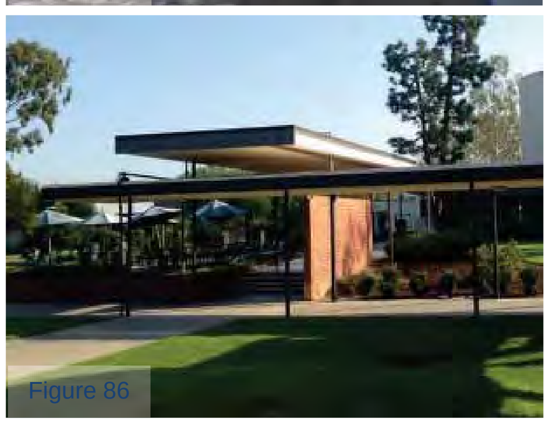

Figure 86

Figure 87

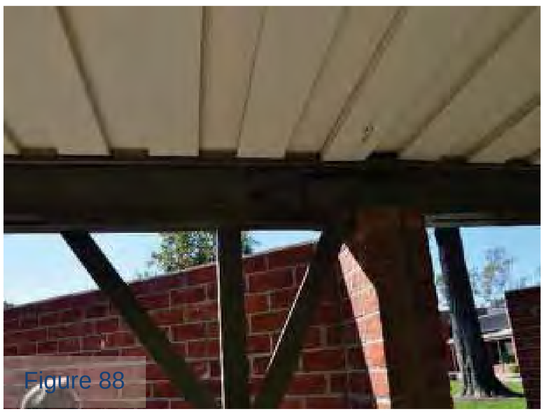

Figure 88

Figure 89

Figure 90

Covered Walkways - Condition

The covered walkways are in fair condition with some isolated areas in poor condition.

Cracking: Cracking, associated with deterioration of the wood fascia at Buildings 9, 12, and 13, is present in a few isolated locations. The slab is cracked in the majority of locations although this does not appear to be posing a trip hazard at present (Figure 87).

Corrosion: Corrosion of a connector between the canopy and brick wing wall at Building 35 has resulted in loss of material from the brick wing wall.

Wood decay: Wood decay, affecting limited areas of the wooden fascia at Buildings 9, 12 (Figure 88), and 13, is resulting in a significant weakening of the structure.

Wood-boring insect damage: An area showing evidence of wood-boring insect damage (probably termite damage) was identified in the wood fascia at Building 9 where the canopy attaches to the Building 9 annex.

Water damage: The wooden fascia and flashing are commonly soiled and have minor water damage.

Previous repairs: The addition of rooftop HVAC units is causing the canopy roof structures to sag, most notably at Buildings 35 and 36 (Figure 89). Water is pooling atop the canopies and adding additional weight in these areas. Deterioration of the strength of the canopy sides and/or supports at Buildings 9, 12, 13, 35 has required the addition of extra wooden supports and metal plates.

Maintenance issues: The canopy roofs commonly have some level of accumulation of plant detritus on the roofs and in the gutters (Figure 90).

Miscellaneous Features - Typical Features

Trellis between Buildings

There are trellises present at the north sides between Buildings 8 and 9, and Buildings 12 and 13.

The trellis between Buildings 8 and 9 is attached to a boxed stucco-finished structure supported on steel columns at the north edge of the buildings. The trellis projects to the south with steel rafters supporting wooden slats (Figure 91).

The trellis between Buildings 12 and 13 projects to the north from the edge of the roof line supported by wooden beams or rafters and with metal slats and framework (Figure 92).

External stairs

Two external staircases, one over the other, are present on the east façade of Building 37 running parallel and adjacent to the building façade (Figure 93). A brick wall surrounds the lower steps (Figure 94) and the top portion of the upper steps. A gate blocks access to the roof at the upper section of the upper stairs; the gate is in line with the edge of the brick wall. The upper staircase has metal railings and handrail on the outer edge.

Figure 91

Figure 92

Figure 93

Figure 94

Figure 95

Figure 96

Figure 97

Figure 98

Miscellaneous Features - Condition

Trellis between Buildings

The trellises are in fair to poor condition.

Wood decay: One rafter adjacent to the north face of Building 13 is significantly decayed and the support for the trellis is compromised (Figure 95). The beam to the east of this appears to have been cut short possibly indicating that it had previously been in poor condition and the deteriorated wood has been removed

Other: The wooden slats at the trellis between buildings 8 and 9 have warped and are no longer straight (Figure 96).

External stairs

The external stairs are in good condition (Figure 97).

Maintenance issue: There is an accumulation of plant detritus at the upper part of the upper steps potentially increasing the accumulation of water (Figure 98).

Building Complex Condition Assessments

This section presents the results of the condition assessments for each of the six complexes contributing to the Historic District; Student Success Center and Classroom & Labs complex (Bldgs. 7, 8, and 9), Business Education complex (Bldgs. 12, 13, and 14), Theater & Music complex (Bldgs. 2 and 4), Math and Planetarium complex (Bldgs. 35 through 39), Swimming Pool complex (Bldg. 93) and Fieldhouse and Stadium complex (Bldgs. 105 and 110). The complexes are reported on in order of date of construction.

The condition of the exterior architectural features and building systems – structural, MEP, fire and life safety, environmental, and disabled access – are summarized in tables at the beginning of each complex condition assessment. Following this is a brief architectural description of the buildings in each complex (full architectural descriptions can be found in Part 1C: ‘Physical Description’). The conditions assessments include summaries of the consultants’ reports for the structural system, MEP systems, fire and life safety, and hazardous materials. Each building complex condition assessment is organized as follows:

- Structural System
- Exterior Closure
- Interior
- Plumbing
- Mechanical (Heating, Ventilating, and Air Conditioning (HVAC))
- Fire and Life Safety
- Electrical
- Hazardous Materials (HazMat)

The conditions assessments undertaken by Page & Turnbull for the exterior closures and interiors, as described in this section, give details of all notable defects observed during the condition survey. Building 14 in the Business Education complex was not fully documented due to the original portion of the building having been largely consumed by an addition in 1977; however the original part of the building remains largely intact in the north east corner (as highlighted on the Figure 2: campus map).

Buildings 7, 8, 9 | Student Success Center and Classroom & Labs Complex

Figure 99: North façade of Student Success Center (Bldg. 7) west wing with clock tower and part of Classrooms & Labs (Bldg. 8).

Brief Physical Description

The Student Success Center (SSC) and Classroom & Labs (C&L) complex is a collection of four single-story buildings (Buildings 7, 8, 9, and 9b) at the southeast corner of the Historic District. Buildings 8 and 9 have rectangular plans while Building 7 joins two, offset rectangular wings at a hinge point. The west wing of Building 7 is south of Building 8 and they are connected by a covered walkway between the west end of the south façade of Building 8 and the west end of the north façade of the east wing of Building 7.

The buildings have wood-framed, tilt-up concrete, and reinforced masonry walls constructed on concrete wall footings. The north façades of all buildings have aluminum-framed window walls over low brick walls. There are aluminum-framed clerestory windows on the south façades of all buildings with the exception of the east wing of Building 7. The clerestory windows at Buildings 7 and 8 are covered by aluminum louvers. The east wing's west façade has full-height fixed aluminum-framed windows. Doors on Buildings 7 and 8 are primarily on the north façades with secondary entrances on the south façades. Building 9 is accessed only from the south façade.

All three buildings have low-slope membrane-covered shed roofs tilting to the north. Building 7 includes a non-original shed roof added on its south side creating the appearance of a gabled roof.

Building 9b is a small annex building south of Building 9. It has brick bearing walls at the east, south and west and plywood-clad walls at the north. This building has a flat roof with parapet walls.

A full architectural description can be found in Part 1C: 'Physical Description.'

Complex Condition Summary

The Student Success Center and Classroom & Labs complex is generally in fair to good condition with minor material defects. The tables below summarize the exterior architectural condition (Table 4) and the condition of the building systems (Table 5).

Table 4: Table summarizing the exterior architectural conditions at the Student Success Center and Classroom & Labs Complex. [iv]

Exterior Architectural Conditions														
	Walls			Windows			Doors			Roofs

1. Addition to west end and stucco on eaves.
2. Louvers on façade above walkway canopy.
3. Louvers for ventilation on mechanical room, north façade, Building 9b.
4. Non-ferrous metal doors.
5. Steel-framed clock tower.
6. Awning between Buildings 8 & 9, north side.

[iv] G = good condition, F = fair condition, P = poor condition (see Table 1 for details).

Table 5: Table summarizing the building systems conditions at the Student Success Center and Classroom & Labs Complex.[v]

Building Systems																	
		Structural			MEP			Fire / Life Safety		Environmental[14]					Disabled Access		
		Vertical	Lateral	Non-Structural	Mech.	Elec.	Plumb.	Fire	Life Safety	ACM	Lead Paint	Mercury	HCFC	PCB	Site	Entry Doors	Other
Condition	Bldg																
	7	G	F[1]	F[4]	F/P[6]	F[7/9]	F	G/F[10/11/12]	G	✓	✓	✓	✓	✓	G	G	-
	8	G	F[2]	F[4]	F	F[8/9]	F	G/F[11/12/13]	G	✓	✓	✓	✓	✓	G	G	-
	9	G	F[3]	F[5]	F	F[8]	F	G/F[11/12/13]	G	✓	✓	✓	✓	✓	G	G	-

Notes:

1. Inadequate precast wall panel connections, and inadequate steel braced frames.
2. The number of steel braced frame bays in each line is redundant, inadequate precast wall panel connections inducing cross-grain bending in wood ledgers, wall panels not adequately connected to the foundation, inadequate steel braced frames, covered walkway canopy wood framing supporting mechanical equipment showed signs of moderate deterioration, infill walls in moment frames are not isolated properly, and unacceptable drift at moment frames.
3. Infill walls in moment frames are not isolated properly, unacceptable steel moment frames, there are typically no cross ties between diaphragm chords, inadequate wall anchorage of precast concrete wall panels and reinforced masonry walls to diaphragm, inadequate precast wall panel connections inducing cross-grain bending in wood ledgers, and wall panels are not adequately connected to the foundation.
4. Unanchored tall narrow contents, deterioration is typical at wood support framing at units.
5. Screen projectors typically are not adequately braced.
6. The equipment within this building appears be old and past its life expectancy.
7. *Code Violation*: there is a water heater that is in the clearance of the existing 800A distribution panel.
8. Replacement of older Zinsco panelboards recommended.
9. It should be noted that any demolition should consider the interconnection of the electrical distribution systems between buildings 7 and 8. If building 7 were to be demolished, building 8 would be affected.
10. Ceiling tiles in many locations need to be replaced to ensure proper sprinkler coverage.
11. Fire hose reels not required, if kept should be fed from dedicated fire water supply.
12. Manual fire alarm boxes needed on the interior of the building located next to each exit door.
13. Building does not currently have sprinkler system.
14. Hazardous Materials assessment consists of visual survey only. Sampling is required to confirm presence.

Structural Condition Assessment

The following is a summary of the findings from the structural evaluation of Buildings 7, 8 and 9 by Risha Engineering (see Appendix 3: Structural Evaluation for full report).

---

[v] G = good condition, F = fair condition, P = poor condition (see Table 1 for details), ✓ = present.

Building 7 – Student Success Center

Building 7 is a one story structure consisting of a steel framed roof with wood sheathing supported on wood framed, precast concrete and reinforced masonry walls. The walls act as shear walls.

The building is in generally good condition. Precast panels contain noncompliant connections to the diaphragm, and steel braced frames are noncompliant. The building's close proximity to adjacent unattached structures is noncompliant. Non-structural items that are noncompliant are: unanchored tall narrow building contents; deteriorated mechanical anchorages; improperly braced fire suppression piping, and flexible couplings are not provided.

Buildings 8 & 9 – Classroom and Labs

Buildings 8 and 9 are one story structures consisting of a steel framed roof with plywood sheathing supported on steel columns, precast concrete walls or reinforced masonry walls which in turn are supported by the continuous concrete grade beam and piles. Steel moment frames and braced frames, in conjunction with the walls, provide the lateral force resisting system.

The buildings are generally in good condition, although walkway canopy framing exhibits deterioration in some locations. The building's close proximity to adjacent unattached structures is noncompliant. The steel moment frames and braced frames are noncompliant, precast wall panel anchorage to the roof diaphragm and wood ledgers are noncompliant, the precast wall panel foundation connections are noncompliant, and lack of cross ties in the roof diaphragm is noncompliant. Non-structural items that are noncompliant are: tall narrow building contents are unanchored; mechanical anchorages are deteriorated, and; fire suppression piping is not braced properly, and flexible couplings are not provided.

Exterior Closure Condition Assessment

Exterior Walls

Brick Walls

The brick walls in the SSC and C&L complex are in fair condition with localized areas of deterioration.

Hairline cracking was noted on bricks on the north façade of the west wing of Building 7 in fewer than 5% of the bricks. In our experience this is likely to be related to the brick manufacturing.

Spalls were noted in localized areas on the east façades of Buildings 7 and 8, and on the south façade of the Building 9 annex (Bldg. 9b) and the stand-alone wall. The spalling on Buildings 7 and 8 and the stand-alone wall was focused at the corners of the bricks, including approximately 10% of the bricks on these façades (Figure 100). The spalling at Building 9b involved thin spalls from large areas of the brick surfaces and approximately 20% of the bricks on this façade.

The bond at the brick-mortar interface is poor in a few isolated locations on Buildings 7 and 8. On Building 8 a crack was running along the brick-mortar interface up several courses at the north end of the east façade which indicates structural movement.

Algal growth was identified in patches at the base of the brick walls where the gutters above are failing on the south façade of the east wing of Building 7, and where there are no drains at the base of the downspouts on the south façade of the west wing of Building 7. There was also algal growth at the base of the north façade of the east wing.

The damp-proof coating at the base of the wall on Building 7 is heavily deteriorated in all locations (Figure 101).

Below the breezeway between Buildings 7 and 8 the plaster over the brickwork on Building 7 is chipped at the corner and the paint over the brickwork on Building 8 is peeling near the east corner.

Poor repairs have been undertaken at the window sills on the north façade of Building 8 resulting in cement slurry having been allowed to coat an area of the brickwork below (Figure 102).

On the north elevation of the east wing of Building 7 the integrated vent is warping and displaced, resulting in fracturing the neighboring brick (Figure 103).

On the large addition to the south of Building 7 the area below a water faucet has a heavy amount of lime staining.

Figure 100: Spalling brickwork on the east façade of Building 8.

Figure 101: Deteriorating black painted damp proof course on the east façade of Building 7.

Figure 102: Cement slurry coating brickwork below concrete sill.

Figure 103: Integrated vent on the north façade of the east wing of Building 7 with fractured brickwork.

Concrete Walls

Precast, Tilt-up

The tilt-up concrete walls are in fair to good condition. The steel channels between tilt-up concrete panels are showing signs of surface corrosion at their bases on the west façades of Buildings 7 and 9 (Figure 104). At the base of the same elevations there is a low level of paint peeling or blistering and some light soiling. On the northern panel on the west façade of Building 9 there is a crack along the join between the concrete foundation slab and the concrete tilt-up panel (Figure 105).

Figure 104: Corrosion at the base of the concrete channels between tilt-up concrete panels on the west façade of Building 7.

Figure 105: Crack/separation from the foundation slab at the base of the west façade of Building 9 and corrosion at corner.

Stucco-Clad Wood-Frame

The stucco-clad wood-framed walls are in poor condition.

The non-contributing wood-framed stucco walls of the addition on the west end of Building 7 are in poor condition with a crack that has previously been repaired above the door on the north façade, paint blistering, missing material from the lower northwest corner, and light soiling (Figure 106 and Figure 107).

Figure 106: Blistered paint, soling and missing stucco on the north façade of the addition to Building 7.

Figure 107: Crack at the top of the door frame on the north façade of the addition to Building 7.

Wood-clad Walls

Plywood-Clad Walls

Plywood on the north façade of Building 9 annex is in good condition, although it has been painted, obscuring its original natural finish.

Windows

Aluminum Windows

The aluminum windows in the SSC and C&L complex are in fair condition. All aluminum frames and louvers have a dull patina with a low level of surface pitting. The glazing putty is cracked around all panes (Figure 108) and a few areas (less than 5%) have lost their putty entirely.

Approximately half of the fasteners within the window mullions on the north façades of each building as well as in the louvers on the south façades of Buildings 8 and 9 have corroded.

The window on the east façade of Building 8 has a corroded steel bracket at the top of the mullion.

The concrete sills are cracked at the joints between concrete units, in approximately 75% of these joint locations, with cracks up to 1/8” wide as seen on the north façade of Building 8 (Figure 109). A lower corner of a window sill on the north façade of the east wing of Building 7 has been lost. There appears to have been a phase of window sill repair undertaken on the north façade of Building 8 which has left the sill with a patchy finish and drips of cement on the sill as well as cement slurry coating some of the brickwork below (Figure 102).

Figure 108: Cracked glazing putty on the north façade of Building 9.

Figure 109: Cracked window sill on the north façade of Building 8.

Exterior Doors

Wood Doors

The wooden doors are generally in good condition. One door at the far west end of the north façade of Building 9 has water damage at its base causing paint loss and the wood to split and swell (Figure 110). The door at the west end of the north façade of Building 9b had a low level of water damage. The double doors on the east façade of Building 7 have a small area of paint loss.

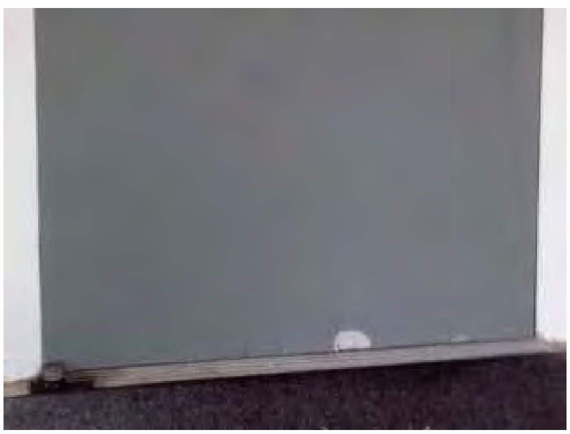

Figure 110: Door at the west end of the south façade of Building 9 with water damage to the base causing splitting and peeling paint.

Steel Doors

The steel doors are in poor condition. The steel door on the east façade of Building 7 has small patches of corrosion across the body of the door showing through the paintwork (Figure 111). The steel doors on the more recent additions to Building 7 have heavy corrosion at their bases (Figure 112).

Figure 111: Corrosion showing through the paintwork on the steel door on the east façade of Building 7.

Figure 112: Heavy corrosion at the base of the door on the north façade of the addition on the west end of Building 7.

Non-Ferrous Metal Doors

The non-ferrous metal doors are in good condition.

Roofing

Low-Slope Roof

The low-slope roofs at the SSC and C&L complex are in fair condition with minor issues of deterioration. The capping near the edges of the metal roof is corroding in patches and some of the paint/coating is peeling (less than 5% of area) (Figure 113). Roof mounted vents, fasteners and HVAC units have corrosion around their bases.

There is an accumulation of plant detritus in some areas of the metal roof.

The gutters on the south façade of the east wing of Building 7 are heavily corroded through their thickness and are no longer functional (Figure 114). The downspout on the north façade of the east wing of building 7 has a large incision made through it and it is corroded.

The wood-framed stucco-finished boxed eaves all have light soiling and algal growth in patches (Figure 115). On Building 8 the stucco is cracked on both the north and south façades at the line of the building addition (Figure 116).

Figure 113: Plant detritus accumulation and paint peeling from the metal roof on Building 7.

Figure 114: Heavily corroded gutter on south façade of east wing of Building 7.

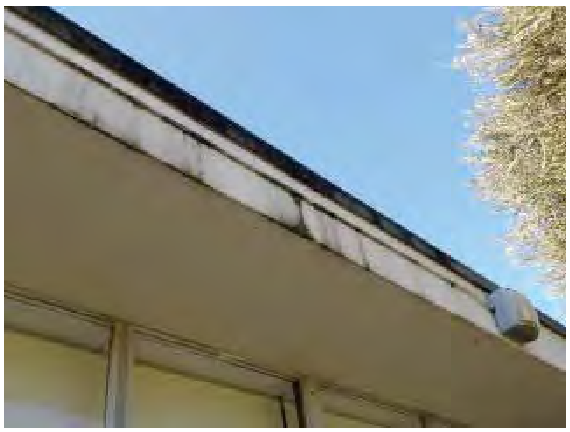

Figure 115: Soiling and algal growth on the north façade of Building 8.

Figure 116: Crack running through the face of the soffit on the south façade of Building 8 at the line of the building addition.

Covered Walkways

The covered walkways at the SSC and C&L complex are in fair condition.

There was a small amount of plant detritus on the walkway roofs and algal growth where water was seen to pool in small patches. Multiple pipes run along the walkway roof, some of which were seen to have corroded.

The wood soffit was observed to have rotted at the point at which it intersects with Building 9b (Figure 117). Significant material has been lost and a new support and base plate has been added to stabilize the area. A few small cracks are present in other locations.

In one location a small area of the ceiling is delaminating or the paint is peeling.

The segmented concrete paving slab that runs below the covered walkway has a meandering crack running down the center through several sections (Figure 118). This crack and other minor cracks are not observed to pose a trip hazard.

Evidence of wood-boring insect (probably termite) damage was present in one location on the soffit neighboring Building 9b.

Figure 117: Wood decay in the walkway soffit at Building 9.

Figure 118: Cracks in the concrete slab neighboring Building 9.

Miscellaneous Features

Trellis Between Buildings

The trellis and stucco boxed eave between Buildings 8 and 9 are in fair to good condition. There is a low level of patchy soiling and algal growth on the flashing and stucco sides (Figure 119) and a couple of the wood slats in the trellis are warped (Figure 120).

Figure 119: Algal growth and light soiling on the flashing and stucco sides of the trellis and boxed eaves between Buildings 8 and 9.

Figure 120: Slight warping of some of the wood slats on the trellis between Buildings 8 and 9.

Interior Condition Assessment

Buildings 7, 8 and 9 are predominantly classrooms and office space plus storage rooms, restrooms and two x-ray rooms in Building 8. Internal walls are tilt-up concrete walls, drywall partitions, and occasional painted or exposed brick. On the exposed brickwork inside office C in Building 8 there is efflorescence on small isolated areas of brick (Figure 121).

There are suspended ceilings with acoustical tile systems. Areas of water staining were observed on the acoustical tile in rooms 102 (Figure 122), and 1237 in Building 7. The ceiling tile in rooms 103A and 103B is sagging and coming out of its framing (Figure 123).

Flooring is mainly carpet other than linoleum in the lab spaces and tile in the restroom. The carpet in Building 9 room 112 was considered to be in poor condition due to staining. The linoleum in the south x-ray room in Building 8 was damaged and in poor condition (Figure 124).

In Building 8 room 106 it was observed that the windows to the north were screwed shut and the clerestories had been painted over.

In Building 9 original chalk boards and tack boards are still present behind modern dry erase boards although the visible area shows some loss of surface (Figure 125). The storage room in Building 9b contains some original built-in shelving.

Figure 121: Efflorescence on exposed brickwork inside Office C, Building 8.

Figure 122: Areas of water staining on the acoustical tile in Room 102, Building 7.

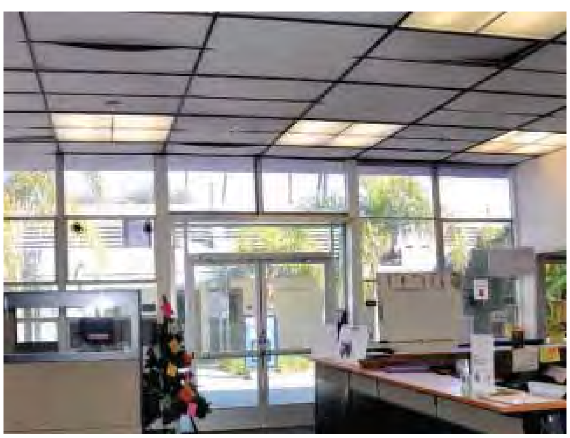

Figure 123: ceiling tile sagging and coming out of its framing in Room 103B, Building 7.

Figure 124: Damaged linoleum flooring in x-ray room South, Building 8.

Figure 125: Damaged chalkboard behind modern white board in Room 111, Building 9.

Plumbing Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

- The restrooms in this area are in fair condition; the fixtures are starting to show signs of extended use. No major defects or leaks were visible from the fixtures.

Mechanical (heating, ventilating, and air conditioning) Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

Building 7 – Student Success Center

Building 7 has a dedicated chiller, tower, boiler and multizone air handling unit (AHU) unit. The equipment within this building appears be old and past its life expectancy.

- The hydronic hot water boiler is a Raypak Boiler, 546,000 BTU/H input with a 2 HP base mounted pump system circulation pump. Boiler is in fair condition
- The air handler is a custom 4* pipe multizone Trane Climate Changer.
- The chiller is a Trane CG*60D 60 ton chiller, with a 10 hp base mounted end suction pump. The pipe insulation has a lot of repair tape over the existing insulation and shows signs of leaking water.
- The cooling tower is a RSD*070 fiberglass cooling tower with a 1.5 hp fan motor.
- The building also has ceiling mounted fan coils that are tied to the chiller and boiler and are in fair to good condition
- The building has an old Honeywell EMS system that should be replaced and updated with a newer current direct-digital-control (DDC) system.

Building 8 – Classroom and Lab

Building 8 has ductless split systems that serve the office area and rooftop gas units (RTU). The RTU serve the classrooms. There is one RTU per classroom.

- The ductless split systems consist of a wall mounted fan coil located within each office. The condensing unit is located on the roof. The systems appear to be in fair condition and are about half way thru their life expectancy.
- The RTUs for the classrooms are located above the covered walkway foyer and have side discharge ductwork within the classrooms. The RTUs range from three to five ton units and are in fair condition.

Building 9 – Classroom

Building 9 is similar to building 8 classrooms with rooftop gas units (RTU) that serve the classrooms. There is one RTU per classroom. The units are in fair condition.

Fire and Life Safety Assessment

The following is a summary of the visual examination undertaken by Jensen Hughes of the fire protection systems and life safety features of the facilities at Buildings 7, 8, and 9 (see Appendix 5: 'Fire and Life Safety Evaluation' for full report). No system testing or intrusive inspections were conducted by Jensen Hughes personnel.

Table 6: Student Success Center and Classrooms & Labs complex fire protection/life safety systems- the following table shows the surveyed buildings in the complex identifying the systems currently provided.

Bldg. No.	Building Name	Sprinklered	Fire Alarm	Fire Extinguisher	Fire Hose Reel	Adequate Egress	Comments
7	SSC	Y	Y	Y	Y	Y	-
8	C&L	N	Y	Y	Y	Y	-
9	C&L	N	Y	Y	Y	Y	-

Note: N means the system is not provided for the building. Y means the system is provided for the building.

Table 7: Observations on the fire protection/life safety systems at the Student Success Center and Classrooms & Labs complex made during the 2015 survey.

Item No.	Bldg. No.	Bldg. Name	System	Observation
1	7	SSC	Fire Sprinkler	The spare fire sprinklers do not match the currently installed sprinklers in the building.
2	7	SSC	Fire Sprinkler	The ceiling tiles in many locations appear to have some sort of damage leaving gaps around sprinkler escutcheons.
3	7	SSC	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building.
4	7	SSC	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ.
5	8	C&L	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building.
6	8	C&L	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ.

7	9	C&L	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building.
8	9	C&L	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ.

Electrical Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

The electrical system for both Buildings 7 and 8 are located within Building 7. Building 9 is fed from a separate 4160 volt feed. The electrical switchgear is aged but appears to be in good working condition at Building 7. There are older panelboards within the classrooms that are beyond their useful life expectancy and should be replaced. Lighting is primarily T*8 fluorescent. There is abandoned 4160V equipment that should be removed. The buildings are equipped with wall mounted emergency battery lighting units and have some illuminated exit signs.

Building 7 – Student Success Center

Buildings 7 and 8 are fed from two 5 KV switches providing 4160 volts to two transformers. The first is a 150 KVA transformer that delivers 480 volt, 3*phase, 3*wire power to the motor control center, which primarily feed the HVAC equipment. The second is a 300 KVA transformer that provides 800 amps of 120/208 volt, 3*phase, 4*wire power to local distribution. There are some older Zinsco panelboards that are original to the building and should be replaced, along with newer load centers that could be reused. The existing motor control center consists of fuses and HOA controls which have most likely been bypassed with the installation of the EMS. There are abandoned 4160V switches with exposed cabling that has been cut that should be removed.

Lighting is primarily T*8 fluorescent using an EMS system by Edward's Tech with occupancy sensors, timers and typical switches and outlets. The building is equipped with wall mounted emergency battery lighting units. The building has illuminated exit signs. There is a water heater that is in the clearance of the existing 800A distribution panel, which is a code violation. No mechanical ventilation was found in the transformer room at the north side of the building.

Building 8 – Classroom and Lab

The electrical system is fed from Building 7 providing 400 amps of 120/208 volt, 3*phase, 4*wire power. There are some older Zinsco panelboards that are original to the building and should be replaced, along with newer load centers that could be reused.

Lighting is primarily T*8 fluorescent using an Edward's Energy Management System (EMS) with occupancy sensors in some locations with typical switches and outlets. The building has a limited amount of emergency lighting or illuminated exit signs. This building does not have a noted emergency generator.

Building 9 – Classroom

The electrical system is fed from a 5 KV switch providing 4160 volt power to a 500 KVA transformer that delivers 1600 amps of 120/208 volt, 3*phase, 4*wire power to Distribution Board DPS. The switchgear appears to have been recently installed and is in good working condition. There are some older Zinsco panelboards that are original to the building and should be replaced, along with newer load centers that could be reused.

Lighting is primarily T*8 fluorescent using an Edward's EMS system with motion switches in some locations with typical switches and outlets. The building is not equipped with emergency lighting. Exit signs are present. This building does not have an emergency generator.

It should be noted that any demolition should consider the interconnection of the electrical distribution systems between buildings 7 and 8. If building 7 were to be demolished, building 8 would be affected.

Hazardous Materials (HazMat) Assessment

A visual survey was carried out in the Student Success Center and Classroom & Labs complex by Omega Environmental Services Inc. to identify the potential presence of hazardous materials (full report in Appendix). Based on the visual observations made during the limited assessment it is Omega's professional opinion that the following potentially hazardous materials may be present in the subject buildings:

Building 7 – Student Success Center

Table 8: Table identifying potentially hazardous materials at Building 7.

Asbestos-containing material (ACM)	▫ 1'x1' acoustic ceiling tile with associated mastic ▫ 2'x4' acoustic ceiling tile ▫ Drywall and joint compound with rough texture ▫ Vinyl base cove mastic ▫ Carpet mastic ▫ Vinyl floor covering (12" x12" tiles) and associated mastic ▫ Fireproofing on structural members ▫ Grout ▫ Insulation, registered ▫ Exterior Window putty ▫ Exterior paint/skim coat ▫ Exterior stucco ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic ▫ HVAC system components
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Ceramic tiles ▫ Toilet bowls, Sinks & Urinals

	▫ Floor drain ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

Building 8 – Classroom & Laboratory

Table 9: Table identifying potentially hazardous materials at Building 8.

Asbestos-containing material (ACM)	▫ 2'x4' acoustic ceiling tiles ▫ Drywall and joint compound ▫ Vinyl base cove and mastic ▫ Carpet mastic ▫ Vinyl floor covering (12" x12" tiles) and associated mastic ▫ Vinyl sheet flooring ▫ Counter top ▫ Mastic under sink ▫ Transite panels ▫ Exterior Window putty ▫ Exterior stucco ▫ Exterior paint/skim coat ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic ▫ HVAC system components
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Floor drain ▫ Painted structural columns and beams ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

Building 9 – Classroom and Laboratory

Table 10: Table identifying potentially hazardous materials at Building 9.

Asbestos-containing material (ACM)	▫ 2'x4' acoustic ceiling tiles ▫ Drywall and joint compound ▫ Vinyl base cove and mastic ▫ Carpet mastic ▫ Vinyl floor covering (12" x12" tiles) and associated mastic ▫ Vinyl sheet flooring ▫ Counter top ▫ Mastic under sink ▫ Transite panels ▫ Exterior Window putty ▫ Exterior stucco ▫ Exterior paint/skim coat ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic ▫ HVAC system components
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Floor drain ▫ Painted structural columns and beams ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

Exterior Restrooms

Table 11: Table identifying potentially hazardous materials at the exterior restrooms.

Asbestos-containing material (ACM)	▫ Ceiling system
Lead based paints (LBP)	▫ Painted door and frames ▫ Ceramic tiles ▫ Sinks, Toilet bowls and Urinals
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ None noted
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures)

Buildings 12, 13, 14 | Business Education Complex

Figure 126: North façade of Business Education west wing (Bldg. 13).

Brief Physical Description

The Business Education complex is a collection of three buildings (Bldgs. 12, 13, and 14). The complex is roughly L-shaped with covered walkways connecting the three buildings. A covered breezeway separates Building 12 to the east and Building 13 the west; the covered walkway extends into the breezeway and out south toward Building 14.

Buildings 12 and 13 are single-story, wood-framed and reinforced masonry buildings on caissons. They are similar in size, materials, and construction. The buildings are generally rectangular in plan and share a membrane-covered side-gabled roof that covers the breezeway separating the two buildings. The eaves with tongue and groove wood soffits overhang on both sides of the roof. A metal trellis supported by exposed wood rafters is at the north side of the breezeway and across Building 13's projecting east end. The buildings share a covered walkway along their plan south façades that is supported by reinforced masonry wing walls at Building 12.

Reinforced brick masonry walls are the primary construction material for Buildings 12 and 13. On the south (principal) façade, plywood-clad storage units are attached in a number of locations between classroom doors. A band of near continuous aluminum-framed clerestory windows is located above the covered walkway roofline and partially obscured or infilled by HVAC equipment. On the plan north façades of Buildings 12 and 13 are aluminum-framed windows on a low brick wall interspersed with brick-clad shear walls. The plan east façade of Building 13 is almost entirely glazed with full-height, wood-framed fixed windows. A single wood door is offset at the center. At the base of the glazing are small louvers.

Wood entrance doors are along the south façades of both buildings. All doors have a painted plywood transom above and some have painted plywood paneling to the sides.

Building 14 is a one-story, brick-clad building located south of Building 13 and southwest of where the covered walkways intersect. The building is irregular in plan with a flat roof. Dark aluminum-framed window walls with dark glazing and a deep aluminum fascia are at some façades. At the east façade is a recessed display window with wood-clad walls.

A full architectural description can be found in Part 1C: 'Physical Description.'

Complex Condition Summary

The Business Education complex is in a fair to good condition with minor areas of deterioration. The tables below summarize the exterior architectural condition (Table 12) and the condition of the building systems (Table 13).

Table 12: Table summarizing the exterior architectural conditions at the Business Education complex. [vi]

Exterior Architectural Conditions															
		Walls			Windows			Doors			Roofs				
Material		Brick	Concrete	Wood-Framed	Aluminum-Framed	Wood-Framed	Other	Wood	Steel	Other	Low Slope	Copper Dome	Convex	Exterior Walkway	Miscellaneous
Condition	Bldg.														
	12	G/F[2]			F			F			G			F	
	13	G			F	G		F			F			F	P[4]
	14[1]	G						F			[3]			F	

1. Only the original parts of Building 14 were surveyed.
2. Includes brick wing walls.
3. Not viewed.
4. Wooden awning above breezeway, north façade.

[vi] G = good condition, F = fair condition, P = poor condition (see Table 1 for details).

Table 13: Table summarizing the building systems conditions at the Business Education complex.

	13	G	F[1]	F[4]	F	F/P	F	F	F	✓	✓	✓	✓	✓	G	G	-
	14	G	F[2]	F[3/5/6]	-	F/P	F	F	G	✓	✓	✓	✓	✓	G	G	-

Notes:

1. The clear distance between the reinforced masonry and walkway canopies does not meet the limit, and the maximum unblocked plywood diaphragm horizontal span is greater than the 40 feet limit for Life Safety.
2. Unacceptable steel moment frames, unacceptable drift at moment frames, there are no cross ties between diaphragm chords, unblocked diaphragm span exceeding life safety limit, the south longitudinal direction does not contain any plywood shear walls, no wood structural panel shear walls are present for bracing at the south longitudinal wall, wood shear walls exceed the maximum life safety limits for aspect ratio and shear stress.
3. Inadequate attachment of projector screens in classrooms.
4. Inadequate attachment of contents: 2 server racks, 2 file cabinets in Room 105A, and 1 shelf system in Room 106A are not anchored.
5. Bookshelves in the staff office are unanchored.
6. Light fixtures in Rooms 152 and 153 are not supported independent of the suspended ceiling.
7. Building does not currently have sprinkler system.
8. Hazardous Materials assessment consists of visual survey only. Sampling is required to confirm presence.

Structural Condition Assessment

The following is a summary of the findings from the structural evaluation of Buildings 12 and 13 by Risha Engineering (see Appendix 3: Structural Evaluation for full report). Building 14 was not assessed.

Buildings 12 & 13

Buildings 12 and 13 are one story structures consisting of wood roof rafters with diagonal wood sheathing typically supported by a central steel beam and exterior reinforced masonry walls, wood framed walls or steel posts and wood beams. Reinforced masonry and wood shear walls provide lateral force resistance. Wood shear walls, out-of-plane wall anchorage, and roof ties were added as part of a 1999 seismic retrofit.

The buildings are generally in good condition. The roof diaphragm span is noncompliant. Anchorage of projector screens is typically noncompliant. Several tall narrow contents are unanchored, which is also noncompliant.

Exterior Closure Condition Assessment

Exterior Walls

<u>Brick</u>

The brick walls in the Business Education complex are in good condition with small localized areas of deterioration.

Hairline cracking was only noted on a few isolated bricks on Building 13. On Building 12 two isolated incidents of cracked bricks were noted. A brick at the top southeast corner had a single wide crack through its full height but was still in place. A second brick on the northeast corner was heavily cracked from base to top in several locations with material loss occurring (Figure 102).

Spalls were observed in a small localized area near the base of the east side of the projecting west façade of Building 12. These appeared to be focused at the south side of each brick.

The lowest course of brick on the east façade of Building 12 was chipped along its base (Figure 103).

On the east façade of Building 12 a small proportion of vertical mortar joints were failing near the top of the joint (less than 1% of total on façade). The bond at the brick-mortar interface was poor in limited locations on Building 12 (less than 5% of total).

Heavy efflorescence was present on the north façade of Building 13 above the planter up to the height of the top of the 'no skateboarding' sign (Figure 129). On the projecting west façade of Building 12 efflorescence and algal growth was present on the east side located around a pipe and on the west side below the open awning efflorescence and algal growth affected 40% of the exposed projecting part of the wall (Figure 130).

Figure 127: Chipped brick at the base of the east façade of Building 12.

Figure 128: Heavily cracked brick with material loss at the northeast corner of Building 12.

Figure 129: Heavy efflorescence on the north façade of Building 13.

Figure 130: Efflorescence and algal growth on the west side of the projecting west façade.

Brick Wing-Wall Canopy Supports

The brick wing walls on Building 12 are in fair to poor condition. There is significant efflorescence reaching ½ to ¾ of the way up the height of each wall. Within the areas where efflorescence is present some of the bricks (approx. 5% of total) are spalling or have lost material particularly focused at the edges of the bricks (Figure 131).

Figure 131: Wing wall on Building 12 showing efflorescence up to ¾ of the height of the wall and spalling brickwork particularly at the right-hand side of the image.

Wood-clad Walls

Plywood-Clad Walls

The plywood detailing on the south façades of Buildings 12 and 13 is in fair condition. Water damage is affecting the base of the external storage units of Building 12 resulting in small splits and swelling (Figure 132). Paint on the plywood panels between doors has minor chips at the corners (Figure 133).

Figure 132: Water damage at the base of the plywood external storage units on Building 12.

Figure 133: Chipped paint at the edges of the plywood side panel.

Windows

Aluminum Windows

The aluminum windows at the Business Education complex are in fair condition. All of the aluminum frames and the louvers have a dull patina with a low level of surface pitting. The glazing putty is cracked and deteriorating around all panes (Figure 134).

Fasteners in the mullions of the clerestory windows above the walkway between Buildings 12 and 13 have corroded.

The concrete sills on the north façade of Buildings 12 and 13 are cracked at the joints between units in several locations (approx. 25%) (Figure 135).

Figure 134: Deteriorated glazing putty as seen on the north façade of Building 12.

Figure 135: Crack at join between window sill units.

Wood-Framed Windows

The wood-framed windows on the east façade of Building 13 are in good condition.

Exterior Doors

Wood Doors

The wooden doors are in fair condition with a limited amount of water damage at their bases (approx. 90% of doors) causing the wood to split and swell and paint loss (Figure 136).

Figure 136: Water damage at the base of a wood door on Building 12.

Roofing

Low-Slope Roof

The low-slope roofs at the Business Education complex are in good condition. There is a low level of soiling and algal growth across the membrane cover (Figure 137).

Figure 137: Light soiling and algal growth on the low-slope roof over Building 12.

Covered Walkways

The covered walkways at the Business Education complex are in fair to poor condition.

There was a build-up of plant detritus on the principal walkway roof amongst the pipework and algal growth in areas where water has pooled (Figure 138). Many of the conduits have signs of corrosion.

The gutter for the secondary walkway connecting Building 14 was blocked and full.

The wood soffit was observed to be rotten in several different locations along the principal walkway and additional supports have been implemented to support the walkway at these locations (Figure 139). In addition in some of these locations decay could also be seen in the neighboring wood ceiling.

The concrete paving slab that runs in sections below the covered walkway has a meandering crack running down the center along the length of the walkway and many secondary cracks (Figure 140). These cracks are not observed to pose a hazard at present. Near the east end of Building 13 there is a large patch of iron rust staining on the concrete slab.

Figure 138: Network of pipes on the walkway canopy roof neighboring Building 12 with a build-up of plant detritus.

Figure 139: Rotten wood soffit and ceiling wood finish on the walkway canopy at Building 12.

Figure 140: Crack in the concrete paving slab below the covered walkway at Building 12.

Miscellaneous Features

Trellis between Buildings

The trellis extending from the roofline on the north façade of Building 13 is in poor condition. One rafter is severely rotted at the roofline and a neighboring metal slat has deformed. The neighboring rafter appears to have been cut short because unlike the others it only extends to the edge of the roofline and not out to the edge of the trellis indicating a potential reduction in support for the trellis (Figure 141).

Figure 141: Rotten beam and damaged slat at the roof edge, plus stunted wooden beam in the background.

Interior Condition Assessment

The interiors at Buildings 12 and 13 are in good condition. The interiors at Building 14 were not assessed.

The clerestory windows, where present, are painted or boarded up in all rooms (Figure 142). Original plywood paneling below the windows along the north wall of both Buildings 12 and 13 is in good condition (Figure 143) with one section in the storage room at Building 13 painted. An original full-height built-in plywood cabinet in room 104, Building 12, remains and is in good condition (Figure 144**Error! Reference source not found.**).

Figure 142: Blocked clerestories in Room 107, Building 13.

Figure 143: Plywood paneling with channel below the windows on the north wall in Room 101, Bldg.12.

Figure 144: Plywood inbuilt cupboard in Room 104, Building 12.

Plumbing Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

- The restrooms in this area are in fair condition, the fixtures are starting to show signs of extended use. No major defects or leaks were visible from the fixtures.

Mechanical (heating, ventilating, and air conditioning) Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

Buildings 12 & 13

Buildings 12 and 13 are classroom buildings that are served by a roof top package unit, one per classroom.

- The RTU units for the classrooms are Carrier Gas Electric units which are located above the walkway foyer and have side discharge ductwork within the classroom. The RTUs range from 3 – 5 ton units and are in fair condition. The unit is approximately 50% thru its useful life and should have another 5 to 10 years of service life. The units were manufactured in late 2007.
- The units are tied to an Alerton EMS DDC control system.

Fire and Life Safety Assessment

The following is a summary of the visual examination undertaken by Jensen Hughes of the fire protection systems and life safety features of the facilities at Buildings 12, 13, and 14 (see Appendix 5: 'Fire and Life Safety Evaluation' for full report). No system testing or intrusive inspections were conducted by Jensen Hughes personnel.

Table 14: Business Education complex fire protection/life safety systems- the following table shows the surveyed buildings in the complex (Bldgs. 12-14) identifying the systems currently provided.

Bldg. No.	Building Name	Sprinklered	Fire Alarm	Fire Extinguisher	Fire Hose Reel	Adequate Egress	Comments
12	Business Education	N	Y	Y	Y	Y	-
13	Business Education	N	Y	Y	Y	N	Room 106 does not have adequate egress. See Fire and Life Safety Report for more details.
14	Business Education	N	Y	Y	Y	Y	-

Note: N means the system is not provided for the building. Y means the system is provided for the building.

Table 15: Observations on the fire protection/life safety systems at the Business Education complex (Bldgs. 12-14) made during the 2015 survey.

Item No.	Bldg. No.	Building Name	System	Observation
1	12	Business Education	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building.
2	12	Business Education	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ.
3	13	Business Education	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building.
4	13	Business Education	Fire Alarm	In room 105 a 30cd strobe is installed in the room. A 30cd strobe can cover a room that is 28 x 28 feet in accordance with NFPA 72. The room measures to be 20’8” by 34’2”.
5	13	Business Education	Egress	Room 106 measures to be 1,208 square feet. This room is provided with only one exit. Since this room has an occupant load greater than 49, it is required to have a minimum of two exits.
6	13	Business Education	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ.
7	14	Business Education	Fire Alarm	Manual fire alarm boxes are provided on the outside of the building.
8	14	Business Education	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ.

Electrical Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

Buildings 12 & 13

The electrical system for both buildings 12 and 13 are powered from Building 14 with 400 amps of 120/208 volt, 3*phase, 4*wire power. The electrical system at building 14 is fed from a 5 KV switch providing 4160 volts to two transformers. The first is a 75 KVA transformer that delivers 400 amps of 120/208 volt, 3*phase, 4*wire power. The second is a 225 KVA transformer that provides 600 amps of 120/208 volt, 3*phase, 4*wire power for HVAC equipment in buildings 12, 13, and 14. Most of the panels are aged beyond their rated useful life expectancy.

The lighting for both buildings was recently upgraded to direct/indirect linear T*8 fluorescent pendant lighting using occupancy sensors with an Edward's system. The buildings are not equipped with emergency lighting or illuminated exit signs. These buildings do not have an emergency generator.

Hazardous Materials (HazMat) Assessment

A visual survey was carried out in the Business Education complex by Omega Environmental Services Inc. to identify the potential presence of hazardous materials (see full report in Appendix). Based on the visual observations made during the limited assessment it is Omega's professional opinion that the following potentially hazardous materials may be present in the subject buildings:

Building 12 – Business Education Wing

Table 16: Table identifying potentially hazardous materials at Building 12.

Asbestos-containing material (ACM)	▫ 1'x1' acoustic ceiling tile with associated mastic ▫ 2'x4' acoustic ceiling tile ▫ Drywall and joint compound ▫ Transite panels ▫ Vinyl base cove mastic ▫ Carpet mastic ▫ Vinyl floor tile and associated mastic ▫ Exterior grout ▫ Insulation, registered ▫ Exterior Window putty ▫ Exterior paint/skim coat ▫ Exterior stucco ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic ▫ HVAC system components

Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

Building 13 – Business Education Wing

Table 17: Table identifying potentially hazardous materials at Building 13.

Asbestos-containing material (ACM)	▫ 1’x1’ acoustic ceiling tile with associated mastic ▫ 2’x4’ acoustic ceiling tile ▫ Drywall and joint compound ▫ Transite panels ▫ Vinyl base cove mastic ▫ Carpet mastic ▫ Vinyl floor tile and associated mastic ▫ Exterior grout ▫ Insulation, registered ▫ Exterior Window putty ▫ Exterior paint/skim coat ▫ Exterior stucco ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic ▫ HVAC system components
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

Building 14 – Business Education Wing

Table 18: Table identifying potentially hazardous materials at Building 14.

Asbestos-containing material (ACM)	▫ 1'x1' acoustic ceiling tile with associated mastic ▫ 2'x4' acoustic ceiling tile ▫ Drywall and joint compound ▫ Transite panels ▫ Vinyl base cove mastic ▫ Carpet mastic ▫ Vinyl floor tile and associated mastic ▫ Exterior grout ▫ Insulation, registered ▫ Exterior Window putty ▫ Exterior paint/skim coat ▫ Exterior stucco ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic ▫ HVAC system components
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls

Buildings 2, 4 | Theater and Music Complex

Figure 145: North façade of Robert Moore Theater (Bldg. 2), *center*, and west façade of Ticket office (Bldg. 2b), *left*.

Brief Physical Description

The contributing buildings within the Theater and Music complex are the Robert Moore Theater (Building 2), which has a stand-alone ticket office building (Building 2b), and the original Music Building with later addition (Building 4).

The Theater Building (Bldg. 2) is made up of several connected spaces; a curved-wall auditorium and two rectangular spaces to the south, all with board-formed poured-in place concrete walls. These walls have a textured and painted finish. To the west of these is a low L-shaped brick bearing wall offshoot. To the east is a modern addition with panelized stucco walls. Multiple entrances and exits are present around the building. The only windows are aluminum-framed clerestory windows on the north and south of the brick offshoot, a large shop-front window at the south entrance to the additional performance spaces, and an opaque glass floor-to-ceiling window at the brick offshoot. The roofs are all membrane covered. The auditorium has a distinctive convex roof and behind the parapet wall is a deep copper gutter with internal downspouts that exit into an open concrete gutter at the base of the building. The other roof surfaces also have internal drainage but no gutters.

Covered walkways with membrane-covered roofs, stucco and wood soffits, stuccoed ceilings and poured concrete slab floors run east-west across the north façade of the Theater Building (Bldg. 2) and north-south along the east façade of the Music Building (Bldg. 4) as well as smaller offshoots running from this to the Theater Building (Bldg. 2).

A soffit connects the walkway canopy to the building. Below this, the north façade wall of the auditorium is tongue and groove sheathing matching the pattern of the board-formed concrete and curving with the façade. Within the wood siding are four evenly spaced hidden double-door public entrances to the auditorium.

In front of the auditorium at the northeast corner is a small single-story standalone building that houses the ticket booth, office and restroom (Building. 2b). The low-slope roof building is roughly rectangular in plan and has two wings. The original part of Building 2b is brick and stucco clad and shares the covered walkway with the Auditorium. The ticket booth has a glazed window. An integrated cantilevered concrete bench is below the signage and sculpture. The addition is stucco-clad and is slightly smaller and shorter. The northwest corner of the building is notched with a canopy overhead and two entrance doors.

Building 4 is a rectangular, linear, wood framed and masonry building. The building is primarily one-story, with taller north and south stuccoed ends flanking an off-center brick-clad section that is lower in height and which projects toward the west. There are no window openings. The wood-framed roofs of the taller north and south ends are slightly sloped to the west while the lower brick section has a flat roof with a membrane coating. The building rests on a concrete slab on grade with footings and foundation walls. Door openings with hollow-metal doors lead to individual classrooms along the east façade under the covered walkway. Above the covered walkways is a door to a mechanical room at the north half of the building. There are two exit doors on the west façade.

A full architectural description can be found in Part 1C: 'Physical Description.'

Complex Condition Summary

The Theater and Music complex is in a fair to good condition with minor areas of deterioration. The tables below summarize the exterior architectural condition (Table 19) and the condition of the building systems (Table 20).

Table 19: Table summarizing the exterior architectural conditions at the Theater and Music complex. [vii]

Exterior Architectural Conditions															
		Walls			Windows			Doors			Roofs			Exterior Walkway	Miscellaneous
	Material	Brick	Concrete	Wood-Framed	Aluminum-Framed	Wood-Framed	Other	Wood	Steel	Other	Low Slope	Copper Dome	Convex		
Condition	Bldg.														
	2	F	G	G[1/2]	F			F	F	G[3]	F		G	G	F[4]
	4	F		F						G[3]	F			G	

1. Wood paneling at theater public entrance.
2. Stucco wood-framed walls (non-original).
3. Non-ferrous metal doors (non-original).
4. Peterpaul Ott sculpture attached to Building 2b.

[vii] G = good condition, F = fair condition, P = poor condition (see Table 1 for details).

Table 20: Table summarizing the building systems conditions at the Theater and Music complex.[viii]

Building Systems																	
		Structural			MEP			Fire / Life Safety		Environmental[9/10]					Disabled Access		
		Vertical	Lateral	Non-Structural	Mech.	Elec.	Plumb.	Fire	Life Safety	ACM	Lead Paint	Mercury	HCFC	PCB	Site	Entry Doors	Other
Condition	Bldg.																
	2	G	F[1/2]	F[5/6/7]	F	F	G	G	G	✓	✓	✓	✓	✓	G	G	-
	4	G	F[3/4]	F	G	G	G	G[8]	G	✓	✓	✓	✓	✓	G	G	-

Notes:

1. Stage & auditorium: structural deficiencies related to spacing of reinforcing steel, strength of concrete wall anchorages to diaphragm, lack of cross-ties between diaphragm chords, exceeding the maximum limit for unblocked plywood diaphragm horizontal span, and piles inadequately anchored to pile caps below stage.
2. The interior mezzanine level is not anchored to the lateral force resisting elements of the main structure and does not have independent bracing.
3. Inadequate anchorage of masonry walls to diaphragm, and lateral restraint of integrated suspended ceilings at exits and corridors are not compliant.
4. Stage: Various tall and/or heavy items are unanchored/not braced, and flexible couplings not present at required piping type.
5. Auditorium: Fire suppression piping not braced, inadequate lath and plaster ceiling support, and no independent light fixture support.
6. A sign at the Drama Workshop was not adequately braced.
7. No independent light fixture support, and inadequate stair and smoke duct bracing.
8. Building does not currently have sprinkler system.
9. Hazardous Materials assessment consists of visual survey only. Sampling is required to confirm presence.
10. Tritium gas also potentially present in exit signs in Buildings 2 and 4.

Structural Condition Assessment

The following is a summary of the findings from the structural evaluation of Buildings 2 and 4 by Risha Engineering (see Appendix 3: Structural Evaluation for full report).

Building 2 – Stage and Auditorium, Drama Workshop

Building 2 is a one story structure. It contains an auditorium and stage, both consisting of a wood framed roof supported by steel trusses and concrete bearing walls. The Drama Workshop was added in 1974 and comprises insulating concrete over metal deck diaphragm supported by steel framing and with concrete walls Exterior walkway canopies which connect adjacent buildings are supported by exterior building walls on one side and cantilever columns on the opposite side. A mechanical mezzanine enclosure was added as part of 1992 renovations.

[viii] G = good condition, F = fair condition, P = poor condition (see Table 1 for details), ✓ = present.

The buildings are generally in good condition. The building's close proximity to adjacent unattached structures is noncompliant. Other noncompliant structural items are: inadequate mezzanine bracing; noncompliant concrete shear wall reinforcing; unblocked wood diaphragm spans exceed the maximum limits; concrete wall anchorage to wood diaphragm is inadequate; no cross-ties in the wood roof diaphragm, and; inadequate pile cap anchorage. Non-structural items that are noncompliant are: tall narrow building contents are unanchored; miscellaneous equipment is inadequately braced; inadequate ceiling support at exits or corridors; a sign at the Drama Workshop is inadequately braced; light fixtures in the suspended grid ceilings are not supported independently of the ceiling suspension system, and; fire suppression piping is not braced properly, and flexible couplings are not provided.

Building 4 – Music

Building 4 is a one story structure consisting of a steel framed roof with wood sheathing supported on wood framed and reinforced masonry walls brick walls.

The building is in generally good condition. The masonry wall anchorage to the roof diaphragm is inadequate. Non-structural systems that have noncompliant bracing are the integrated ceiling, the light fixtures in the suspended ceilings, and smoke control ducting.

Exterior Closure Condition Assessment

Exterior Walls

<u>Brick</u>

The brick walls in the Theater and Music complex are generally in fair to good condition, with localized areas of deterioration.

Hairline cracks are present in around 25% of the bricks on Building 4 possibly related to their manufacture. The west wall of Building 4 has an area of original bricks (less than 5% of total on west façade) that have lost material from their edges (Figure 146).

Around five bricks on the end of the projecting brick wall from the west of the Theater Building (Bldg. 2) have lost a small amount of material apparently by impact damage.

The bond at the brick-mortar interface is poor in a few isolated locations on the east façade of the Ticket Office (Bldg. 2b) and east façade of the Music Building (Bldg. 4).

A minor amount of efflorescence was observed neighboring mortar joints on the Theater Building (Bldg. 2) and Ticket Office (Bldg. 2b) covering an area the size of a couple of bricks or less in each case.

A small area of graffiti ghosting (following removal) is just visible on the south façade of the brick offshoot on the west side of Building 2.

A new door opening that has been cut into the west façade of Building 4 has been over cut resulting in extended cutting lines through the brickwork at the upper corners of the door (Figure 147).

Figure 146: West façade of the Music Building showing loss of brick surface (Bldg. 4).

Figure 147: Cutting lines through the brickwork at the location of a new door insertion on the west façade of the Music Building (Bldg. 4).

Concrete

Poured-in-Place

The poured-in-place concrete walls at the Theater Building (Bldg. 2) are generally in good condition with localized areas of damage.

An isolated fine diagonal crack with associated small scale paint and surface texture loss was identified on Building 2. In our experience this type of crack is associated with structural movement. At these locations there is some loss of the textured and painted surface. The textured and painted surface is also starting to deteriorate and peel at the top of the parapet walls in localized areas (Figure 148). A hairline crack is present running up the joint between the two parts of Building 2 composed of straight poured concrete walls. The exposed concrete plinth of the Ticket Office (Bldg. 2b) has a vertical crack on the east façade near a joint line approx. 1/16" wide. In addition there were one or two minor vertical hairline cracks observed in this area.
The exposed end of an internal downspout from the auditorium roof that exits the concrete wall to the south just a few feet below the parapet to allow drainage onto the low-slope roofs below is heavily corroded (Figure 149).

There is widespread lichen growth on the parapet wall head of the theater auditorium (Bldg. 2) (Figure 150).

An area (approx. 4ft x 8ft) of the concrete on the east side of the theater auditorium (Bldg. 2) has a patchy appearance (Figure 151). It appears that in this location there was previously an attachment (such as an awning) which has been removed and the surface has been repaired (Figure 24).

Figure 148: Crack on the west façade of Building 2 with textured finish and paint loss.

Figure 149: Rusted end of downpipe feeding water to flat roof to the south of the auditorium (Bldg. 2).

Figure 150: Widespread lichen growth (yellow) on the auditorium (Bldg. 2) parapet wall.

Figure 151: Patched finish on the east façade of Building 2.

<u>Stucco-Clad Wood-Frame</u>

Wood-framed walls are generally in fair to good condition, several of which are on recent additions. The stucco on Building 4 has two areas of cracking noted. A horizontal crack runs the length of the west façade of the original (north) stuccoed portion of the building at a height of 26" (Figure 152). This crack occurs at the interface between the concrete plinth and the wood framed walls. At the southwest corner of the stucco on the addition there is hairline cracking around the top and bottom corners.

On the recent addition to the east side of Building 2 there is hairline cracking running horizontally across several of the stucco panels.

Alterations to the Music Building (Bldg. 4) fenestration have resulted in a multiple large visible patches on the east and west façades (Figure 153). Cracking was identified at the edges of some patches (approx. 5% of boundary).

Figure 152: Horizontal crack on the west façade of the original (north) portion of the Music Building (Bldg. 2).

Figure 153: Visible patching of stucco on east façade of Music Building (Bldg. 2).

Wood-clad Walls

Plywood-Clad Walls

A plywood accent panel on the Ticket Office (Bldg. 2b) has been painted, obscuring its original natural finish. The lower edge of the plywood has water damage and is visibly swelling and splitting.

Windows

Aluminum Windows

The limited number of windows on the Theater Building (Bldg. 2) are in fair to good condition. The clerestory windows on the brick offshoot on the west side of the building have a low level of surface pitting on the frames giving them a dull patina. The majority of the screws in the mullions are corroded (Figure 154).

The ticket booth on the south façade has minor surface scratches to the frames.

Figure 154: Clerestory windows on the west offshoot from Building 2 with corroded fasteners.

Exterior Doors

The doors at the Theater and Music complex are in good condition.

Roofing

Low-Slope Roof

The low-slope roofs at the Theater and Music complex are in fair condition, the roof of the Ticket Office (Bldg. 2b) was not viewed.

Areas of water pooling were observed on several areas of the roof. Water was visibly pooling where no drainage was present in the following locations:

1. On the low one-story brick offshoot on the west side of the Theater Building (Bldg. 2) beside the straight concrete walls (Figure 155);
2. On the Theater entrance porch at the north side of the building; and
3. Close to the west and north edges of the roof on the Music Building (Bldg. 4).

Water was visibly pooling beside and surrounding internal drains where the low lip surrounding the drain was preventing complete drainage in the following locations:

1. On the small low porch over the Theater (Bldg. 2) fire exit on the west façade;
2. Within the area of the Theater roof with the parapet wall containing mechanical equipment/vents (Figure 156); and
3. On the low one-story brick offshoot on the west side of the Theater Building (Bldg. 2).

In areas of observed water pooling there was an accumulation of soiling and algal growth. There was a low level of plant detritus accumulation on the roofs.

Figure 155: Water pooling on top of the brick offshoot on the west side of Building 2.

Figure 156: Water pooling within the dropped-level area on Building 2.

Other Roofs

Convex Roof

The convex roof at the Theater Building (Bldg. 2) over the auditorium was in fair to good condition.

The membrane had a low level of soiling or algal growth discoloration and there was a low level of accumulation of plant detritus in the deep gutter (Figure 157).

Figure 157: Plant detritus accumulation within the gutter on the theater auditorium (Bldg. 2).

Covered Walkways

The covered walkways in the Theater and Music complex are in fair to good condition.

The east-west walkway running along the north of the complex does not appear to have integrated drainage any longer although scuppers are still present, and pooling was observed in patches on the roof along the length of the walkway. In areas of observed water pooling there was an accumulation of soiling and algal growth.

The north-south walkway and small east-west offshoots are generally in fair condition. There is a small amount of water pooling occurring in patches along the edges of the roof close to the gutters. There is also a small amount of water pooling occurring along the south edge of the southern east-west offshoot where no drainage is present. In areas of observed water pooling there was an accumulation of soiling and algal growth. There was a low level of plant detritus accumulation in the gutters.

The stuccoed sides of the east-west walkway have a low level of soiling.

The ceiling of the north-south walkway which is stuccoed has a hairline crack running down its center running along a significant proportion of the center of the walkway (Figure 158).

The concrete paving slab that runs in sections below the covered walkway is fairly consistently cracked in each slab with a dominant crack through the center of the slab (parallel to the walkway). In addition there tend to be a few secondary cracks running in both directions through the slab. These currently were not observed to pose a hazard (Figure 159).

Figure 158: Cracking in the ceiling of the north-south walkway neighboring Building 4.

Figure 159: Cracking in the paving of the east-west walkway to the north of Building 2.

Interior Condition Assessment

The interiors of the Theater Building (Bldg.2) are in fair condition. The auditorium has recently been refurbished and is in good condition. The Music Building (Bldg. 2) has had a recent refurbishment and is in good condition.

Room 101 at the north end of the Music Building (Bldg.4) is the one room in the building to retain some of its original features. The large wood-paneled back wall that curves to become a wood-paneled ceiling is in fair condition but has some surface wear (Figure 160).

Figure 160: Original wood-paneled back wall and ceiling showing signs of wear in Room 101, Music Building (Bldg. 4).

Plumbing Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

- The restrooms were in good condition, fixtures appear to be replaced within the last 5 years.

- The standing water next to the Multizone unit should be fixed. It appears the roofing material is not slopped correctly to the roof drain which is causing the water to pond up. The standing water could potentially cause damage to the building.

Mechanical (heating, ventilating, and air conditioning) Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

Building 2 – Theater

Building 2 has a mixture of HVAC equipment that serves the building. There is equipment located within a mezzanine that is accessed from the back of the stage and equipment on the roof. The equipment within the mezzanine appears to serve the main Auditorium and is a hydronic heating and cooling system. The mezzanine contains a boiler, hydronic heating pumps and two custom air handlers. The roof has a single multizone AHU, three Carrier DX heat pump units.

- The hydronic hot water boiler is a Lochinvar Copper Fin II, 1,440,000 BTU/H input with a 1 HP Bell & Grossest base mounted pump system circulation pump and two ½ hp boiler circulation pumps. During the time of the inspection, this equipment was not in operation, but the equipment appears to be in fair condition based on visual inspection.
- The custom 4*Pipe air handlers are Temptrol DH35PL 15 HP supply fan and a Temptrol DH17PL 7.5 HP supply fan. Chilled water is feed from a Trane chiller that is located within Building 3 (Music Building). During the time of the inspection, this equipment was not in operation, but the equipment appears to be in fair condition based on visual inspection.
- The multizone unit is a 4*Pipe Carrier 39TH39KA****QH7*B unit that receives its hot water from the boiler within the mezzanine and chilled water from the chiller within Building 3 (Music Building). This unit serves the area behind the stage, most likely the drama room and associated offices. To the south of the unit, the roof is not sloped correctly to the roof drain and there is standing water. Based on visual inspection, this unit has served beyond its useful life. The pipe insulation serving the unit is falling off is some areas, control valves appear to be old and show signs of rust, the ductwork on the roof appears to be in decent shape.
- The workshop room is served via a DX rooftop packaged unit, Carrier 50HJQ009***601. The unit is in fair condition, the coils are beginning to show signs of corrosion. The unit is approximately half way thru its useful life and should have another 5*10 years of service life.
- The costume workshop room is served via a DX rooftop packaged unit, Carrier 50HJQ007***521. The unit is in fair condition, the coils are beginning to show signs of corrosion. The unit is approximately half way thru its useful life and should have another 5*10 years of service life. The ductwork on the roof is in good condition
- The low roof next to the workshop room is served via a DX rooftop packaged unit, Carrier Unit, could not read label, and appears to be a 3 ton unit. The unit is in fair condition.

Building 4 – Music Wing

Building 4 has a new HVAC system that was installed within the past year and is in good condition. The chiller is an air cooled Trane CGAM 080F with two 7.5 HP Taco base mounted end suction pumps. The boiler is a Lochinvar CHN401 with a Taco 1/3 hp circulation pump and 1.5 hp base mounted end suction system pump.

Fire and Life Safety Assessment

The following is a summary of the visual examination undertaken by Jensen Hughes of the fire protection systems and life safety features of the facilities at Buildings 2 and 4 (see Appendix 5: 'Fire and Life Safety Evaluation' for full report). No system testing or intrusive inspections were conducted by Jensen Hughes personnel.

Table 21: Theater and Music complex fire protection/life safety systems- the following table shows the surveyed buildings in the complex (Bldgs. 2 & 4) identifying the systems currently provided.

Bldg No.	Building Name	Sprinklered	Fire Alarm	Fire Extinguisher	Fire Hose Reel	Adequate Egress	Comments
2	Theater	Y	Y	Y	Y	Y	-
4	Music	N	Y	Y	Y	Y	-

Note: N means the system is not provided for the building. Y means the system is provided for the building.

Table 22: Observations on the fire protection/life safety systems at the Theater and Music complex (Bldgs. 2 & 4) made during the 2015 survey.

Item No.	Bldg. No.	Building Name	System	Observation
1	2	Auditorium	Fire Sprinkler	No seismic bracing is provided on the fire sprinkler riser.
2	2	Auditorium	Fire Sprinkler	It appeared that the seismic bracing for the sprinkler system is not adequate for the system.
3	2	Auditorium	Fire Sprinkler	The spare fire sprinkler cabinet could not be located in the building.
4	2	Auditorium	Fire Sprinkler	The power/storage room (102G) on the right side of the stage does not have adequate fire sprinkler coverage.
5	2	Auditorium	Fire Sprinkler	The status (open/closed) of the Post Indicating Valve (PIV) located near Building 2 is hard to read.
6	2	Auditorium	Fire Sprinkler	The Fire Department Connection (FDC) is not labeled for what buildings it serves.
7	2	Auditorium	Fire Sprinkler	The FDC looks like it is bolted shut and wrench of the appropriate size would have to be used to unbolt the covers for fire department hookup.

8	2	Auditorium	Fire Sprinkler	Storage in the fire sprinkler riser room is too close to the ceiling. The items being stored are closer to the sprinklers than the minimum clearance of 18 inches required by NFPA 13. This will have an effect on the spray pattern of the sprinklers in that room.
9	2	Auditorium	Fire Sprinkler	Fire sprinklers are missing escutcheons on the side exits.
10	2	Auditorium	Egress	Exit signs in the Drama Rooms are not illuminated.
11	2	Auditorium	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ.
12	4	Music	Fire Hose Reels	The fire hose reels are not required for this building, and should be removed with permission of the AHJ.

Electrical Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

The electrical system for building 2, 3 and 4 are derived from a 4160V feed with the switchgear and 4160V transformers located in an electrical yard and electrical equipment room between buildings 2 and 4. The switchgear and transformers for building 4 were recently installed and are in good working condition. The switchgear MS1 and MS2 feeding building 2 are older but appear to be in good working condition. The lighting in building 2 is working condition, however, the older incandescent lighting could be replaced with more efficient fluorescent or LED lighting. There are some older subpanels in building 2 that should be replaced. Equipment of this age is subject to reliability issues and may also present obsolescence issues for obtaining replacement parts. Continued use of this equipment is likely to result in issues with reliability resulting from age related failures. Building 4 was recently remodeled in 2012 and all electrical equipment and lighting was found to be in good condition.

Building 2 – Theater

The electrical system is fed from two 4160 volt transformers, T24 and T24A, located in an electrical yard east of the auditorium. The first transformer T24 is a 500 KVA transformer that delivers 800 amps of 277/480 volt, 3 phase 4 wire power to switchboard ‘MS1’. The second transformer T24A is a 300 KVA transformer that provides 1200 amps of 120/208 volt, 3*phase, 4* wire power to switchboard ‘MS2’. The transformers and switchboards appear to be in good working condition. There are several subpanels throughout the building which appear to be original to the building and are recommended to be replaced. There are multiple subpanels that are not labeled. Cabling has been abandoned in place and left in some of the older boxes. Several boxes have had covers removed and have not been replaced.

General lighting consists of primarily T*8 strip fluorescents in support rooms and incandescent downlights in the dressing rooms. The theater lighting system consists of incandescent lighting controlled by a theatrical dimming system consisting of 600 amp, 240 volt Power Control Systems dimmer racks. The building is equipped with a central battery emergency lighting system that provides emergency egress lighting and also serves illuminated exit signs. Low and high level exit signs are installed throughout and are in good working condition.

Building 4 – Music Wing

Building 4 was recently remodeled in 2012. The electrical system feed starts at a newly installed 4160 volt transformer TVHM, located in an exterior electrical yard between building 2 and 4. The transformer TVHM is a 1000 KVA and delivers 1200 amps of 277/480 volt, 3 phase 4 wire power to switchboard 'STH'. From there, an 800A 480V feed is routed to distribution switchboard 'DSMH' located in Building 3 electrical room, which feeds an 800A 20/208 volt, 3*phase, 4*wire switchboard 'DSML' through a 225kVA transformer. These switchboards feed panels H1, L1A, L1B and L1C all located in the Building 4 electrical room. The transformers, switchboards and panelboards have been recently installed and are in good working condition.

General lighting primarily consists of T*8 recessed fluorescent 2x4 and 4' linear. Select fixtures are provided with battery packs to supply emergency egress lighting. Exit signs with integral backup battery packs are installed throughout and are in good working condition. All rooms have occupancy sensor lighting controls.

It should be noted that any demolition should consider the interconnection of the electrical distribution systems between buildings 2, 3 and 4. At a minimum, both electrical yards between buildings 2 and 4 would need to be protected in place as they are the central power supply for all 3 buildings.

Hazardous Materials (HazMat) Assessment

A visual survey was carried out in the Theater and Music complex by Omega Environmental Services Inc. to identify the potential presence of hazardous materials (full report in Appendix). Based on the visual observations made during the limited assessment it is Omega's professional opinion that the following potentially hazardous materials may be present in the subject buildings:

Building 2 – Robert B. Moore Theater

Table 23: Table identifying potentially hazardous materials at Building 2.

Asbestos-containing material (ACM)	▫ Painted ceiling materials ▫ Drywall and joint compound ▫ Vinyl base cove and mastic ▫ Carpet mastic ▫ Exterior and interior stucco materials ▫ Exterior paint/skim coat ▫ Concrete ▫ Plaster ▫ Stage curtains

	▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Expansion joint ▫ Roofing material ▫ Roof mastic ▫ Insulation ▫ HVAC system components ▫ Pipe insulation ▫ Transite pipe
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Painted structural columns and beams ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ Exit sign
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Transformers ▫ Expansion joint

Building 4 – Music Wing

Table 24: Table identifying potentially hazardous materials at Building 4.

Asbestos-containing material (ACM)	▫ 2'x4' acoustic ceiling tile ▫ 2'x2' acoustic ceiling tile ▫ Drywall and joint compound ▫ Carpet glue ▫ Vinyl base cove and mastic ▫ Sheet vinyl flooring ▫ Vinyl floor covering (12" x12" tiles) and assoc. mastic ▫ Exterior stucco ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic ▫ HVAC system components
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Painted structural columns and beams ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls ▫ Ceramic tiles
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system

Tritium gas	▫ Exit sign
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking

Mechanical Room

Table 25: Table identifying potentially hazardous materials at the mechanical room in Building 4.

Asbestos-containing material (ACM)	▫ Plaster materials ▫ Pipe insulation ▫ Mastic
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ None noted
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures)

Buildings 35, 36, 37, 38, 39 | Math and Planetarium Complex

Figure 161: East façades of Building 35, *left*, and 37, *left background*, looking west.

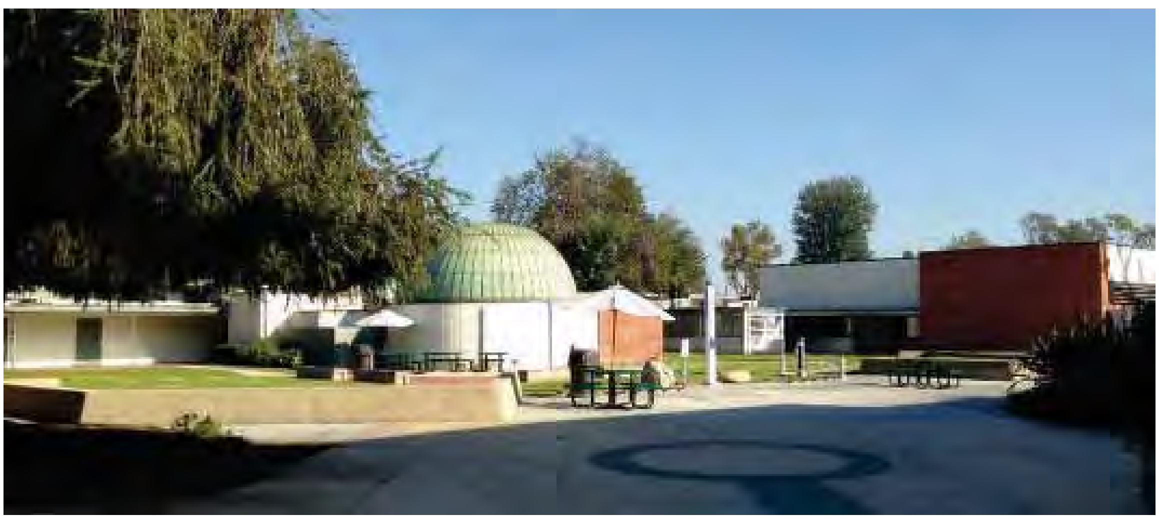

Figure 162: South façades of Buildings 36, *left*, 39, *center*, 38, *right of center*, and 37, *right*, looking north.

Brief Physical Description

The Math and Planetarium complex is a collection of five buildings connected by covered walkways, with Buildings 35 and 36 on the north side and Building 37, 38, and 39 on the south side. A covered breezeway separates Building 35 to the east and Building 36 the west; the covered walkway extends into the breezeway and out south toward Building 37. The complex is on the diagonal orientation intended for the classroom buildings.[ix] All buildings in the complex are single-story.

Buildings 35 and 36 have predominantly stucco covered wood-framed walls with low brick walls on the north façade below aluminum-framed window walls. On the south façade of these buildings, above the canopy, are aluminum-framed clerestory windows and jalousie windows. The entrances are all wood doors on the south façade below the walkway canopy. Painted plywood detailing is present between closely neighboring doors. A low offshoot at the east of Building 35 has vinyl windows and is largely clad in plywood with a stucco panel below the windows. There is one entrance door. These two buildings have a continuous low-slope membrane-covered gabled roof forming a breezeway between the two buildings.

Building 37 is a tall one-story, reinforced masonry and wood-framed building on caissons. It is roughly square in plan structure and clad primarily in brick, stucco and painted plywood. The building has a flat roof with parapet wall, accessible as an observation deck from exterior stairs on the east façade. Windows on the east and west façades are wood-frames and surrounded by plywood clad walls. On the south façade is a high aluminum framed clerestory window with aluminum louvers. On the north façade is an aluminum ventilation louver for the mechanical room. There are wood entrance doors on the north, east and west façades and a roll up metal door on the south façade. The roof and inner parapet walls have a membrane coating. Short covered walkways run north-south connecting to the east-west walkway to the north.

Building 38 is a small one-story, rectangular plan building with a flat roof. It is across covered walkways from the south façade of Building 36 and the west façade of Building 37. The building has stucco finished walls with three wood doors on the east façade leading into individual offices. The west façade has six aluminum-framed sliding windows above a stucco wall. Its north and south facades are stucco with no openings.

The Planetarium building (Bldg. 39) is irregular in plan and composed of two main wings: a round concrete section that is a planetarium/classroom, and a series of one-story rectangular volumes that surround the domed section on the north and east with a courtyard at the center. The Planetarium circular wing has board-formed poured concrete walls with a ribbed texture. The roof is a concrete dome clad in copper panels set back from the surrounding walls, surrounded by a low-slope membrane covered roof. There are no external entrances or fenestration on this part of the building.

The one-story section of Building 39 is comprised of several additions with flat membrane-covered roofs. Only two sections are attached to the domed planetarium. To the north is a narrow, rectangular wing that is part of the original construction. It is brick clad on the west and north (at the covered walkway) and stucco at the east façade facing an interior courtyard. The only opening is on the painted brick north façade with a projecting door that is the main entrance into the planetarium classroom from the covered walkway.

[ix] As per the original plans for the diagonally oriented buildings, this report considers the northeast-facing façade as plan north or north.

Attached to the east of the planetarium is a mostly square wing clad in red brick on its east and south façades. Its west façade in the interior courtyard is stucco. The only opening is a door on the east façade as a secondary entry for the planetarium/ classroom. Connecting the attached north and east wings is an L-shaped wing that creates a small internal courtyard. This wing has a low-slope roof with membrane cover. The walls are mainly stucco finished wood-frame walls with a brick bearing wall on the east façade. There are two entrance doors on the north façade below the covered walkway. Within the courtyard there are two doors, a wood door on the north side and a metal roll-up door on the east side.

A full architectural description can be found in Part 1C: 'Physical Description.'

Complex Condition Summary

The Math and Planetarium complex is generally in a fair condition with minor areas of deterioration. The key area of concern is the sagging walkway canopy roofs which are causing significant levels of water pooling. The tables below summarize the exterior architectural condition (Table 26) and the condition of the building systems (Table 27).

Table 26. Table summarizing the exterior architectural conditions at the Math and Planetarium complex.[x]

Exterior Architectural Conditions														
	Walls			Windows			Doors			Roofs				
Material	Brick	Concrete	Wood-Framed	Aluminum-Framed	Wood-Framed	Other	Wood	Steel	Other	Low Slope	Copper Dome	Convex	Exterior Walkway	Miscellaneous
Condition — Bldg.														
35	G[1]		F	F		F[4/5]	F			F			F	G[8]
36	G		F	F		F[5]	F			F			F	
37	F		F	F	G	F[6/7]	F			F			F	G[9]
38			G	F			F			F				
39	F	G	F[2]	G[3]			F			F	G			

1. Includes brick wing walls.
2. Wood framed 1990s additions.
3. Anodized aluminum windows (1990s).
4. Vinyl replacement windows.
5. Jalousie windows between clerestory windows on south façade above walkway canopy.
6. Louvers over clerestory window on south façade.
7. Louvers for ventilation on mechanical room, north façade.
8. Sculpture at east end of complex.
9. Concrete stair to roof.

[x] G = good condition, F = fair condition, P = poor condition (see Table 1 for details).

Table 27. Table summarizing the building systems conditions at the Math and Planetarium complex.

Building Systems																	
		Structural			MEP			Fire / Life Safety[11]		Environmental[12]					Disabled Access		
		Vertical	Lateral	Non-Structural	Mech.	Elec.	Plumb.	Fire	Life Safety	ACM	Lead Paint	Mercury	HCFC	PCB	Site	Entry Doors	Other
Condition	Bldg.

	36	G	F[2]	F[7]	F	F	F	G	F	✓	✓	✓	✓	✓	G	G	-
	37	G	F[3]	F[8]	P	F	F	G	G	✓	✓	✓	✓	✓	G	G	-
	38	G	G[4]	F[9]	F	F	F	G	G	✓	✓	✓	✓	✓	G	G	-
	39	G	F[5]	F[10]	P	P	F	G	G	✓	✓	✓	✓	✓	G	G	-

Notes:

1. Unacceptable steel moment frames, unacceptable drift at moment frames, there are no cross ties between diaphragm chords, the maximum unblocked plywood diaphragm horizontal span is greater than the limit for Life Safety, the south longitudinal direction does not contain any plywood shear walls, no wood structural panel shear walls are present for bracing at the south longitudinal wall, wood shear walls have an aspect ratio and shear stress over the maximum limits for Life Safety.
2. Unacceptable steel moment frames, unacceptable drift at moment frames, there are no cross ties between diaphragm chords, and the maximum unblocked plywood diaphragm horizontal span is greater than the limit for Life Safety.
3. Collectors at the roof level to at least 1 reinforced masonry shear wall do not appear to be detailed on the available structural drawings and could not be viewed, wood typically in good condition apart from 1 exterior location of wood damage was viewed at a low roof door jamb and 1 joist at the NW corner was viewed to be torqued with slight splitting observed, it is unlikely that existing wall ties or straps have adequate strength or stiffness to resist the out-of-plane connection force calculated in the standard (not viewed), and the low roof unblocked plywood diaphragms appears to have a horizontal span of greater than the Life Safety maximum.
4. The longitudinal direction only contains 1 line of plywood shear walls and the north exterior wall has no lateral system from the roof diaphragm to the foundation, and the north wall has windows along entire length, and no wood structural panel shear walls are present for bracing.
5. Wall anchorages of masonry walls to diaphragm do not have the adequate strength or stiffness to resist the out-of-plane connection force calculated in the standard, and continuous cross-ties between diaphragm chords are inadequate at areas of reinforced masonry walls.
6. Bookshelves in the staff office are unanchored, screen projectors in some classrooms are not adequately braced, and light fixtures in Rooms 152 and 153 are not supported independent of the suspended ceiling.
7. Screen projectors in some classrooms are not adequately braced.
8. 2-3 filing cabinets are not anchored to the floor slab or wall, mechanical equipment on the roof is not anchored to the roof structure, and in the equipment room located at the low roof, and at least 1 boiler is not anchored.
9. At least 1 bookshelf over 4 feet in height is not anchored to the floor or wall and mechanical equipment on the roof is not anchored to the roof structure.
10. Unanchored row of tall lockers in a storage area.
11. Building does not currently have sprinkler system.
12. Hazardous Materials assessment consists of visual survey only. Sampling required to confirm presence.

Structural Condition Assessment

The following is a summary of the findings from the structural evaluation of Buildings 35 through 39 by Risha Engineering (see Appendix 3: Structural Evaluation for full report).

Buildings 35 & 36 – East and West Math Wings

Buildings 35 and 36 are one story mostly wood framed structures connected by walkway canopies. The wood roof rafters with plywood sheathing are supported by a central steel beam and exterior wood walls or headers, or beams with steel posts. The lateral system is plywood shear walls and steel moment frames. There is no evident lateral system along the south exterior wall of Building 35.

The buildings are generally in good condition. The roof diaphragm span, steel moment frames, lack of roof diaphragm cross ties and locations of narrow wood shear walls are all noncompliant. The south exterior wall in Building 35 has no lateral force resisting system, which is noncompliant. The anchorage of some screen projectors is noncompliant. Several tall bookshelves are unanchored, which is also noncompliant. Some light fixtures are not supported independently of the suspended ceiling, which is noncompliant.

Building 37 – Reprographics

Building 37 is a one story structure consisting of wood rafters with plywood sheathing supported by wood framed and reinforced masonry walls, which are also used as the lateral force resisting system.

The building is generally in good condition, with a few areas of minor to moderate deterioration. No collectors at shear walls are present, which is noncompliant. Reinforced masonry wall anchors are not compliant. Mechanical equipment on the roof is not anchored, and vibration isolators on the roof are not equipped with restraints or snubbers, both of which are noncompliant. Filing cabinets are unanchored, which is also noncompliant.

Building 38 - Small Office Addition

The Office Addition is a 1 story wood framed building, approximately 10 feet high, and 13 feet wide by 32 feet long, with roof rafters and plywood sheathing supported by wood framed walls and shear walls.

The building is generally in good condition. The north wall has no lateral force resisting system, which is noncompliant. Mechanical equipment on the roof is not anchored, which is noncompliant. One tall bookshelf is unanchored, which is also noncompliant.

Building 39 – Planetarium

The Planetarium Building is one story structure consisting of 5 areas: 1) a 24 foot diameter reinforced concrete dome with reinforced concrete shear walls; 2) a 12 feet wide by 48 feet long reinforced masonry room adjoining the dome to the north; 3) two new additions consisting of wood frame construction, and; 4) third new addition consisting of reinforced masonry construction.

The building is generally in good condition. The reinforced masonry building directly abuts the concrete dome structure, which is noncompliant. The reinforced masonry wall anchorage to the roof diaphragm is noncompliant, as is the lack of cross ties in the roof diaphragm located at the reinforced masonry walls. A row of tall lockers is unanchored, which is noncompliant.

Exterior Closure Condition Assessment

Exterior Walls

<u>Brick</u>

The brick walls at the Math and Planetarium complex are generally in fair to good condition, with no major signs of distress.

Hairline cracks are present in a handful of individual bricks between the original construction and later addition at the north wall of Building 36. In addition there are a couple of locations where vertical hairline cracks run the full height of the wall below the window walls, cutting through the bricks, and in some places run along the vertical brick-mortar interface (Figure 163). Cracks running through the brick rather than the mortar joints indicate that the mortar is too ‘hard’ for the bricks. Mortar joints are in fair condition, with isolated areas of soft and deteriorated mortar (less than 5% of total mortar joints).

There are small areas of brick masonry at the east wall and southeast corner of Building 37 that have minor surface spalls and associated efflorescence (Figure 164). These bricks are less than 5% of the wall surface.

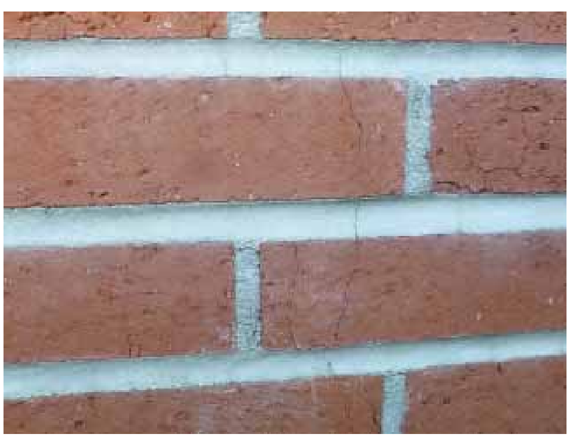

Figure 163: Hairline cracks on north façade of Building 36 on individual brick and running vertically up the wall through the bricks and mortar.

Figure 164: Spalling brickwork and efflorescence on east façade of Building 37.

Brick Wing-Wall Canopy Supports

The brick wing walls supporting the walkway canopy at Building 35 are in fair condition. In one location a fastener connecting the brick wing wall to the canopy has corroded causing rust jacking and the loss of a section of the brickwork on the wall (Figure 165). On the brick wing walls approximately 5% of the brick is spalling, resulting in loss of portions of its outer surface (Figure 166). A low level of efflorescence is also present in these locations.

Figure 165: Oxide jacking causing the loss of brickwork on a brick wing wall at Building 35.

Figure 166: Spalling brickwork on a wing wall at Building 35.

Concrete

Poured-in-Place

The poured-in-place concrete wall at the Planetarium is in good condition with no visible signs of distress. The concrete has a paint finish that is in fair condition with some minor staining at the intersection with the metal drip edge.

Stucco-Clad Wood-Frame

The stucco-clad wood frame walls are generally in fair condition. The stucco is coated with multiple layers of paint, the paint coating is generally in fair condition. There are isolated spots of peeling paint at the base of walls, especially at stucco walls not protected by the exterior canopy (Figure 167).

Stucco walls above the canopy roofs at the south walls of Buildings 35 and 36 are heavily soiled. A new flashing is required between the canopy roof and stucco walls for the entire length of the canopy.

Alterations to Building 36 doorways on the south façade have resulted in visible stucco patching around their perimeters (Figure 168).

Figure 167: West façade of Building 36 with a low level of soiling and paint deterioration at base.

Figure 168: Stucco patching around doorway on Building 36.

Wood-clad Walls

Plywood-Clad Walls

Plywood accent panels at Buildings 35, 36 and 37 have been painted, obscuring their original natural finish. Bottom edges of the plywood are delaminated from exposure to moisture at the east end of Building 35 (Figure 169) and exposed edges at Reprographics (Bldg. 37) (Figure 170). The base of the walls on the west façade of Building 38 are heavily soiled.

Figure 169: Water damage at base of plywood wall on east façade of Building 35.

Figure 170: Water damage at edge of plywood paneling on Building 37 west façade.

Windows

Aluminum Windows

Window walls

The original aluminum window walls at the north elevation of Buildings 35 and 36 are in fair condition with routine maintenance and repair required for the entire window system. The aluminum window frames are soiled and show minor “pitting”. The glazing putty is severely cracked in all locations. Rust staining appears at isolated locations where the window walls meet the concrete sill (Figure 171). The possible source of corrosion is either exposure of the interior steel columns or steel screws to moisture.

The concrete sill at the base of the window walls is in good to fair condition, with minor hairline cracks at approximately 20% of the concrete sills. These cracks do not appear recent and are possibly from shrinkage during the manufacturing process. A corner of the concrete has been lost from the sill at the northwest corner of Building 36.

Figure 171: Rust staining at the window sill on the north façade of Building 36.

Clerestory Windows

Clerestory windows on the south façades of Buildings 35 and 36 are in fair condition. Some window bays, approximately two per classroom space, have been modified to incorporate mechanical ductwork and air grilles. Typical modifications include removal of the individual glass panels at selected louvered window panels to incorporate the addition of ducts and grilles (Figure 172). All remaining glazing has been painted. Exterior horizontal light control louvers that originally covered the entire south elevation above the lower roof canopy have been removed. The aluminum window frames are soiled and show minor "pitting" (Figure 173).

Figure 172: Mechanical equipment on the walkway canopy roof connected to the interior through modified clerestory windows on Building 36.

Figure 173: Blocked clerestory window on Building 36.

Wood Windows

The wood windows at Building 37 are generally in fair condition with no obvious signs of deterioration or decay. The clerestory windows at the south wall, west corner, have been boarded up from the inside.

Windows (Other)

Vinyl replacement windows on the east wall of Building 35 appear to be in good condition.

Exterior Doors

Wood Doors

The wooden doors are in fair to good condition. Minor issues are present such as the paint blistering and a small amount of paint chipped from the base of individual doors. The door on the east façade of Building 35 and the doors on the east façade of Building 37 have water damage at their bases with the wood splitting and swelling and minor paint loss (Figure 174).

The door on the east façade of the Planetarium (Bldg. 39) has ink/paint graffiti and the paint on the transom above is peeling (Figure 175).

Evidence of wood-boring insect (probably termite) damage was present in a door to the mechanical room at the north of Building 37.

Figure 174: Water damage at the base of the door on the east façade of Building 35.

Figure 175: Graffiti and peeling paint from the transom on the east façade of Building 39.

Roofing

Low-Slope Roof

The low-slope roofs at the Math and Planetarium complex are in fair condition.

There is an accumulation of plant detritus on the parapet roof of Building 37 (Figure 176).

Several areas of water pooling were present during the survey on the roofs of buildings 37, 38 and 39 (Figure 177). One notable area of water pooling was on the northeast side of the domed Planetarium Building (Bldg. 39) where significant water was seen to pool on the flat roof between the dome and the neighboring slightly raised offshoots (Figure 178).

All roof surfaces have a low level of soiling and algal growth, plus heavy algal growth on the parapet walls (Figure 176).

Pipes running across the low roofs have surface corrosion (Figure 177).

Figure 176: Soiling and heavy algal growth on the parapet walls of Building 37 plus accumulation of plant detritus.

Figure 177: Water pooling and corroded pipes running across the roofs of Building 37 (right), 38 (center), and the walkway canopy neighboring Building 36 (left).

Other Roofs

Copper Dome

The copper dome on the Planetarium (Bldg. 39) is in fair to good condition. Rust staining is visible below the copper flashing around the perimeter of the copper dome indicating that there is a corroded material below, possibly rebar within the concrete dome below the copper (Figure 179). The rust staining is more visible in the area where water was seen to pool.

Figure 178: Water accumulation on the east side of the Planetarium (Bldg. 39) flat roof surrounding the copper dome.

Figure 179: Corrosion visible below the copper flashing on the Planetarium (Bldg.39).

Covered Walkways

The covered walkways are in fair to poor condition at the Math and Planetarium complex.

A significant amount of plant detritus has built up on the roof of the principal walkway along the south façades of Buildings 35 and 36. There is also deep water pooling on this walkway up to 2" deep in some locations (Figure 180).

On the west side of Building 37 a small area of the ceiling has had a small area of paint peeled or scraped off (Figure 181).

The concrete paving slab that runs in sections below the covered walkway has multiple meandering cracks running along its length and across the slabs. These cracks are not observed to pose a hazard. On the west side of Building 37 there are patches of iron rust staining on the concrete slab (Figure 182).

Figure 180: Accumulation of plant detritus and deep water pooling on the canopy roof of the walkway neighboring Building 36.

Figure 181: Scratched or peeled paintwork on the canopy roof at the west side of Building 37.

Figure 182: Cracking and oxide staining on the concrete paving slabs on the west side of Building 37.

Miscellaneous Features

External stairs

The external stairs on the east façade of Building 37 are in good condition. An accumulation of plant detritus is present on the stairs above the gate potentially increasing water residence times (Figure 183).

Figure 183: Plant detritus on the external stairs of Building 37 above the gate.

Interior Condition Assessment

The interiors of the buildings at the Math and Planetarium complex are in fair general condition with certain areas in poor condition.

The most significant issue in this complex is water staining of ceiling tile which was identified in all buildings. This was commonly in multiple small isolated areas affecting up to four tiles in each area (Figure 184). The water staining was associated with warping of the tile in one of the Building 36 classrooms. In another location the tile was observed to be warping or detaching but there was no associated visible water damage (Figure 185).

In the mechanical room of Building 37 there were large holes broken into the south wall (Figure 186).

A piece of equipment has been removed from the Planetarium leaving a patch of missing carpet and exposing the previous paint scheme behind. The exposed pegboard has multiple large holes from previous conduits and impact damage (Figure 187).

The carpet in the Reprographics Building (Bldg. 37) and Planetarium (Bldg. 39) are in poor condition being old, worn, stained and poorly attached with tape patching certain areas.

The exposed brickwork in the hallway to the north of the planetarium has significant efflorescence in multiple locations associated with apparent water ingress from the roof (Figure 188).

The painted concrete window sills in Buildings 35 and 36 have several cracks, the majority of which were located at the position of the steel mullion above (Figure 189). A vertical narrow crack runs through the tile above the sinks in the men's restroom at Building 37 through seven tiles.

The clerestory windows in all rooms of Buildings 35 and 36 have been painted or blocked.

The paintwork in the hallway to the east of the planetarium is scratched and marked.

Original plywood paneling, cabinetry and wood doors were present in Buildings 35, 37, and 39. These were all in fair condition with some surface marks and soiling (Figure 190 and Figure 191).

Figure 184: Water damage classroom 1, Building 37.

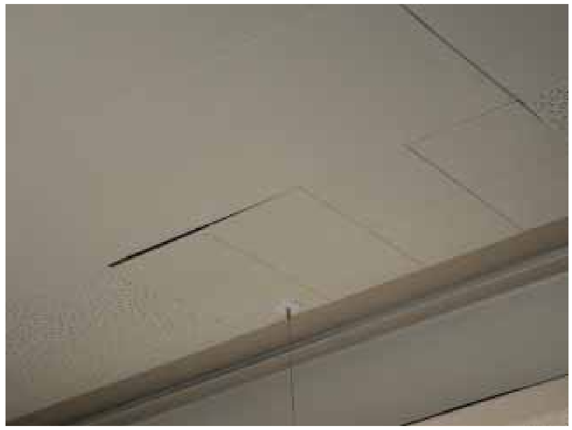

Figure 185: Detaching ceiling tile with no visible water damage at Building 36.

Figure 186: Large holes broken into the south wall of the mechanical room at Building 37.

Figure 187: Removal of equipment has left areas of the flooring and pegboard wall finish lacking current paint finish and carpet.

Figure 188: Efflorescence on internal unpainted brickwork in plan north hallway at Building 39.

Figure 189: Cracking at steel mullions on internal painted concrete sill, Building 35.

Figure 190: Original plywood paneling and cabinetry in room 150, Building 35.

Figure 191: Wear and tear to original wood door in classroom, Building 35.

Plumbing Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

- There is standing water above the foyer next to the HVAC equipment. Additional roof drains should be added to mitigate the standing water. The standing water creates a hazard for the maintenance staff as well as damages the building.

Mechanical (heating, ventilating, and air conditioning) Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

Buildings 35 & 36

Buildings 35 and 36 are classroom buildings that are served by a roof top package unit, one per classroom.

- The RTU units for the classrooms are Carrier Gas Electric units located above the walkway foyer and are side discharge ductwork within the classroom. The RTUs range from 2 – 6 ton units and are in Fair condition. The unit is approximately half way thru its useful life and should have another 5*10 years of service life. The units were manufactured in late 2007.
- Exterior Ductwork is damaged on some of the units due to people walking on the ductwork.
- The units are tied to an Alerton EMS DDC control system.

Building 37 – Reprographics

Building 37 has roof top package units located in various locations for the building. There are units located on the foyer of the building along with units that are located on the high roof within a parapet.

- Above the foyer near building 37 around the HVAC units, there is standing water due to very poor roof drainage.
- Building 37 has roof mounted exhaust fans for the classrooms labs. The fans appear to be in fair condition.
- The units on the low roof are Carrier Gas Electric units with side discharge ductwork within the classroom. The RTUs range from 2 – 6 ton units and are in Fair condition. The unit is approximately half way thru its useful life and should have another 5*10 years of service life. The units were manufactured in late 2007.
- The units located on the high roof Gas Electric units that range from 2*5 ton units and are in old condition. The units have exceeded the useful life expectancy for this equipment and should be changed out.

Building 38 – Science Office Annex

Building 38 has three ductless split systems consist of a wall mounted fan coil located within each office and a condensing unit located on the roof. The systems appear to be in fair condition and are about half way thru the life expectancy of the equipment.

Building 39 – Planetarium

Building 39 has a single rooftop gas unit (RTU) that is old and exceeded its useful life. This unit should be replaced or removed with the building.

Fire and Life Safety Assessment

The following is a summary of the visual examination undertaken by Jensen Hughes of the fire protection systems and life safety features of the facilities at Buildings 35, 36, 37, and 39 (see Appendix 5: ‘Fire and Life Safety Evaluation’ for full report). No system testing or intrusive inspections were conducted by Jensen Hughes personnel.

Table 28: Math and Planetarium complex fire protection/life safety systems- the following table shows the surveyed buildings in the complex (Bldgs. 35, 36, 37, and 39) identifying the systems currently provided.

Bldg. No.	Building Name	Sprinklered	Fire Alarm	Fire Extinguisher	Fire Hose Reel	Adequate Egress	Comments
35	Math	N	Y	Y	Y	N	Room 149 does not have adequate egress. See Fire and Life Safety Report for more details.
36	Math	N	Y	Y	Y	N	Rooms 141, 142, 143, 145, 146, and 148 do not have adequate egress. Only Room 142A is provided with fire sprinklers, which are fed from the domestic water supply.
37	Reprogra-phics	N	Y	Y	Y	Y	-
39	Science	N	Y	Y	Y	Y	-

Note: N means the system is not provided for the building. Y means the system is provided for the building.

Table 29: Observations on the fire protection/life safety systems at the Math and Planetarium complex (Bldgs. 35, 36, 37 & 39) made during the 2015 survey.

Item No.	Bldg. No.	Building Name	System	Observation
1	35	Math Wing	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building.

2	35	Math Wing	Egress	Room 149 is 997 sq. ft. in size. Using an occupant factor of 20 sq. ft. Room 149 is 997 sq. ft. in size and is provided with one exit. Using an occupant factor of 20 sq. ft. per person for classrooms, the occupant load for the room will exceed 49, thereby requiring a second exit.
3	35	Math Wing	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ.
4	36	Math Wing	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building.
5	36	Math Wing	Egress	A brick wall keeps the 2nd exit door from opening all the way.
6	36	Math Wing	Egress	Rooms 141, 142, 143, 145, 146, and 148 all are over 980 sq. ft. Using an occupant load factor of 20 sq. ft. (CBC Table 1004.1.2) all of the rooms exceed the 49 persons for a single exit and a second exit will have to be added to each room.
7	36	Math Wing	Fire Sprinkler	Fire sprinklers are not required in Building 36. The fire sprinklers in Room 142A should be removed, or full fire sprinkler protection should be installed throughout Building 36.
8	36	Math Wing	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ.
9	37	Reprographics	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building.
10	37	Reprographics	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ.
11	39	Science (Planetarium)	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building.

Electrical Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

The electrical system for buildings 35*39 are all powered from Building 37. The main transformer and distribution appear to be in good working condition, however, a majority of the electrical distribution equipment downstream is aged and beyond its useful life expectancy. Lighting is primarily T*8 fluorescent.

Building 35 and 36 – Math Wing Classrooms

The electrical systems for both buildings 35 and 36 are fed from Building 37 providing 120/208 volt, 3*phase, 4*wire power to mostly original distribution panelboards. The panelboards are working but are beyond their rated useful life expectancy.

The lighting was recently upgraded to a combination of recessed and pendant direct/indirect linear T*8 fluorescent fixtures using occupancy sensors. Receptacle outlets are mounted very low and do not meet current ADA requirements. The buildings are not equipped with emergency lighting or illuminated exit signs. This building does not have an emergency generator.

Building 37 – Reprographics

The electrical system at building 37 is fed from a 5 KV unit substation providing 4160 volt distribution to a 300 KVA transformer that provides 1200 amps of 120/208 volt, 3*phase, 4*wire power to buildings 35*39. The unit substation that consists of the 300kVA transformer and 208V distribution are in good working condition. The remainder of the distribution switchboards and panelboards are original to the building and are beyond their rated useful life expectancy. There are conduits that have been cut and have abandoned cabling that should be removed.

The lighting was recently upgraded to a combination of recessed and pendant direct/indirect linear T*8 fluorescent fixtures using occupancy sensors. Receptacle outlets are mounted very low and do not meet current ADA requirements. There are various light switches that are mounted at peculiar heights. The buildings are not equipped with emergency lighting or illuminated exit signs. This building does not have an emergency generator.

Building 38 – Science Office Annex

The offices are fed from Building 37, unidentified panelboard providing 120/208 volt, 3*phase, 4*wire power. There were no panels found within the offices and the exact source panelboard could not be found.
Lighting is primarily T*8 fluorescent surface wraps with typical switches and outlets. The building is not equipped with emergency lighting or any type of lighting controls.

Building 39 – Planetarium and Science Building

The electrical system is fed from Building 37 providing 120/208 volt, 3*phase, 4*wire power.
The existing panelboards are aged and are beyond there rated useful life expectancy. There is a device at the exterior patio area that has come unattached from the ceiling. The exterior fused disconnect at the existing HVAC unit is deteriorating.

Lighting is a combination of T*8 fluorescents, incandescent and compact fluorescents, using typical switches and outlets. The building has wall mounted battery powered emergency lighting units which appear to be operational. Exit signs are present, however, they appear to be self-illuminated type that are not operating properly and are beyond there rated useful life expectancy. Receptacle outlets are mounted very low and do not meet current ADA requirements.

Hazardous Materials (HazMat) Assessment

A visual survey was carried out in the Math and Planetarium complex by Omega Environmental Services Inc. to identify the potential presence of hazardous materials (full report in Appendix). Based on the visual observations made during the limited assessment it is Omega's professional opinion that the following potentially hazardous materials may be present in the subject buildings:

Building 35 – Math Wing

Table 30: Table identifying potentially hazardous materials at Building 35.

Asbestos-containing material (ACM)	▫ 1'x1' acoustic ceiling tile with associated mastic ▫ Drywall and joint compound with rough texture ▫ Vinyl base cove and mastic ▫ Carpet mastic ▫ Vinyl floor covering (12" x12" tiles) and assoc. mastic ▫ Exterior Window putty ▫ Exterior stucco ▫ Exterior paint/skim coat ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic ▫ HVAC system components ▫ Pipe insulation in Mechanical rooms
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Painted structural columns and beams ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

Building 36 – Math Wing

Table 31: Table identifying potentially hazardous materials at Building 36.

Asbestos-containing material (ACM)	▫ 1’x1’ acoustic ceiling tile with associated mastic ▫ Drywall and joint compound with rough texture ▫ Vinyl base cove and mastic ▫ Carpet mastic ▫ Vinyl floor covering (12” x12” tiles) and assoc. mastic ▫ Exterior Window putty ▫ Exterior stucco ▫ Exterior paint/skim coat ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic ▫ HVAC system components
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Painted structural columns and beams ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

Building 37 – Reprographics Center

Table 32: Table identifying potentially hazardous materials at Building 37.

Asbestos-containing material (ACM)	▫ 2’x4’ ceiling tile ▫ 1’x1’ ceiling tile with associated mastic ▫ Drywall and joint compound ▫ Vinyl base cove and mastic ▫ Carpet mastic ▫ Vinyl floor covering and assoc. mastic ▫ Exterior Window putty ▫ Exterior stucco ▫ Exterior paint/skim coat ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Pipe insulation ▫ Roofing material ▫ Roof mastic ▫ HVAC system components

Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Wall and floor ceramic tiles ▫ Urinals, toilet bowls and sinks ▫ Painted structural columns and beams ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

Building 38 – Science

Table 33: Table identifying potentially hazardous materials at Building 38.

Asbestos-containing material (ACM)	▫ 1'x1' ceiling tile with associated mastic ▫ Drywall and joint compound with rough texture ▫ Vinyl base cove and mastic ▫ Carpet mastic ▫ Vinyl floor covering (12" x12" tiles) and assoc. mastic ▫ Exterior Window putty ▫ Exterior stucco ▫ Exterior paint/skim coat ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic ▫ HVAC system components
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Wall and floor ceramic tiles ▫ Urinals, toilet bowls and sinks ▫ Painted structural columns and beams ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

Building 39 – Planetarium

Table 34: Table identifying potentially hazardous materials at Building 39.

Asbestos-containing material (ACM)	▫ 1'x1' ceiling tile with associated mastic ▫ Spray-on acoustic ceiling materials ▫ Drywall and joint compound with rough texture ▫ Vinyl base cove and mastic ▫ Carpet mastic ▫ Vinyl floor covering (12" x12" tiles) and assoc. mastic ▫ Exterior Window putty ▫ Exterior stucco ▫ Exterior paint/skim coat ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic ▫ HVAC system components
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Wall and floor ceramic tiles ▫ Urinals, toilet bowls and sinks ▫ Painted structural columns and beams ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls ▫ Floor drains
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

Mechanical Room

Table 35: Table identifying potentially hazardous materials at the mechanical room.

Asbestos-containing material (ACM)	▫ Plaster materials (wall/ceiling) ▫ Pipe insulation ▫ Mastic ▫ Debris
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ None noted
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures)

Building 93 | Swimming Pool complex

Figure 192: Swimming Pool complex (Bldg. 93), facing southwest.

Brief Physical Description

The Swimming Pool complex (Bldg. 93) is at the northeast corner of the campus in the athletics area. There are two swimming pools oriented north-south with concrete bleachers on the west side of the pool facing east. Below the bleachers is the mechanical room for the pool filters and equipment.

Swimming Pools

The pool to the east is slightly narrower and shallower than the one to the west which has two diving boards at its north end and starting platforms at the south end. The pools are poured concrete bottoms with a recent plaster finish. They have tiled edges as well as black tile lane lines at the bottom and targets at pool ends. Both pools have deep integrated gutters at all sides below the non-original concrete paving. The swimming pool area is bounded on its north and south sides by the Men's (Bldg. 96) and Women's (Bldg. 92) Locker Rooms. At its east side is a tall brick wall with an integrated concrete bench marking the campus boundary along Fairview. At the west end is a concrete masonry unit (CMU) low wall with an integrated concrete bench. At each end of the CMU wall is a tiled pony wall with a drinking fountain and black tile. Chain-link fencing and gates encloses the pool area at the west end.

Bleachers

The concrete bleachers are west of the larger pool behind the CMU wall. They are poured-in-place concrete with a smooth finish. The concrete seating rows are topped with plastic bench seats. There are three stair aisles, one each at the north and south ends and one in the middle. Wood board fencing with a metal top rail are at the north and south ends of the bleachers topped with chain link fencing, which also run along the top of the bleachers. Side stairs at the north and south ends with square metal railing provides access to the bleachers.

Three large sculptural concrete piers support the upper part of the bleachers and create space for mechanical and pool equipment below the bleachers. There are upper and lower level mechanical spaces separated by chain link fencing. The underside of the bleachers and the concrete piers have a board-form finish showing the wood grain of the forms. Large metal exhaust pipes rise to the north and south of the bleachers. A stucco-clad wall to the west of the bleachers encloses the mechanical spaces and creates a solid wall.

A full architectural description can be found in Part 1C: 'Physical Description.'

Complex Condition Summary

The Swimming Pool complex is generally in fair condition.

The concrete around the pools is showing a moderate level of cracking but it was not observed to pose a hazard. The concrete on the bleachers has some areas of deterioration to the edges of steps at the south end and on the underside there are a few spalls related to corroded reinforcement. The tables below summarize the exterior architectural condition (Table 36) and the condition of the building systems (Table 37).

Table 36: Table summarizing the exterior architectural conditions at the Swimming Pool complex.[xi]

Exterior Architectural Conditions													
		Walls			Doors	Bleachers		Pool			Append.		Misc.
Material/ detail		Brick	Wood	Concrete	Steel	Concrete	Railings	Paving	Lining	Fittings	Exterior Walkway	Other	Misc.
Condition	Bldg.												
	93	F	-	F	F	F/P	F/P	F/P	F	F	F	-	G[1]

Notes:
1. Plastic bench tops.

[xi] G = good condition, F = fair condition, P = poor condition (see Table 1 for details).

Table 37. Table summarizing the building systems conditions at the Swimming Pool complex

Building Systems																		
		Structural			MEP			Fire / Life Safety[6]		Environmental[7/8]					Disabled Access		
		Vertical	Lateral	Non-Structural	Mech.	Elec.	Plumb.	Fire	Life Safety	ACM	Lead Paint	Mercury	HCFC	PCB	Site	Entry Doors	Other
Condition	Bldg.																
	93	G	G[1]	F[2-5]	G	F	-	G	G	✓	✓	✓	-	✓	F	-	-

Notes:

1. Torsional irregularity: The estimated distance between the story center of mass and the story center of rigidity in the N-S direction is greater than 20 percent of the bleacher width.
2. Stair anchorage: Ship's ladder into the pit area is not anchored at the top or bottom. Support relies on bracket connection at top concrete curb and rests on concrete slab below with no positive connection.
3. Mechanical and electrical equipment anchorage: An electrical cabinet is not anchored to the concrete slab or wall. In the pit area, the concrete pad at 1 location of pump anchorage has failed.
4. No bracing at attached equipment: 1 large tank is hanging from the concrete bleachers with no bracing.
5. No flexible couplings at gas tank pipes: Piping to 1 large tank appearing to store gas does not have flexible couplings. It appears as if this tank is no longer in use.
6. Building does not currently have sprinkler system.
7. Hazardous Materials assessment consists of visual survey only. Sampling is required to confirm presence.
8. Evidence for hypochlorite identified.

Structural Condition Assessment

The following is a summary of the findings from the structural evaluation of Building 93 the Swimming Pool complex by Risha Engineering (see Appendix 3: Structural Evaluation for full report).

Building 93 – Swimming Pool complex

The Pool Stadium consists of 2 in-ground pools and a reinforced concrete bleacher structure with concrete shear wall and concrete moment frames within the pool complex.

The concrete pools appeared to be in good condition. The slab on grade surrounding the pools typically has minor to moderate cracking throughout.

The bleachers are generally in fair to good condition with minor spalling and efflorescence viewed at the underside of the concrete slab. The bleacher's close proximity to an adjacent canopy is noncompliant. The bleachers have no lateral force resisting system at the west end, which creates a torsional irregularity that is noncompliant. Non-structural items that are noncompliant are: 1 large hanging tank is not braced; failed pump anchorage in the pit area, and; an electrical cabinet is unanchored.

Exterior Condition Assessment – Swimming Pool complex (Building 93)

Swimming Pools

East Brick Wall

The brick wall at the east boundary of the Swimming Pool complex is in fair condition. The brickwork has some hairline cracks within individual bricks and the surfaces of approximately 50% of the bricks are spalling in thin layers roughly 1/8" thick.

Figure 193: Around 50% of the bricks show some surface spalls.

Figure 194: Surface spalls and hairline cracking on the brickwork on the east wall of the Swimming Pool complex.

West Concrete Masonry Unit Pony Wall

The concrete masonry unit (CMU) pony wall separating the pools from the bleachers is in fair to good condition. A couple of hairline cracks were observed in the concrete bench on the east side of the wall running perpendicular to the wall (Figure 195). The joint between the pony wall and the top of the concrete bench to the east and paving slab to the west is cracked along most of its length (Figure 196).

Figure 195: Hairline crack in the concrete bench on the east side of the pony wall.

Figure 196: The joint between the pony wall and the top of the concrete bench is cracked along most of its length.

Paving

The concrete paving slabs surrounding the pools are in fair to poor condition. There is cracking through each slab generally with a dominant crack crossing the center of the slab and commonly with a network of cracks in other areas of the slab (Figure 197). On the south side of the small pool a crack was observed on the side of the slab overhanging the integrated gutter (Figure 198). Oxide staining in patches was common across the paved area (Figure 199). An additional area of concentrated oxide staining was identified on the side of the slab by the entry hand rails at the south of the small pool (Figure 200).

Figure 197: Cracking at the east side of the small pool.

Figure 198: Crack on the side of the slab overhanging the integrated gutter at the southwest corner of the small pool.

Figure 199: Oxide staining on the concrete slab paving at the north east corner of the complex.

Figure 200: Concentrated oxide staining on the side of the slab by the entry hand rails at the south of the small pool.

Swimming Pool lining

The pool lining was generally in fair condition. At the south ends of both of the pools some shallow dents were noted at the base of the pool. Staining was present around the edges of the filters in the base of both pools- possibly corrosion but more likely algal growth.

Figure 201: Shallow dents at the base of the south end of the large pool.

Figure 202: Staining around the edges of the filters in the base of the large pool.

Fittings

The fittings around the pools including the diving boards and handrails were in fair condition. Corrosion and tarnishing was present on the starting platforms (Figure 203) and on areas of the handrails- mostly concentrated near the base (Figure 204).

Figure 203: Corrosion on the starting platforms of the large pool.

Figure 204: Tarnishing or corrosion on the entry handrail.

Bleachers

Concrete Bleacher seating structure

The concrete bleacher seating structure is in fair to poor condition, there is currently a chain link fence blocking the entries indicating that it is currently out of use. Network cracking was present on the treads of the steps and seats which may just be in the surface finish or may go through to the concrete below (Figure 205). The edges on two of the steps on the south end of the bleachers were damaged with one having lost an area of material (Figure 206) and the other with an incipient spall (Figure 207). One crack was identified related to a seat fixture running through the corner of a seat possibly related to oxide jacking of the fixture.

The white paint on the risers of the steps is blistering (Figure 208).

At the outer edges of the steps at each end of the bleachers there is heavy oxide staining which appears to be related to corroded fasteners in the railings above (Figure 210). Similarly there is oxide staining along the back of the top step.

Figure 205: Cracking in the bleacher treads.

Figure 206: Missing material on the left-hand steps that has been painted over.

Figure 207: Insipient spall on the left-hand steps.

Figure 208: Crack at the corner of a seat possibly related to the fixture above.

Figure 209: Peeling paint on the risers of the steps.

Figure 210: Oxide staining at the edge of the steps.

Underside of Bleachers

The underside of the bleachers is in fair to poor condition. Spalls related to oxide jacking of rebar (Figure 211) and cracked areas with the potential to spall (Figure 212) were observed in a handful of locations. There are several pockmarks where the reinforcement ties are present. Previous fasteners have left small holes in areas of the wall.

Figure 211: Spalled concrete related to oxide jacking of the rebar.

Figure 212: Cracked area with the potential for material loss.

West Wall

The stucco-finished west wall is in fair to good condition. There is a minimal amount of damage identified to the paintwork at the base of the west side of the wall, particularly at the outer corners (Figure 213). On the south end of the east side of the wall there is a long crack running horizontally and vertically (Figure 214).

Figure 213: Minimal damage to the paintwork at the base of the west side of the wall.

Figure 214: Crack on the south end of the east side of the wall.

Flooring below Bleachers

The flooring below the bleachers is in fair condition. There are patches of oxide staining and minimal cracking (Figure 215).

Figure 215: Oxide staining on the concrete paving below the bleachers.

Doors

The doors to the mechanical space below the bleachers from the west are in fair condition. There frame has a moderate level of corrosion (Figure 216).

Figure 216: Corroded door frame on the east side of the west wall.

Seats

The plastic seats on the bleachers are in good condition.

Railings & Fence

The railings and fence surrounding the bleachers are in fair to poor condition. The metal rail is in fair condition, however the paint is chipped and deteriorating (Figure 217). Ferrous fasteners are heavily corroded causing oxide staining to the concrete stairs below. The paint on the wood board fence is peeling and in poor condition and the wood below is showing signs of deterioration.

Figure 217: Outside of the railings and fence at the south side of the bleachers showing a loss of paint on the railings, peeling paint on the wood fence, and corrosion of ferrous fasteners.

Mechanical Equipment

The mechanical equipment below the bleachers is visibly in fair to poor condition. Several of the pieces of equipment appear outdated and abandoned and these tend to show significant levels of corrosion (Figure 218), as do some of the pipes.

Figure 218: Corroded casing to pool lights controls.

Plumbing Assessment

No comments made in the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

Mechanical (heating, ventilating, and air conditioning) Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

- The pool has a new Lochinvar Copper Fin 2 CPN2072, 1,999,999 BTU/H with a ¾ hp Armstrong pump.

Fire and Life Safety Assessment

The following is a summary of the visual examination undertaken by Jensen Hughes of the fire protection systems and life safety features of the facilities at the Swimming Pool complex, Building 93 (see Appendix 5: 'Fire and Life Safety Evaluation' for full report). No system testing or intrusive inspections were conducted by Jensen Hughes personnel.

Table 38: Swimming Pool complex fire protection/life safety systems- the following table shows the surveyed buildings in the complex (Bldg. 93) identifying the systems currently provided.

Bldg. No.	Building Name	Sprinklered	Fire Alarm	Fire Extinguisher	Fire Hose Reel	Adequate Egress	Comments
93	Swimming Pool	N	Y	Y	Y	Y	-

Note: N means the system is not provided for the building. Y means the system is provided for the building.

Electrical Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

Building 93 – Swimming Pool complex

The existing switchgear including 4160V transformers and distribution that feed a majority of the gym complex are located below the pool stadium bleachers which consists of two 5.5 KV 200 amp switches providing 4160 volt power to two Transformers. A 225 KVA transformer 'T6A' provides 400 amps of 480/277 volt, 3*phase, 4*wire power. A 300 KVA transformer 'T6' provides 800 amps of 120/208 volt 3*phase 4*wire power to 1970s vintage local distribution panels. Both transformers appear to be in good working condition, however, the electrical panels and disconnects show signs of corrosion and should be replaced.

Hazardous Materials (HazMat) Assessment

A visual survey was carried out in the Swimming Pool complex by Omega Environmental Services Inc. to identify the potential presence of hazardous materials (full report in Appendix). Based on the visual observations made during the limited assessment it is Omega's professional opinion that the following potentially hazardous materials may be present in the subject buildings:

Building 93 – Swimming Pool complex

Table 39: Table identifying potentially hazardous materials at Building 93.

Asbestos-containing material (ACM)	▫ Pipe insulation ▫ Elbows ▫ Mastic ▫ Grout ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes

Lead based paints (LBP)	▫ Painted floor ▫ Painted wall surfaces and handrails ▫ Ceramic tiles
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ None noted
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking
Miscellaneous	▫ Hypochlorite

Buildings 105, 110 | Stadium and Field House

Figure 219: Stadium and Field House. The Field House (Bldg. 110) is at the center back of the image, looking south.

Brief Physical Description

The LeBard Stadium (Bldg. 105) and Field House (Bldg. 110) are in the northeast corner of the campus. The Field House serves the stadium and is located at its southern end.

LeBard Stadium (Bldg. 105)

Oriented north-south, the stadium consists of a below-grade football field with berms to the east and west in to which concrete bleachers are built; the east berm's east side also supports smaller bleachers for the track to the east. The bleachers curve slightly to give the stadium a bowl effect and improve sight lines. Low, board-formed concrete walls create planters and a wall to the southern end of the stadium that is broken for vehicular access. The north end has a low berm with two sets of concrete stairs. Disabled access ramps with concrete masonry unit walls extend to the field at the north and south ends.

The bleachers are poured-in-place concrete with a smooth finish and have aluminum metal bench seats. A press box is at the top of each bleacher. The east press box is spans across the center seating section, is rectangular in plan with a flat roof and roof deck with non-original metal railing and is accessed from a ladder on the press box's south façade and by a set of non-original stairs at the north end. There is a wood trellis extending at the south end. The west façade is partially glazed and partially open above a flexboard fascia. The press box centered at the top of the west bleachers is smaller and in the southern corner of the central seating section. It is also rectangular in plan with a flat roof and overhangs but is simpler than then east press box. It is partially glazed on the west façade facing the field and does not have a roof deck.

Field House (Bldg. 110)

The Field House is a one-story, rectangular building with a flat, wood-rafter roof that creates deep overhangs around most of the building. The overhangs have exposed rafters and a box eave. The foundation is concrete slab on grade while the building is wood-framed with alternating areas of stucco, plywood, and Flexboard and batten cladding. The Flexboard panels have an aluminum-framed hopper window at the top of each board. Concession areas at the east and west ends of the building have lift-up plywood boards to be opened when in operation. An L-shaped brick wall is present as a screen on the south side of the building. Original wood doors are found throughout the building. Non-original windows with dark glazing are in some of the stucco walls.

A full architectural description can be found in Part 1C: 'Physical Description.'

Complex Condition Summary

The Stadium and Field House is in a fair to poor condition. There are some significant areas of spalling related to corroding reinforcement on the bleachers and related rust staining. The roof at the field house is in a poor condition which is resulting in water ingress issues. The tables below summarize the exterior architectural condition (Table 40) and the condition of the building systems (Table 41).

Table 40: Table summarizing the exterior architectural conditions at the LeBard Stadium.[xii]

Exterior Architectural Conditions																
		Press Boxes												*Bleachers*		Misc.
		Walls			Windows				Doors			Roof				
Material		Brick	Wood	Concrete	Alum. Operable	Alum. Clerestory	Aluminum Fixed	Other	Wood	Steel	Other	Low Slope	Copper Dome	*Concrete*	*Railings*	Miscellaneous
Condition	Bld.															
	105	-	F	-	-	-	F/P	-	G	-	-	P	-	F/P	F	-

[xii] G = good condition, F = fair condition, P = poor condition (see Table 1 for details).

Table 41: Table summarizing the exterior architectural conditions at the Field House.

Exterior Architectural Conditions																
		Walls			Windows				Doors			Roof		Append.		Misc.

Condition	Bld.															
	110	-	G	-	-	-	F	G	G	-	-	P	-	-	F	F

Notes:
1. Lift-up plywood boards at concession areas.

Table 42: Table summarizing the building systems conditions at the Stadium and Field House.

Building Systems																	
		Structural			MEP			Fire / Life Safety[10]		Environmental[11]					Disabled Access		
		Vertical	Lateral	Non-Structural	Mech.	Elec.	Plumb.	Fire	Life Safety	ACM	Lead Paint	Mercury	HCFC	PCB	Site	Entry Doors	Other
Condition	Bldg.																
	105	G	F[2-6]	G	G	F	-	G	G	✓	✓	✓		✓	G	F	P[9]
	110	F[1]	G[7]	F[8]	P	F	F/P	G	G	✓	✓	✓	✓	✓	F	F	-

Notes:
1. Deterioration of wood: Signs of moderate decay and splitting is typically visible in the wood members, most notably in exterior locations.
2. East and west press boxes, redundancy: The longitudinal direction only contains 1 line of plywood shear walls in each press box. The transverse direction only contains 1 line of plywood shear walls in the west press box only.
3. East and west press boxes, openings: The west wall (East Press Box) and east wall (West Press Box) has windows along entire length, and no wood structural panel shear walls are present for bracing.
4. West press box, narrow wood shear walls and shear overstress: The 1 shear wall in the transverse direction has an aspect ratio greater than 2-to-1 and has a shear stress of over 1,000 plf, both maximum limits for Life Safety.
5. Concrete bleachers and concrete podium, deterioration of concrete: Minor to moderate spalling with exposed rebar was typically viewed at the bleacher risers and East Press Box concrete podium at the south stairs.
6. Concrete podium, openings at shear walls: Diaphragm openings in the concrete slab immediately adjacent to the east concrete wall account for approximately 50% of the wall length. Due to the low

seismic shear being transferred to this concrete wall, this deficiency appears to be minor.

7. Diaphragm span: Diagonally sheathed diaphragm has 1 horizontal span which is 60 feet, more than the 40 feet limit for Life Safety.
8. Tall narrow contents: 1 cabinet, 1 refrigerator and multiple storage racks are not anchored to the floor or wall.
9. No disabled access to press boxes.
10. Building does not currently have sprinkler system.
11. Hazardous Materials assessment consists of visual survey only. Sampling is required to confirm presence.

Structural Condition Assessment

The following is a summary of the findings from the structural evaluation of Buildings 105 and 110, Stadium and Field House, by Risha Engineering (see Appendix 3: Structural Evaluation for full report).

Building 105 – LeBard Stadium with Press Boxes

The Stadium site consists of reinforced concrete slab on grade bleachers constructed on earthen berms at either side of the playing field. A press box on the east bleachers is one story wood construction with wood rafter and plywood roof supported by wood framed shear walls. The wood structure is supported on a concrete podium structure. A press box on the west bleachers is supported from the concrete bleachers and is one story wood framed with 1 plywood shear wall in each direction. No structural drawings are available for this press box.

The bleachers are in fair condition with spalling and exposed rebar typically viewed throughout. The press boxes are in fair condition with deterioration typically evident.

The wood shear walls are typically noncompliant in both press boxes. The longitudinal direction only contains 1 line of plywood shear walls in each press box. The transverse direction only contains 1 line of plywood shear walls in the west press box only. Additionally, narrow wood shear walls are present which is not compliant. Openings in the concrete podium slab immediately adjacent to the east concrete shear wall are noncompliant.

Building 110 – Field House

Building 110 is a one story wood frame building located at the south end of the stadium playing field. The roof is diagonal sheathing spanning roof rafters supported at stud walls and on an interior steel beam. Steel columns and wood posts support the steel beam on spread footings. Diagonally sheathed wood shear walls provide the lateral force resisting system.

The building appears to be in fair condition, although there is general wood deterioration throughout the structure, primarily in exterior locations. Unblocked wood diaphragm spans exceed the maximum limits, which is noncompliant. Several tall narrow contents are unanchored, which is also noncompliant.

Exterior Condition Assessment– LeBard Stadium (Bldg. 105)

Bleachers

The bleachers at the LeBard Stadium are in fair to poor condition. The concrete is showing several forms of deterioration but the predominant issue is the corrosion of the embedded steel reinforcement in the risers resulting in oxide jacking and spalling of the concrete surface (Figure 220). There are a few isolated incidents of this, but one predominant area is along a riser at mid-height on the east bleachers where corroded vertical reinforcement is visible along the whole level of the section north of center (Figure 221). Concrete cover appears to have been deficient at this level.

The railings are also showing corrosion at their bases in some locations on both the east and west bleachers. In some locations this is just visible as cracks through the concrete (Figure 222), and in others the surrounding concrete has failed revealing heavily corroded bases of the railings (Figure 223). This corrosion has also resulted in significant oxide staining of the concrete in several locations (Figure 224).

A low level of cracking was identified in localized areas of the poured concrete slab around the stadium (Figure 225). Isolated hairline cracks were also noted on the bleacher steps.

The concrete was identified to have an inherent defect in certain areas where there was seen to be a high level of voids or air pockets within the concrete (Figure 226Figure 231).

Plant growth was present in cracks and crevices in various places on the bleachers (Figure 227).

Figure 220: Corroded rebar causing oxide jacking and concrete spalling on the east bleachers.

Figure 221: Vertical reinforcement visible and corroded along a whole level of the section north of center on the east bleachers.

Figure 222: Cracking at a corner of the west bleachers associated with the railings fixtures.

Figure 223: Heavy corrosion has resulted in oxide jacking and loss of a significant area of concrete on a corner at the east bleachers.

Figure 224: Corrosion of the base of a steel railing upright on the east bleachers has resulted in significant oxide staining on the steps below.

Figure 225: Localized area of cracking of the concrete slab at the top of the east bleachers.

Figure 226: Concrete displaying a high level of air voids on the east bleachers and a vertical crack.

Figure 227: Plant growth in a crevice at the side of the steps on the west bleachers.

Press Boxes

The press boxes appear to be in fair to good condition. The roof structure overhanging to the south showed some splits or checks in the wood beams but these did not appear to be significant (Figure 228). The glazing needs resealing as it appears the frames have either shifted or the sealant has been lost (Figure 229). The wooden sill below the window shows signs of deterioration and loss of paint.

At the south end of the roof of the east press box there is a gap in the railings posing a fall hazard.

Figure 228: Roof structure overhanging to the south of the east press box showing some splits or checks in the wood beams.

Figure 229: Gap between glazing and aluminum frame on east press box and deterioration of wooden sill.

Figure 230: Gap in the railings at the south end of the east press box roof posing fall hazard.

Landscaping- walls, planters, etc.

The hard landscaping around the stadium is in fair condition with localized issues. A crack running the full height of a wall on the east side of the stadium south of the bleachers was identified (Figure 231). The ramp access to the stadium from the northwest corner was showing significant levels of corrosion staining at the base of the railings (Figure 232).

Figure 231: Crack running through a low wall on the east side of the stadium south of the bleachers.

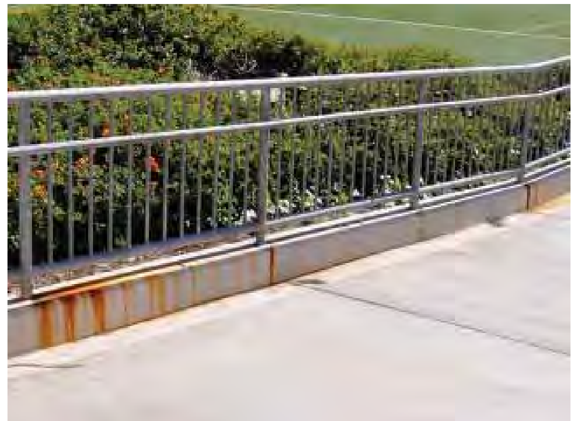

Figure 232: Significant levels of corrosion staining at the base of the railings on the ramp access to the stadium from the northwest corner.

Exterior Closure Condition Assessment– Field House (Bldg. 110)

Exterior Walls

<u>Brick</u>

The small brick wall on the south side of the Field House is in fair condition. A small area at the exposed end of the wall has lost its mortar (Figure 233) and the brick-mortar interface is cracked in a few locations.

Figure 233: Brick wall at the south of the Field House with area of mortar missing visible.

<u>Stucco- and Wood-Clad Wood-Frame Walls</u>

The wood-framed walls at the Field House with a variety of finishes- stucco, plywood, flexboard, and batten cladding- appear to be in good condition.

Windows

Aluminum Windows

The aluminum windows on the Field House appear to be in fair condition with a dull patina to the aluminum frames.

Figure 234: Dull patina on the aluminum window frames on north façade of Field House.

Exterior Doors

Wood Doors

The wooden doors on the Field House appeared to be in good condition.

Roofing

Low-Slope Roof

The low-slope roof on the Field House appeared to be in poor condition. The membrane roof covering has been laid directly over a previous roof cover and is in poor condition. A patch was observed close to the center of the north side which had buckled edges although the seal still appeared to be good. Beside this at the roof edge there appeared to be a gap or tear at the top of the flashing, possibly associated with movement or failure of the flashing and/or soffit (Figure 235).

The flashing was seen to be displaced on the north façade (Figure 236) and in several areas the paint was peeling on the flashing and wooden soffit below (Figure 237).

One of the conduits on the roof was corroded along its length (Figure 238). The sheathing around other conduits has failed with a small amount of the detached material remaining (Figure 239).

There is a small accumulation of plant detritus around the conduits attached to the roof (Figure 240).

The roof has no rainwater dispersal system and there was some evidence of water pooling near the south edge of the roof.

Figure 235: Buckling patch on roof and small hole in membrane at edge of roof at the center of the north side.

Figure 236: Displaced flashing on the north side of the building.

Figure 237: Paint peeling from the flashing and soffit at the east end of the Field House.

Figure 238: Corroded conduit (left) and remaining detached sheathing (center and right conduits) on the roof of the Field House facing east.

Figure 239: Remaining detached sheathing on the roof of the Field House.

Figure 240: Accumulation of plant detritus around the conduits on the roof of the Field House.

Miscellaneous Features

Concession Areas

The lift-up plywood boards at either end of the Field House appeared to be in fair condition. At the east end there was some soiling occurring below the grills (Figure 241), and at the west end a small area of damage was identified to the plywood where an area of the painted surface was lost (Figure 242).

Figure 241: Soiling below the grills at the east end of the Field House.

Figure 242: Small area of damage to plywood on west end of south façade.

Interior Condition Assessment– Field House (Bldg. 110)

The Field House interiors are in fair to poor condition.

The concrete slab floors in the Field House have thin meandering cracks and crazing. These have either been filled or do not appear to pose a visible hazard (Figure 243).

The wall and floor surfaces are generally in fair condition but showing signs of wear and tear (Figure 244).

A metallic door and frame are showing rust at the base (Figure 245).

A surface-mounted strip light in the restroom has a high level of water staining indicating moisture ingress from the roof at this location (Figure 246).

Partial repairs have been undertaken in the mechanical room with partial painting of the ceiling and patching of holes in the wall (Figure 247).

The sink and drain in the concessions room are showing high levels of corrosion (Figure 248).

Figure 243: Cracking and crazing on concrete slab floors, Field House, Building 110.

Figure 244: Signs of wear and tear on the wall and floor surfaces, Field House, Building 110.

Figure 245: Rusting at the base of door, Field House, Building 110.

Figure 246: Water staining on light fixture in restroom indicating water ingress from roof, Field House, Building 110.

Figure 247: Partial repairs undertaken in mechanical room, Field House, Building 110.

Figure 248: Rusted fixtures in the concessions room, Field House, Building 110.

Plumbing Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

- The field house restrooms are cold water only and are in fair condition. The fixtures are starting to shows signs of extended use. No major defects or leaks were visible from the fixtures.
- Hot water for the restrooms is from a 100 Gallon Gas fired water heater. American CG32100T774NOV, 75,000 BTU/H input rating. The water heater is in fair condition.

Mechanical (heating, ventilating, and air conditioning) Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

The Field House is served via a Trane WCC060F100BE 5 Ton heat pump unit. The unit is in poor condition, coil fins are flaking off. The boiler for the showers has been abandoned. The roof mounted exhaust fans for the restrooms are in fair condition.

Fire and Life Safety Assessment

The following is a summary of the visual examination undertaken by Jensen Hughes of the fire protection systems and life safety features of the facilities at the Stadium and Field House, Buildings 105 and 110 (see Appendix 5: 'Fire and Life Safety Evaluation' for full report). No system testing or intrusive inspections were conducted by Jensen Hughes personnel.

Table 43: Stadium and Field House fire protection/life safety systems- the following table shows the surveyed buildings (Bldgs. 105 & 110) identifying the systems currently provided.

Bldg. No.	Building Name	Sprinklered	Fire Alarm	Fire Extinguisher	Fire Hose Reel	Adequate Egress	Comments
105	Stadium	N	Y	Y	Y	Y	-
110	Field House	N	Y	Y	Y	Y	-

Note: N means the system is not provided for the building. Y means the system is provided for the building.

Electrical Assessment

The following are notes from the MEP Evaluation report produced by Design West Engineering (see Appendix 4 for full report).

Building 105 & 110 –Stadium and Field House

The Field House electrical system is fed from Powerhouse "C" with 120/240 volt, 1*phase, 3*wire power to original local distribution. The existing panelboards A, B and C have recently been replaced and are in good working condition.

Lighting in the field house is provided by T*8 fluorescent using typical switches and outlets. The building is not equipped with emergency lighting or illuminated exit signs. This building does not have a noted emergency generator.

The Stadium lights are powered from a recently installed 750kVA unit substation through 480V distribution, located in an exterior yard south east of the stadium. The unit substation and associated 480V distribution equipment is in good working condition.

The panelboards within the score booths are original to the buildings and are beyond their rated useful life expectancy.

Hazardous Materials (HazMat) Assessment

A visual survey was carried out in the Stadium and Field House by Omega Environmental Services Inc. to identify the potential presence of hazardous materials (full report in Appendix). Based on the visual observations made during the limited assessment it is Omega's professional opinion that the following potentially hazardous materials may be present in the subject buildings:

Building 105 – Stadium

Table 44: Table identifying potentially hazardous materials at Building 105.

Asbestos-containing material (ACM)	▫ Drywall and joint compound ▫ Transite panels ▫ Exterior Window putty ▫ Exterior stucco ▫ Exterior paint/skim coat ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Roof mastic
Lead based paints (LBP)	▫ Painted wood members ▫ Painted wall surfaces ▫ Painted handrails and posts
Mercury	▫ Painted wood members ▫ Painted wall surfaces ▫ Painted handrails and posts
Hydrochlorofluorocarbon (HCFC)	▫ None noted
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

Building 110 – Field House

Table 45: Table identifying potentially hazardous materials at Building 110.

Asbestos-containing material (ACM)	▫ Acoustic ceiling tiles ▫ Drywall and joint compound ▫ Vinyl base cove and mastic ▫ Carpet mastic ▫ Transite panels ▫ Pipe insulation ▫ Tank insulation ▫ Exterior Window putty ▫ Exterior stucco ▫ Exterior paint/skim coat ▫ Concrete ▫ Exterior concrete expansion joints ▫ Exterior sub-surface transite pipes ▫ Roofing material ▫ Transite pipes ▫ Roof mastic ▫ HVAC system components
Lead based paints (LBP)	▫ Painted door and window systems ▫ Painted wall surfaces ▫ Floor drain ▫ Painted wood ceiling ▫ Roof systems (fascia, eves, gutters, etc.) ▫ Exterior painted walls ▫ Painted concrete floor ▫ Sinks, Toilet bowls and Urinals ▫ Ceramic tiles
Mercury	▫ Fluorescent light bulbs
Hydrochlorofluorocarbon (HCFC)	▫ HVAC system
Tritium gas	▫ None noted
Polychlorinated biphenyls (PCB)	▫ Ballast (fluorescent fixtures) ▫ Concrete expansion joint caulking ▫ Window caulking

PART 2 – TREATMENT AND WORK RECOMMENDATIONS

PAGE INTENTIONALLY LEFT BLANK

HISTORIC PRESERVATION OBJECTIVES

This section discusses preservation objectives for the buildings and structures included in the Historic District at Orange Coast College.

The Secretary of the Interior's Standards for Rehabilitation & Guidelines for Rehabilitating Historic Buildings (Standards) provide guidance for reviewing proposed work on historic properties, with the stated goal of making possible "a compatible use for a property through repair, alterations, and additions while preserving those portions or features which convey its historical, cultural, or architectural values."[1]

The Standards are used by Federal agencies in evaluating work on historic properties. The Standards have also been adopted by local government bodies across the country for reviewing proposed rehabilitation work on historic properties under local preservation ordinances. The Standards are a useful analytical tool for understanding and describing the potential impacts of substantial changes to historic resources. Projects that comply with the Standards benefit from a regulatory presumption that they would have a less-than-significant adverse impact on a historic resource.[2] Projects that *do not* comply with the Standards may cause either a substantial or less-than-substantial adverse change in the significance of a historic resource.

The Standards offers four sets of standards to guide the treatment of historic properties: Preservation, Rehabilitation, Restoration, and Reconstruction. The four distinct treatments are defined as follows:

> **Preservation:** The Standards for Preservation "require retention of the greatest amount of historic fabric, along with the building's historic form, features, and detailing as they have evolved over time."
>
> **Rehabilitation:** The Standards for Rehabilitation "acknowledge the need to alter or add to a historic building to meet continuing new uses while retaining the building's historic character."
>
> **Restoration:** The Standards for Restoration "allow for the depiction of a building at a particular time in its history by preserving materials from the period of significance and removing materials from other periods."
>
> **Reconstruction**: The Standards for Reconstruction "establish a limited framework for recreating a vanished or non-surviving building with new materials, primarily for interpretive purposes."

---

[1]National Park Service, *The Secretary of the Interior's Standards for Treatment of Historic Properties,* accessed online at http://www.nps.gov/tps/standards.htm on April 1, 2015.
[2] CEQA Guidelines subsection 15064.5(b)(3).

Typically, one set of standards is chosen for a project based on the project scope. In this case, due to the variety of resource types being evaluated and the differing preservation objectives, two sets of standards have been chosen.

The Theater (Building 2) and Stadium (Bldg. 105) will continue with their current uses. The *Standards for Preservation* should guide the treatment at these locations.

For buildings where their current use is being relocated to new construction on campus, the *Standards for Rehabilitation* will be applied. Rehabilitation allows for compatible new use and associated upgrades to buildings.

Rehabilitation is the recommended treatment for the Student Success Center and Classroom & Labs complex (Bldgs. 7-9), Business Education complex (Bldgs. 12-14), and Math and Planetarium complex (Bldgs. 35-39). The Swimming Pool complex (Bldg. 93) and Field House (Bldg. 110) should also follow a rehabilitation treatment.

The following is a more detailed overview of the *Standards for Preservation* and the *Standards for Rehabilitation.*

Standards for Preservation

Preservation Standard 1: A property will be used as it was historically, or be given a new use that maximizes the retention of distinctive materials, features, spaces, and spatial relationships. Where a treatment and use have not been identified, a property will be protected and, if necessary, stabilized until additional work may be undertaken.

Preservation Standard 2: The historic character of a property will be retained and preserved. The replacement of intact or repairable historic materials or alteration of features, spaces, and spatial relationships that characterize a property will be avoided.

Preservation Standard 3: Each property will be recognized as a physical record of its time, place, and use. Work needed to stabilize, consolidate, and conserve existing historic materials and features will be physically and visually compatible, identifiable upon close inspection, and properly documented for future research.

Preservation Standard 4: Changes to a property that have acquired historic significance in their own right will be retained and preserved.

Preservation Standard 5: Distinctive materials, features, finishes, and construction techniques or examples of craftsmanship that characterize a property will be preserved.

Preservation Standard 6: The existing condition of historic features will be evaluated to determine the appropriate level of intervention needed. Where the severity of deterioration requires repair or limited replacement of a distinctive feature, the new material will match the old in composition, design, color, and texture.

Preservation Standard 7: Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.

Preservation Standard 8: Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.

Standards for Rehabilitation

Rehabilitation Standard 1: *A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces, and spatial relationships.*

Rehabilitation Standard 2: *The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize the property will be avoided.*

Rehabilitation Standard 3: *Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other historical properties, will not be undertaken.*

Rehabilitation Standard 4: *Changes to a property that have acquired significance in their own right will be retained and preserved.*

Rehabilitation Standard 5: *Distinctive materials, features, finishes and construction techniques or examples of craftsmanship that characterize a property will be preserved.*

Rehabilitation Standard 6: *Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature will match the old in design, color, texture, and, where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.*

Rehabilitation Standard 7: *Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.*

Rehabilitation Standard 8: *Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measure will be undertaken.*

Rehabilitation Standard 9: *New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work shall be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and environment.*

Rehabilitation Standard 10: *New additions and adjacent or related new construction will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.*

REQUIREMENTS FOR WORK

This section outlines applicable laws, regulations and functional requirements, which must be taken into account prior to any preservation and rehabilitation work.

Any preservation and rehabilitation should be evaluated with respect to conformance with applicable state and municipal codes and standards required by law. All work to the building must comply with the California Building Code (CBC) and Title 24 Part 8 of the California Code of Regulations.

Projects at community colleges are state-regulated and require Department of State Architect (DSA) review and approval of design and construction. Specifically, DSA reviews access compliance and structural safety of designs.

As the Orange Coast College Historic District has been identified as eligible for the National Register and California Register the contributing buildings qualify to take advantage of the California Historical Building Code (CHBC) with regard to code compliance. The CHBC is intended to be used by any agency with jurisdiction when reviewing code compliance for a qualified historic building in order to ensure its preservation. As stated in the CHBC Section 8-101.2:

The CHBC is intended to provide solutions for the preservation of qualified historical buildings or properties, to promote sustainability, to provide access for persons with disabilities, to provide a cost-effective approach to preservation, and to provide for reasonable safety of the occupants or users. The CHBC requires enforcing agencies to accept solutions that are reasonably equivalent to the regular code (as defined in Chapter 8-2) when dealing with qualified historical buildings or properties.

WORK RECOMMENDATIONS AND ALTERNATIVES

Buildings 7, 8, 9 | Student Success Center and Classroom & Labs Complex

There are four reuse options for the Student Success Center and Classroom & Labs complex (Bldgs. 7 -9), as follows:

Alternatives 1A and 1B:	Alternatives 1A and 1B adaptively reuse the complex for Administrative Services. Alternatives 1A and 1B remove later additions to the east and west of the Student Success Center (Bldg. 7).
Alternative 1C:	Alternative 1C adaptively reuses the complex for Administrative Services and Theater Pre-Function. Alternatives 1C and 2A keep the later additions at the east and west of the Student Success Center (Bldg. 7).
Alternatives 2A:	Alternative 2A adaptively reuses the complex for Administrative Services and Special Services. Alternative 2A keeps the later additions at the east and west of the Student Success Center (Bldg. 7).
Alternatives 2B:	Alternative 2B adaptively reuses the complex for the Dance Program. Alternative 2B includes a new addition and keeps the east addition at the Student Success Center (Bldg. 7).

Schematic drawings and diagrams illustrating treatment recommendations for the complex are included in Appendix 1.

Figure 1: Student Success Center and Classroom & Labs complex (Bldgs. 7 -9),[3]

[3] All photographs in this section of the Historic Resources Report were taken by Page & Turnbull, 2014-2015,

Selective Demolition

Selective demolition varies at the Student Success Center (Bldg. 7) based on the alternative. Selective demolition at the Classroom & Labs (Bldgs. 8 & 9) are nearly identical at all alternatives. Note that removal and replacement of individual items may be described later under the specific system.

Removal of Inappropriate Additions

See plans for location of additions to be removed. The original roof forms at the Student Success Center (Bldg. 7) have been obscured. Currently, a sloped metal roof covers the original clerestory windows at the south side of Building 7. The alternatives propose to restore the original volume of the building by removing the metal roof and boxed stucco parapet above the original low-slope roof. Removing the metal and parapet roofs will allow for the return of the south facing clerestory windows. See plan for locations.

All rooftop heating, ventilation and air-conditioning (HVAC) equipment located on the canopy of the Classroom & Labs (Bldgs. 8 & 9) will be removed.

Removal of Hazardous Materials

A limited survey and sampling of asbestos containing materials (ACMs) was completed in 2005. A visual survey was completed as part of the Historic Structures Report in January 2015. This recent survey identified additional potentially hazardous materials including ACMs, lead based paint (LBP), mercury, polychlorinated biphenyls (PCBs) and miscellaneous materials.

Asbestos: The 2005 survey identified window putty, leveling compound, linoleum flooring, vinyl floor tile, and transite pipe as ACMs. A visual survey and assessment completed as part of the Historic Structures Report in January 2015 determined that additional ACMs may be present. Amongst those materials suspected of being ACMs are acoustic ceiling tile, vinyl base and carpet mastic, insulation, grout, exterior expansion joints, counter top and sheet flooring. The complete list is contained in Appendix 6: Hazardous Materials Visual Assessment Report.

Lead: The January 2015 visual survey identified several items that potentially contain lead paint including, but not limited to, painted door and window systems, exterior painted walls, ceramic tile and roof systems. For more detail see Appendix 6: Hazardous Materials Visual Assessment Report.

PCB: The January 2015 visual survey identified potential polychlorinated biphenyls (PCBs) in the ballast at fluorescent fixtures, concrete expansion joint caulking and window putty.

Other: Mercury was identified in the fluorescent light bulbs.

Structural

Foundations

Foundations for Shear Walls

New Foundation

Alternatives 1A and 1B, Student Success Center (Bldg. 7): Removal of east and west additions will require new masonry shear walls at the east and west walls. Assume new foundation needed. See plan for extent.

Alternatives 1C and 2A, Student Success Center (Bldg. 7): No new foundation walls required.

Alternative 2B, Student Success Center (Bldg. 7): Removal of west addition will require new masonry shear wall between the existing building and new dance addition. Assume new foundation needed. See plan for extent. No new foundations at the Classroom & Labs (Bldgs. 8 & 9).

Gravity Load Systems

Bearing Walls

No new bearing walls are required.

Posts / Columns

No new posts or columns are required

Roof

Assume additional roof framing may be required following the removal of the metal roof and boxed parapet roof at the south side of the Student Success Center (Bldg. 7). Assume additional 2 x 8 framing sistered to existing wood rafters. Amount of roof area varies per alternative. See roofing section for square footage.

At the covered walkway adjacent to the service building south of the Classroom & Labs (Bldg. 9) there is severe deterioration of the beam at the covered walkway. This beam requires replacement.

Lateral Load Systems

Deficiencies in the lateral load system may be addressed with either new shear walls or steel moment or braced frames. The narrative explains both options. The cost estimate prices only moment frames; shear walls would have a comparable cost. Additional design development is required to determine which structural retrofit strategy is appropriate.

Shear Walls

New Shear Walls

New shear walls are required at the Student Success Center (Bldg. 7) to address changes in the configuration of the space and the removal of additions.

Alternatives 1A and 1B: Student Success Center (Bldg. 7): New concrete / brick shear walls to enclose the space after the additions are removed.

Alternatives 1C and 2A: Student Success Center (Bldg. 7): New plywood shear wall at the interior of the east wing of Building 7. Length of shear wall is 32 feet. New foundation required. Assume upgrades to existing shear walls at the east wing of Building 7. There are two shear walls, each measuring 32 foot in length that will require strengthening.

Alternative 2B: Student Success Center (Bldg. 7): New plywood shear wall at the east wing of Building 7. Length of shear wall is 32 feet. New foundation required. Assume upgrades to existing shear walls at the east wing of Building 7. There are two shear walls, each measuring 32 foot in length that will require strengthening.

All Alternatives: Classroom & Labs (Bldgs. 8 & 9): As an alternate to Steel Moment and Braced Frames (see below) at the north wall of Building 8 and 9, provide shear walls at the interior of the building. See appendix A within Appendix 3 Structural Evaluation.

For Building 8, assume two (2) locations. Both locations 8-foot in length. Saw cut existing slab, excavate and install new foundation, patch slab.

For Building 9, assume three (3) locations. One (1) location 16-foot in length and two (2) locations 8-foot in length. Saw cut existing slab, excavate and install new foundation, patch slab.

Moment or Braced Frames

New Moment or Braced Frames

Classroom & Labs (Bldgs. 8 & 9): Provide new steel moment or braced frames at entire length of north wall. Assume column spacing at 24 feet on center. Assume six (6) columns at Building 8 and seven (7) columns at Building 9. See appendix A within Appendix 3: Structural Evaluation, and appendix B for typical details.

Exterior Enclosure

Exterior Walls

Brick Bearing Walls

Brick bearing walls are located at the following locations:

- South wall of Student Success Center (Bldg. 7).
- North wall of the east wing of Building 7 below the windows.

- East wall of Classroom & Labs (Bldg. 8).
- North wall of all buildings in the Student Success Center and Classroom & Labs complex (Bldgs. 7 -9) below the window walls.
- Service Building to the south of Classroom & Labs (Bldg. 9).
- Site wall south of Building 9.
- Brick shear walls added to Building 7 during the structural retrofit.

Brick bearing walls are to be preserved and maintained with the following treatments.

Spalled and Cracked Brick Treatment

Remove and replace spalled and cracked bricks within bearing and clad walls. Replacement units are to match the size, color, texture, and material properties of the original bricks.

Allow for replacement of 75 brick units.

Cracked and Deteriorated Joint Treatment

Carefully remove cracked and deteriorated mortar from joints to a depth of ¾-inch. Take care not to damage brick units. Pre-wet joints and install new Type-N mortar in two layers; color and aggregate to match the original mortar. Tool the joint profile to match original.

Allow for repointing of 5-percent of brick mortar joints.

Efflorescence Treatment

Efflorescence is present at the base of the north walls of the Classroom & Labs (Bldgs. 8 & 9); the efflorescence can extend up to approximately 3-feet.

Prior to finalizing treatment to remove the efflorescence, perform chemical and petrographic analysis to determine the type and source of efflorescence.

Visual observations indicate that the efflorescence is caused by over-irrigation and/or lack of drainage at planters and planting areas at the base of the north walls. Change to a drip irrigation system and locate lines a minimum of 5-feet away from the base of brick masonry walls.

Perform trial/sample cleaning to determine the gentlest cleaning that effectively removes the salts. If necessary and if determined by analysis results, chemically treat wall surfaces to remove efflorescence.

Treatment of Soiling and Biological Growth

Soiling and biological growth is present at a limited wall area that is not protected by overhanging eaves or canopies. Clean the wall with a mild detergent and biocide. Perform trial/sample cleaning to determine the gentlest level of cleaning that effectively removes the soiling and biological growth.

Assume 250 square feet of wall area requires cleaning and biocide treatment.

Precast Concrete Window Sills

Precast concrete window sills are located below the window wall at the north elevation of the Student Success Center and Classroom & Labs (Bldgs. 7-9). Minor soiling and cracking of mortar joints between the units are present.

Clean precast concrete sills to remove soiling. Perform test samples of mild detergent cleaners and mild acidic cleaners to determine the gentlest means to effectively clean the sills.

Monitor cracked joints to determine if cracking is due to movement related to cyclic temperature changes. If joint is experiencing movement, remove mortar to a sufficient depth and replace with non-staining elastomeric sealant and backer rod. If joint is not experiencing movement, carefully remove cracked and deteriorated mortar from joints to a depth of ¾-inch. Take care not to damage precast concrete units. Pre-wet joints and install two lifts of new Type-N mortar, color and aggregate to match the original mortar. Tool the joint profile to match original.

Concrete, Precast, Tilt-up

Precast, tilt-up concrete walls are located at the following locations:

- East and west exterior walls of the Student Success Center (Bldg. 7). Note, these walls are proposed for removal at certain alternatives.
- West exterior wall of the Classroom & Labs (Bldg. 8).
- East and west exterior wall of the Classroom & Labs (Bldg. 9).
- One interior wall at both Buildings 8 and 9.

The precast concrete walls are in good condition with no significant issues.

Stucco-Clad Wood-Frame

Stucco-clad wood-frame walls are located at the following locations:

- Connector between Building 7 and Building 8.

The stucco is in good condition and currently does not require any work.

Windows

Aluminum Window Walls

The tilted aluminum-framed window walls at the north elevation of the Student Success Center and Classroom & Labs complex (Bldgs. 7 -9) are a main character-defining feature of the complex. The window walls contain both fixed glazing and approximately 20 to 25-percent operable awning and hopper-type sashes.

Glazing Repair

Glazing putty (sealant) is deteriorated and needs replacement. Window glass is generally in good condition, although some is back-painted to obscure the interior. In concert with other window work, the following is recommended:

- Test putty material to determine if asbestos or PCBs are present and if present, remove and dispose of material in accordance with local, state, and federal regulations.
- Completely remove and dispose of outer putty. Take care not to damage glass or window frame.
- Remove and salvage existing glass. Remove any paint coatings and putty residue. Clean glass and label pieces for reinstallation in original location.
- Completely remove and dispose of bedding putty.
- Treat window frames as described below.
- Reinstall glass, bed glass in non-staining silicone sealant and install outer fillet bead of non-staining silicone sealant. Follow recommendations in the latest edition of the "*Glazing Manual*" published by the Glass Association of North America (GANA).

Window Frames Repair

The unfinished aluminum frames are exhibiting surface corrosion. A number of fasteners that connect pieces of the frames are missing. In concert with sealing and glazing work, the following is recommended:

- Protect glazing, which is to remain.
- Clean the frames with a mild detergent and water.
- Remove surface corrosion by scrubbing with a pumice powder and pads.
- Replace, in kind, missing frame-to-frame fasteners.
- Seal surface with a clear coating to limit further corrosion.

Awning and Hopper Sashes Repair

The following treatment is recommended:

- Treat frames and glazing as described above.
- Survey sash to determine damaged or missing hardware, such as hinges, delimiters, and latches. For estimating purposes assume 35-percent of hardware is missing or damaged.
- Replace damaged or missing hardware.
- Clean and lubricate hardware.
- Install neoprene weather-stripping.
- Adjust sash to assure operation.

Perimeter Seal Replacement

The perimeter seals between the window frames and masonry and concrete (sides), precast concrete sill (bottom) and wood eave (top) have reached the ends of their service life and should be replaced. The following is recommended:

- Test sealant material to determine if asbestos or PCBs are present and if present, remove and dispose of material in accordance with local, state, and federal regulations.

- Completely remove and dispose of sealant and backing materials, taking care not to damage adjacent materials.
- Prepare substrate surfaces, prime as required by sealant manufacturer.
- Install new backing material and non-staining, elastomeric sealant. Protect adjacent materials from excess sealant.

Aluminum Clerestory Windows

Aluminum clerestory windows are present at the following locations:

- South wall of the Classroom & Labs (Bldgs. 8 & 9).
- Note that original clerestory windows at the Student Success Center (Bldg. 7) may be covered-up by later modifications. Additional investigation is required.

Originally, a mix of fixed glazing and awning sash were present at the clerestory. The windows have been modified to accommodate mechanical systems and ductwork. It is recommended that the mechanical equipment and ductwork be removed and that the windows be restored to their original type and operation.

Repair (All Alternatives)

We recommend that the in-place glass be removed and replaced with a laminated glass with heat gain resistive properties (double low-e glass). Frames, sash, and perimeter seals are to be treated the same as the aluminum window walls described above.

Aluminum Windows – Fixed and Operable

Aluminum windows are present at the following locations:

- South wall of the Student Success Center (Bldg. 7).
- East wall of the Classroom & Labs (Bldg. 8).

Repair (All Alternatives)

Remove and replace all glass; remove and replace sealant; restore/adjust operations and hardware; clean, prepare, and clear-coat frames; and install safety/UV films as required.

Louvers

Aluminum louvers are located at the clerestory windows at the Classroom & Labs (Bldgs. 8 & 9).

Repair (All Alternatives)

Clean and repair existing louvers.

Exterior Sun Control

Exterior sun control exists at the patio between Buildings 8 and 9. The system consists of steel framing, including tapered steel columns and wide flange steel beams. Redwood joists are spaced equally between the steel framing to create a trellis. The end of the trellis consists of a continuous stucco soffit approximately 4-foot wide and 18-inches high.

Repair (All Alternatives)

Remove wood members and salvage any members in good condition. Remove paint from steel. Clean rust, repair damage and install new rust-inhibiting coating. Install new 3-inch x 8-inch redwood members to match existing between existing steel framing. Assume 18 new redwood members, 16 feet in length. Soffit to receive new paint coating and roof.

Exterior Doors

Solid Wood Doors

Solid wood doors are located at the south walls of the Student Success Center and Classroom & Labs (Bldgs. 7-9) as well as the east wall of the Student Success Center (Bldg. 7). Some doors have glass lights or vision panels.

Repair

Existing wood doors are in good condition. Refinish existing wood doors. Remove wood doors from frame. Repair wood frame, clean paint from existing hinges and hardware.

Remove all door hardware. Remove paint and repair damaged wood. Prepare door for new hardware. Prime and paint door. Rehang door on new hinges. Provide new ADA compliant hardware. Provide new push bar hardware at spaces over 990 square feet.

All Alternatives, Student Success Center (Bldg. 7): Repair and refinish three (3) existing wood doors.

All Alternatives, Classroom & Labs (Bldg. 8): Repair and refinish five (5) existing wood doors.

All Alternatives, Classroom & Labs (Bldg. 9): Repair and refinish seven (7) existing wood doors.

Hollow Metal Doors

There are currently hollow metal doors at mechanical spaces and at the north elevation at the east wing of the Student Success Center (Bldg. 7). The additions containing the mechanical rooms at Building 7 are proposed for removal. The hollow metal doors at the east wing of Building 7 will be replaced with new aluminum storefront doors. See Aluminum Storefront Door section below for more detail.

New hollow metal doors are required at all mechanical, electrical, service and restroom locations. New hollow metal frames are required. New hollow metal frames to be installed in existing masonry walls.

All Alternatives, Student Success Center (Bldg. 7): Assume 14 new hollow metal doors and frames at each alternative.

Aluminum Storefront Doors

Existing aluminum doors are located at the north elevations of Buildings 7, 8, and 9.

Repair

Alternatives 1A and 1B, Student Success Center (Bldg. 7): One (1) pair of aluminum storefront doors with aluminum sidelights and transom is to remain. These doors are in good condition and require only minimal service and maintenance.

Alternatives 1C and 2A, Student Success Center (Bldg. 7): Three (3) pairs of aluminum storefront doors with aluminum sidelights and transom are to remain. These doors are in good condition and require only minimal service and maintenance.

Replace

All Alternatives, Classroom & Labs (Bldg. 8): Two (2) pairs of aluminum storefront doors and one single aluminum door with aluminum sidelights and transom windows. These doors are in fair condition. Assume new aluminum storefront doors, three pairs with aluminum frames and transom glazing. Overall size of each of these three openings is approximately 8-foot wide by 12-foot high.

Upgrade

New glazed single aluminum doors are proposed to replace existing solid single hollow metal doors at the north elevation of the east wing of Building 7. Glazed storefront doors will be more compatible with the building and meet egress requirements for these spaces.

Alternatives 1A and 1B, Student Success Center (Bldg. 7): Assume two (2) new glazed aluminum single storefront doors and transom windows in existing aluminum frames.

Alternatives 1C and 2A, Student Success Center (Bldg. 7): Assume three (3) new glazed aluminum single storefront doors and transom windows in existing aluminum frames.

Alternative 2B, Student Success Center (Bldg. 7): Assume three (3) new glazed aluminum single storefront doors and transom windows in existing aluminum frames. In addition, assume creation of one additional opening in the existing wall to create an additional glazed aluminum storefront opening. Remove existing brick base and aluminum window wall as required to install new aluminum storefront system. Size of new opening is approximately 3-foot, 6-inches wide and 9-foot high.

Roofing

The Student Success Center and Classroom & Labs complex (Bldgs. 7-9) currently consist of a combination of metal and single-ply membrane roofs. The removal of non-compatible additions at the Student Success Center (Bldg. 7) includes the removal of all metal roofs to return the overall massing and form to its earlier appearance.

Main Roof – Membrane without Parapet

Remove and Replace

All Alternatives, Classroom & Labs (Bldgs. 8 & 9): Remove existing membrane roof and all underlayment down to the exterior wood roof deck. Repair damaged decking with new plywood. Assume 10%. Install new single-ply membrane roof.

Student Success Center (Bldg. 7), Assume the following for the area south of the clerestory windows at Building 7: Remove existing metal roof, boxed parapet roof, including all layers of roofing and underlayment down to wood rafters. Assume new sistered wood joists to existing rafters and install new 3/4 inch plywood sheathing. Install new single-ply membrane roof. Assume the following at low slope roofs at Building 7 from the south exterior wall to the line of original clerestory windows at the east and west wings.

Alternatives 1A and 1B, Student Success Center (Bldg. 7): Assume 3,300 gross square feet (GSF) of new roof and supplemental framing south of the clerestory windows.

Alternatives 1C and 2A, Student Success Center (Bldg. 7): Assume 4,700 GSF of new roof and supplemental framing south of the clerestory windows.

Alternative 2B, Student Success Center (Bldg. 7): Assume 3,700 GSF of new roof and framing south of the clerestory windows.

Student Success Center (Bldg. 7), Assume the following for the area north of the clerestory windows at Building 7: Remove existing membrane roof and all underlayment down to the exterior roof sheathing. Repair damaged sheathing. Assume 5%. Install new single-ply membrane roof.

Alternatives 1A and 1B, Student Success Center (Bldg. 7): Assume 4,640 GSF of re-roofing north of the clerestory windows.

Alternatives 1C and 2A, Student Success Center (Bldg. 7): Assume 7,456 GSF of re-roofing north of the clerestory windows.

Alternative 2B, Student Success Center (Bldg. 7): Assume 5,408 GSF of re-roofing north of the clerestory windows.

Flashing and Trim

All three buildings at the Student Success Center and Classroom & Labs complex (Bldgs. 7-9) have metal drip edges at the termination of low-slope roofs. Replace existing metal drip edge with new painted galvanized meal drip edge.

Main Roof – Membrane with Parapet

The brick masonry service building to the south of the Classroom & Labs Building 9 (Bldg. 9b) includes a low slope roof surrounded by parapet walls. Assume removal of all existing rooftop mounted equipment, removal of existing roof membrane and all underlayment down to wood deck. Assume replacement of 10% of deck. Install new low slope membrane roof. Provide new reglet and counter-flashing at parapet walls to receive roof membrane. Remove paint from existing sheet metal parapet cap and provide new painted finish.

Roof at Covered Walkways

Remove existing equipment from exterior walkway roofs. Remove existing membrane roof and all underlayment down to the exterior roof decking. Repair damaged deck. Assume 25%. Provide new metal drip edge at edge of canopy roof.

New Gutters and Downspouts

Remove existing gutters and downspouts and install new galvanized sheet metal gutters and downspouts.

Repair and Refinish Eaves and Soffits

Remove paint from existing wood soffits. Repair damaged wood. Assume 10%. Prime and paint soffits.

Skylights

Modify existing framing to provide new skylights at exterior walkway canopy at the Classroom & Labs (Bldgs. 8 & 9). Assume 10 locations.

Interiors

Interiors will be fully modernized to meet the flexible needs of the campus community now and into the future. The interiors will be rehabilitated to provide comfortable spaces for a variety of functions.

The existing spaces are simply designed with clean lines and durable, low-maintenance materials. New finishes at administration, student and community spaces will be compatible with the original design. New finishes include carpet tiles, rubber base, paint, ceiling tiles and window treatments.

Original surface-mounted ceiling tiles will remain where feasible. Additional testing to determine if the tiles are an asbestos-containing material (ACM) is required. If replacement tiles are required, they should match the original tiles in size, color and texture. Selected ceilings may need to be lowered to accommodate new HVAC equipment. See HVAC section below for more information.

Manual window shades will be provided at the north window walls while motorized window shades will control daylight at the south-facing clerestory windows.

The original design of the classroom buildings incorporated many sustainable design principles including passive daylighting and natural ventilation. While the buildings will be retrofitted with new heating and ventilation systems, there are numerous opportunities to showcase the sustainable features of these buildings.

To improve their performance, additional study and energy modeling is recommended to fully understand the performance of the buildings over the course of a day and throughout the year. Clerestory glazing may be retrofitted with special performance glazing, like low-e, that reflects long-wave, or heat-generating, infrared waves while still allowing visible light to enter the building.

Mechanical, Electrical, and Plumbing (MEP)

Heating, Ventilation and Air-Conditioning (HVAC)

The current mechanical system relies on rooftop units placed on the covered walkways with supply air ducts compromising the clerestory windows. The current design is unattractive and has caused some structural damage to the covered walkways that were not designed to carry the weight of these units.

Rehabilitation will include a new heating and ventilation system integrated with the spatial character of the interior. Preliminary design concepts include two options:

Option 1

A four-pipe system that uses hot and cold water loops to provide heating and air-conditioning. The four-pipe system includes a central plant with a chiller and boiler sized to provide hot and cold water to the Student Success Center and Classroom & Labs complex (Bldgs. 7-9), Business Education complex (Bldgs. 12-14), and Math and Planetarium complex (Bldgs. 35-39). The central plant will be discretely located to blend in with the campus landscape with screen walls and a roof. At the interiors, the hot and cold water loops will terminate in either fan coils or chilled beam and ceiling panels. The fan coils may require dropping a portion of the ceiling to accommodate the unit. Chilled beams or ceiling panels provide a more efficient system that could be left exposed at the interior of the spaces. Four-pipe hydronic system require a greater up-front cost, but the systems operate more efficiently and have a greater life expectancy than the variable refrigerant system.

Option 2

The second option includes a variable refrigerant system (VRF) that moves refrigerant through a closed loop to provide heating and cooling. The VRF system includes ground-mounted heat pumps located outside the building. The outdoor units contain a compact footprint that can be integrated with screen walls located adjacent to the building. VRF systems allow for a single outdoor unit to serve multiple zones of a building, making them a good choice for multi-purpose buildings. A VRF system is a good choice for the classroom buildings because it requires only small-diameter pipes for moving refrigerant rather than large ducts that could be intrusive to the original spatial design. The refrigerant pipes connect with special compact fan coil units that could be located at ceilings or at the base of the window walls.

Electrical

The electrical system will be completely upgraded. Components beyond their useful service life, including transformers, main service panels and secondary distribution panels, will be replaced. Upgrade of the interior will include new lighting and power circuits.

Plumbing

Existing restroom spaces will be expanded and completely remodeled as part of the building rehabilitations. To make the reuse of existing water and waste lines possible, renovated restrooms will be located in current locations. Renovation of the restroom facilities will include removal and replacement of concrete floor slabs to provide easier tie-in of new fixtures with existing plumbing. Restrooms will be provided with new fixtures and accessories. Ceramic tile floor and wall tile is included.

Fire Sprinklers

Wet-pipe fire sprinkler system will be added to the classroom buildings to protect the buildings and occupants in the event of a fire. The sprinkler mains will be located in service rooms with the distribution piping and sprinkler heads left exposed in the spaces.

Communications and Security

Audio-visual equipment and wireless communications equipment will be installed to provide a 21st Century campus environment. New rooms with intermediate distribution frames (IDF) are provided at each complex.

A security system will be integrated with the overall campus security system to control access to the buildings and provide oversight of the campus environs. A security system could include closed-circuit cameras to monitor activity in and around the buildings. A comprehensive assessment of campus security was not part of this Historic Structures Report.

Site Work

Outdoor Spaces

Outdoor Patio between Classroom & Labs Buildings 8 and 9

There are a number of opportunities to revitalize and reimagine the outdoor spaces connecting the Student Success Center and Classroom & Labs complex (Bldgs. 7-9). The outdoor patio between Buildings 8 and 9 will be rehabilitated to provide flexible outdoor space. A small food service facility will be introduced adjacent to this space. New planting and furniture will be added to create a node for activity at the center of the campus.

Landscaped Plaza between the Student Success Center (Bldg. 7) and Classroom & Labs Building 8

The landscaped plaza between Buildings 7 and 8 will become the focal point for the complex, welcoming visitors to the campus' oldest remaining building. The plaza will be rehabilitated to provide more shade and seating areas. At various alternatives, hardscape may be extended to the south and west to create more generous location for outdoor activities and events.

Buildings 12, 13, 14 | Business Education Complex

Under all of the proposed preservation alternatives, the Business Education complex (Buildings 12, 13, and portions of 14) are recommended to be adaptively re-used in accordance with *the Rehabilitation Standards*. All of the preservation alternatives recommend removal of the ca. 1977 addition to Building 14. The three reuse options are as follows:

Alternatives 1A and 1B:	Alternatives 1A and 1B adaptively reuse the complex for the campus' Special Services and Honors Programs.
Alternative 1C:	Alternative 1C adaptively reuses the complex for Student and Community Functions.
Alternatives 2A and 2B:	Alternatives 2A and 2B adaptively reuse the complex as an Interdisciplinary Center.

Schematic drawings and diagrams illustrating treatment recommendations for the complex are included in Appendix 1.

Figure 2: Business Education complex (Bldgs. 12-14).

Selective Demolition

Selective demolition is essentially the same for the various preservation alternatives and is described as follows. Note that removal and replacement of individual items may be described later under the specific system.

Removal of Inappropriate Additions and Alterations

Building 14 Addition

Remove and disposed of the ca. 1977 addition, including the concrete slab on grade and footings. Fill and grade the site. Preserve and temporarily shore the remaining exterior brick walls from the original construction to the north, east, and west.

Heating, Ventilation and Air-Conditioning (HVAC)

Remove HVAC units and associated ductwork, piping, curbs, and supports from canopy roofs. Remove registers and non-glass panels from clerestory windows to south of Buildings 12 and 13.

Concrete

Remove and replace the concrete floor slab at restroom locations to allow for installation of new plumbing fixtures.

Interiors

Preserve and protect existing finished wood veneer plywood wainscot and cabinetry at northern walls. Preserve and protect finished wood veneer plywood clad closets.

Removal of Hazardous Materials

A limited survey and sampling of asbestos containing materials (ACM) was completed in 2005. A visual survey was completed as part of the Historic Structures Report in January 2015. This recent survey identified additional potential hazardous materials including ACMs, lead based paint (LBP), mercury, polychlorinated biphenyls (PCB) and miscellaneous materials.

Asbestos: The 2005 survey identified window putty, leveling compound, linoleum flooring, vinyl floor tile and transite pipe as being ACMs. A visual survey and assessment completed as part of the Historic Structures Report in January 2015 determined that additional ACMs may be present. Amongst those materials suspected of being ACMs are acoustic ceiling tile, vinyl base and carpet mastic, insulation, grout, exterior expansion joints, counter top and sheet flooring. The complete list is contained in Appendix 6: Hazardous Materials Visual Assessment Report.

Lead: The January 2015 visual survey identified several items that potentially contain lead paint including, but not limited to, painted door and window systems, exterior painted walls, ceramic tile and roof systems. For more detail see Appendix 6: Hazardous Materials Visual Assessment Report.

PCB: The January 2015 visual survey identified potential polychlorinated biphenyls (PCBs) in the ballast at fluorescent fixtures, concrete expansion joint caulking and window putty.

Other: Mercury was identified in the fluorescent light bulbs.

Structural

As described in Section 1B of this report (Chronology of Development and Use), the complex was seismically upgraded in the late 1990s. While the retrofits are generally not consistent with *the Standards*, reversing them is not cost effective and would likely cause more damage than simply keeping them in place.

Foundations

Buildings 12 and 13, as well as the original portions of Buildings 14, sit atop grade beams that are supported upon caissons. Floors are concrete slabs on grade.

Work to the foundations associated with the preservation alternatives includes removal and replacement of the slab on grade at restroom locations to facilitate new plumbing and fixture layouts. Additional work includes coring of grade beams and coring and/or cutting slabs to facilitate installation of cold and hot water piping associated with a new HVAC system.

Gravity Load Systems

Roof Framing

Building 14: Removal of the 1970s addition to Building 14 will require installation of new wood roof framing and structural plywood decking. The structural system should slope to through-wall scuppers along the west elevation.

Wall Framing

Building 14: An approximately 28-foot 6-inch long by 13-foot tall section of exterior wall to the west of the original Building 14 will need to be reconstructed following removal of the 1970s addition. The new section of wall may be framed of light-gage steel or wood framing and will require a header for an approximately 25-foot wide opening.

Lateral Load Systems

Shear Walls

No work required.

Supplemental Framing

Add new moment frame at the south wall of Building 14.

Diaphragms

Not required.

Enhanced Connections

Brick masonry walls to wood diaphragm roof anchorage is non-compliant at Building 14.

Wall-to-Roof

Provide wall anchors at 4-foot on-center max spacing. See Appendix B within Appendix 3 for typical anchorage details.

Exterior Enclosure

Exterior Walls

Brick Bearing Walls

Brick bearing walls are located at the following locations:

- North wall of Buildings 12 and 13. These walls were retrofitted with oversized steel tube columns in the 1990s. The tube columns are to remain.
- East and west walls of Buildings 12 and 13.
- East end of north wall of Building 13.
- Original construction to the north, east, and west of Building 14.

Brick Clad Wood-Framed Walls

Brick-clad, wood-framed walls are present below the window walls at the north elevations of Buildings 12 and 13.

Brick bearing and clad walls are to be preserved and maintained with the following treatments.

Spalled and Cracked Brick Treatment

Remove and replace spalled and cracked brick within bearing and clad walls. Replacement units are to match the size, color, texture, and material properties of the original bricks – note that the brick units are a special size ("utility" sized bricks, 2-7/8 inches square x 11-3/4 inches).

Allow for replacement of 100 brick units.

Cracked and Deteriorated Joint Treatment

Carefully remove cracked and deteriorated mortar from joints to a depth of ¾-inch. Take care not to damage brick units. Pre-wet joints and install new Type-N mortar in two layers; color and aggregate to match the original mortar. Tool the joint profile to match original.

Allow for repointing of 5-percent of brick mortar joints.

Efflorescence Treatment

Efflorescence is common at the base of the north walls of Buildings 12 and 13; the efflorescence can extend up to approximately 3-feet.

Prior to finalizing treatment to remove the efflorescence, perform chemical and petrographic analysis to determine the type and source of efflorescence.

Visual observations indicate that the efflorescence is caused by over-irrigation and/or lack of drainage at planters and planting areas at the base of the north walls. Change to a drip irrigation system and locate lines a minimum of 5-feet away from the base of brick masonry walls.

Perform trial/sample cleaning to determine the gentlest cleaning that effectively removes the salts. If necessary and if determined by analysis results, chemically treat wall surfaces to remove efflorescence.

Treatment of Soiling and Biological Growth

Soiling and biological growth is present at a limited wall area that is not protected by overhanging eaves or canopies. Clean the wall with a mild detergent and biocide. Perform trial/sample cleaning to determine the gentlest level of cleaning that effectively removes the soiling and biological growth.

Assume 200 square feet of wall area requires cleaning and biocide treatment.

Brick Wing-Walls

Brick wing-walls are located to the south of Building 12; the walls consist of two wythes of brick separated by a steel-reinforced grouted core. The walls support the southern edge of the canopy to the south of Building 12.

Spalled and Cracked Brick Treatment

An unusually large percent of the bricks within the wing-walls are experiencing spalling of the fired face of individual brick units. Visual inspection suggests that the deterioration is related to problems with the original manufacture of the brick. Spalling failure may be exacerbated by crypto-florescence, the formation of crystals within the body of the brick. Laboratory (petrographic) analysis is recommended to determine the cause of the deterioration prior to finalizing treatment. Additionally, we recommend testing of the in-place mortar, which may be too hard and also contributing to the deterioration of the brick.

Remove and replace face-spalled and cracked brick within bearing and clad walls. Replacement units are to match the size, color, texture, and materials properties of the original bricks. Again note that the brick units are a special size. Mortar used to set and point replaced brick units should be softer than the brick units (Type N or O) and match the color, aggregate, and tooling of the original mortar.

Assume 20-percent of brick units at the wing-walls require replacement.

Efflorescence Treatment

Efflorescence occurs sporadically across the full height of the wing-walls.

Prior to finalizing treatment to remove the efflorescence, perform chemical and petrographic analysis to determine the type and source of efflorescence.

Visual observations indicate that the efflorescence is caused by over-irrigation and/or lack of drainage at planters and planting areas at the base of the north walls. Change to a drip irrigation system and locate lines a minimum of 5-feet away from the base of brick masonry walls.

Perform trial/sample cleaning to determine the gentlest cleaning that effectively removes the salts. If necessary and if determined by analysis results, chemically treat all of the wing-wall brick surfaces to remove efflorescence.

Brick Clad, Wood-Frame Shear Walls

Brick clad concrete shear walls were installed in the 1990s. While the shear walls have affected the appearance of the building, most notably reducing the amount of window wall to the north elevations of Buildings 12 and 13, to remove them would be more disruptive than to leave them in place and maintain them.

At this time, no work is proposed at the clad shear walls.

Precast Concrete Window Sills

Precast concrete window sills are located below the window wall at the north elevation of Buildings 12 and 13. Minor soiling and cracking of mortar joints between the units are present.

Clean precast concrete sills to remove soiling. Perform test samples of mild detergent cleaners and mild acidic cleaners to determine the gentlest means to effectively clean the sills.

Monitor cracked joints to determine if cracking is due to movement related to cyclic temperature changes. If joint is experiencing movement, remove mortar to a sufficient depth and replace with non-staining elastomeric sealant and backer rod. If joint is not experiencing movement, carefully remove cracked and deteriorated mortar from joints to a depth of ¾-inch. Take care not to damage precast concrete units. Pre-wet joints and install two lifts of new Type-N mortar, color and aggregate to match the original mortar. Tool the joint profile to match original.

Stucco-Clad Wood-Frame

As described in the Structural section above, a portion of the exterior wall to the west of the original Building 14 will need to be reconstructed following removal of the 1970s addition. The lower section of the wall will hold bi-fold doors (described below) the upper section of the wall will be clad in new cement-plaster stucco to match the original. For cost estimating purposes, assume a 28 foot 6 inch long by 6 foot tall section of new 3-coat stucco with an integral finish coat.

Windows

Aluminum Window Walls

The tilted aluminum-framed window walls at the north elevation of Buildings 12 and 13 are a main character-defining feature of the complex. The window walls contain both fixed glazing and approximately 20 to 25-percent operable awning-type sash.

Glazing

Glazing putty (sealant) is deteriorated and needs replacement. Window glass is generally in good condition, although some is back-painted to obscure the interior. In concert with other window work, the following is recommended:

- Test putty material to determine if asbestos or PCBs are present and if present, remove and dispose of material in accordance with local, state, and federal regulations.
- Completely remove and dispose of outer putty. Take care not to damage glass or window frame.
- Remove and salvage existing glass. Remove any paint coatings and putty residue. Clean glass and label pieces for reinstallation in original location.
- Completely remove and dispose of bedding putty.
- Treat window frames as described below.
- Reinstall glass, bed glass in non-staining silicone sealant and install outer fillet bead of non-staining silicone sealant. Follow recommendations in the latest edition of the "*Glazing Manual*" published by the Glass Association of North America (GANA).

Window Frames

The unfinished aluminum frames are exhibiting surface corrosion. A number of fasteners that connect pieces of the frames are missing. In concert with sealing and glazing work, the following is recommended:

- Protect glazing, which is to remain.
- Clean the frames with a mild detergent and water.
- Remove surface corrosion by scrubbing with a pumice powder and pads.
- Replace, in kind, missing frame-to-frame fasteners.
- Seal surface with a clear coating to limit further corrosion.

Awning Sash

The following treatment is recommended:

- Treat frames and glazing as described above.
- Survey sash to determine damaged or missing hardware, such as hinges, delimiters, and latches. For estimating purposes assume 35-percent of hardware is missing or damaged.
- Replace damaged or missing hardware.
- Clean and lubricate hardware.
- Install neoprene compression-type weather stripping at sash perimeter.
- Adjust sash to assure operation.

Perimeter Seal

The perimeter seals between the window frames and brick (sides), precast concrete sill (bottom) and wood eave (top) have reached the ends of their service life and should be replaced. The following is recommended:

- Test sealant material to determine if asbestos or PCBs are present and if present, remove and dispose of material in accordance with local, state, and federal regulations.
- Completely remove and dispose of sealant and backing materials, taking care not to damage adjacent materials.
- Prepare substrate surfaces, prime as required by sealant manufacturer.
- Install new backing material and non-staining, elastomeric sealant. Protect adjacent materials from excess sealant.

Aluminum Clerestory Windows

Aluminum-framed clerestory windows are present above walkway canopies along the south elevations of Buildings 12 and 13. Originally, a mix of fixed glazing and awning sash were present at the clerestory. The windows have been modified to accommodate mechanical systems and ductwork. It is recommended that the mechanical equipment and ductwork be removed and that the windows be restored to their original type and operation.

We recommend that the in-place glass be removed and replaced with a laminated glass with heat-gain resistive properties (double low-e glass). Frames, sash, and perimeter seals are to be treated the same as the window walls described above.

Louvers

Aluminum louvers are located at the clerestory windows at Buildings 12 and 13.

Repair (All Alternatives)

Clean and repair existing louvers.

Store Front

Building 13: A wood-framed storefront is present at the east elevation of Building 13, within the breezeway between Buildings 12 and 13. Follow the *Rehabilitation Guidelines* for “Building Exterior, Storefronts, Protecting and Maintaining”.

Building 14: As part of the rehabilitation of Building 14, remove existing wood clad wall and glazed door and restore aluminum-framed display window and recessed storefront entry per historic records.

Exterior Doors

Two basic types of original exterior doors still exist within the complex.

Type 1 – Half-Glazed Wood Doors: Classrooms are typically entered through painted wood doors with a glazed upper panel set into a wood frame. Transoms with painted plywood are typically present between the head of the doors and the underside of the southern canopy.

Type 2 – Flush Wood Doors: Flush wood doors are currently present at restrooms, at the north elevation of Building 14 (into an electrical room) and within the storefront entry at the east end of Building 13. Originally, south elevation of Building 14 also had a flush wood door entry.

For both types of doors, original door knobs have been typically replaced with lever handles and the glass does not appear original. Doors are typically 3-feet wide, meeting disabled access requirements.

Existing Doors

Regardless of the door type, the doors should be retained and repaired/upgraded to achieve consistent appearance and function.

Treatment for Deteriorated Door Bottoms

Deterioration of the base of wood doors is consistent with long-term exposure to wet-dry cycles. Because the doors are protected by a canopy, the likely cause is pressure washing as a cleaning and maintenance item. We recommend limiting exposure of the doors to pressurized water streams.

To repair the base of the doors, we recommend
- Removing the existing paint coatings.
- Removing any severely decayed wood material.
- Consolidating the wood surfaces with penetrating epoxy consolidants.
- Filling-in missing material with epoxy wood patch materials.
- Sanding the surface smooth.
- Preparing, priming, and painting the doors (entire door).

Once the bottoms of the doors are repaired, we recommend installing an aluminum bottom “shoe” and sweep-type weather-strip to help reduce exposure of the door base to water.

All door bottoms require this repair.

Treatment for Hardware

Coordinate door hardware repairs with the Facilities and Operations Department and Campus Security.

Latches and Locksets: While the latches and locksets are not original, they appear to be in fair-to-good condition and in general conformance with disabled access standards. Replacement of the latches and locksets will likely be more disruptive that repairing the existing. We recommend tightening and adjusting the existing, non-original latches and locksets, replacing cylinder as required.

Hinges: The majority of doors retain their “bullet” style hinges. Where hinges remain, retain hinges; remove paint; restore original metallic finish; and lubricate. At other locations, remove non-original hinges, patch wood, and install new bullet-style hinges to match original. Assume 12 doors have original hinges and 6 doors need replacement hinges.

Door Closers: Retrofit all doors to receive new concealed door closers. Equip doors with floor mounted stop bumpers and hooks to hold open when desired.

Weather Stripping: Retrofit door frames to receive compression-type weather stripping.

Thresholds: Existing thresholds to remain.

New Doors at Building 14

In all of our preservation alternatives, Building 14 is being returned to its original footprint. This requires several new exterior doors as follows:

Flush Door at South Elevation

Cut new opening in existing brick wall and install a new wood flush door (3 feet wide by 7 feet tall) and wood frame at the south elevation. Door to match original and include hardware described above.

Entrance Door at East Elevation

As noted under the storefront section, remove existing wood clad wall and glazed door and restore original aluminum-framed display window and recessed storefront, including an aluminum-framed glazed door per historic photographs and original construction documents.

Bi-fold Door at West Elevation

The south end of the west elevation originally contained a ribbon of windows screened by vertical louvers. To make the proposed space more flexible, in lieu of restoration of the ribbon windows and screen, we recommend installing aluminum-framed, glazed, bi-fold doors (similar to NanaWall) within the same opening that originally held the windows (assume 24 feet wide by 7 feet tall).

Roofing

Main Roof

Replace Membrane

A single-ply membrane roof is currently present; it was reportedly installed in the late 1990s. It is unknown if other roof membranes are present below. The original drawings show 1 x 6 inch diagonal sheathing as a substrate, the diagonal sheathing was covered with plywood in a seismic retrofit in the late 1990s.

Given the age of the current roof and the amount of rehabilitation work proposed, we recommend replacement of the roofing membrane. Remove the existing roofing and any underlying materials down to the plywood sheathing. Install a new Type X gypsum substrate board. Install a new single-ply roofing membrane with a Solar Reflectance Index meeting the latest LEED requirements.

Replace and Repair Flashing and Trim

Remove existing and install new flashing and trim at Buildings 12 and 13. Gravel stops / drip edges at the eaves and rakes are to match the original profiles, color, and finish. Note that the sheet metal forms the fascia for the eave edges. Similarly, at Building 14, coping caps are to match the original profiles, color, and finish.

Replace and Repair Eaves and Soffits

Projecting eaves with soffits are present to the north and south of Buildings 12 and 13. The exposed eave fascia is sheet metal and the underside of the eaves is painted tongue and groove wood sheathing, which is original to the buildings. As part of the roof work, remove and replace the sheet metal fascia, match the original profile, color, and finish. Replace deteriorated wood at the underside of eaves in-kind (assume 5-percent). Prepare, prime, and paint to match original color and finish.

Preservation and Repair of Canopy Roofs

Walkway canopies are present to the south of Buildings 12 and 13. Additionally, a canopy is present to the east of Building 14 and extends north to connect to the breezeway between Buildings 12 and 13. The canopies are constructed differently. Scope of work assumes preservation and repair of canopy roof character-defining features.

Modify Skylights

Modify existing framing to provide new skylights at exterior walkway canopy at Buildings 12 and 13. Assume 9 locations.

Interiors

Interiors will be fully modernized to meet the flexible needs of the campus community now and into the future. The interiors will be rehabilitated to provide comfortable spaces for a variety of functions.

The existing spaces are simply designed with clean lines and durable, low-maintenance materials. New finishes at administration, student and community spaces will be compatible with the original design. New finishes include carpet tiles, rubber base, paint, ceiling tiles and window treatments.

Original surface-mounted ceiling tiles will remain where feasible. Additional testing to determine if the tiles are an asbestos-containing material (ACM) is required. If replacement tiles are required, they should match the original tiles in size, color and texture. Selected ceilings may need to be lowered to accommodate new HVAC equipment. See HVAC section below for more information.

Manual window shades will be provided at the north window walls while motorized window shades will control daylight at the south-facing clerestory windows.

The original design of the classroom buildings incorporated many sustainable design principles including passive daylighting and natural ventilation. While the buildings will be retrofitted with new heating and ventilation systems, there are numerous opportunities to showcase the sustainable features of these buildings.

To improve their performance, additional study and energy modeling is recommended to fully understand the performance of the buildings over the course of a day and throughout the year. Clerestory glazing may be retrofitted with special performance glazing, like low-e, that reflects long-wave, or heat-generating, infrared waves while still allowing visible light to enter the building.

Mechanical, Electrical, and Plumbing (MEP)

Heating, Ventilation and Air-Conditioning

The current mechanical system relies on rooftop units placed on the covered walkways with supply air ducts compromising the clerestory windows. The current design is both unattractive and has caused some structural damage to the covered walkways that were not designed to carry the weight of these units.

Rehabilitation will include a new heating and ventilation system integrated with the spatial character of the interior. Preliminary design concepts include two primary options:

Option 1

A four-pipe system that uses hot and cold water loops to provide heating and air-conditioning. The four-pipe system includes a central plant with a chiller and boiler sized to provide hot and cold water to the Student Success Center and Classroom & Labs complex (Bldgs. 7-9), Business Education complex (Bldgs. 12-14), and Math and Planetarium complex (Bldgs. 35-39). The central plant will be discretely located to blend in with the campus landscape with screen walls and a roof. At the interiors, the hot and cold water loops will terminate in either fan coils or chilled beam and ceiling panels. The fan coils may require dropping a portion of the ceiling to accommodate the unit. Chilled beams or ceiling panels provide a more efficient system that could be left exposed at the interior of the spaces. Four-pipe hydronic systems require a greater up-front cost, but the systems operate more efficiently and have a greater life expectancy than the variable refrigerant system.

Option 2

The second option includes a variable refrigerant system (VRF) that moves refrigerant through a closed loop to provide heating and cooling. The VRF system includes ground-mounted heat pumps located outside the building. The outdoor units contain a compact footprint that can be integrated with screen walls located adjacent to the building. VRF systems allow for a single outdoor unit to serve multiple zones of a building, making them a good choice for multi-purpose buildings. A VRF system is a good choice for the classroom buildings because it requires only small-diameter pipes for moving refrigerant rather than large ducts that could be intrusive to the original spatial design. The refrigerant pipes connect with special compact fan coil units that could be located at ceilings or at the base of the window walls.

Electrical

The electrical system will be completely upgraded. Components beyond their useful service life, including transformers, main service panels and secondary distribution panels, will be replaced. Upgrade of the interior will include new lighting and power circuits.

Plumbing

Existing restroom spaces will be expanded and completely remodeled as part of the building rehabilitations. To make the reuse of existing water and waste lines possible, renovated restrooms will be located in current locations. Renovation of the restroom facilities will include removal and replacement of concrete floor slabs to provide easier tie-in of new fixtures with existing plumbing. Restrooms will be provided with new fixtures and accessories. Ceramic tile floor and wall tile is included.

Fire Sprinklers

Wet-pipe fire sprinkler system will be added to the classroom buildings to protect the buildings and occupants in the event of a fire. The sprinkler mains will be located in service rooms with the distribution piping and sprinkler heads left exposed in the spaces.

Communications and Security

Audio-visual equipment and wireless communications equipment will be installed to provide a 21st Century campus environment. New rooms with intermediate distribution frames (IDF) are provided at each complex.

A security system will be integrated with the overall campus security system to control access to the buildings and provide oversight of the campus environs. A security system could include closed-circuit cameras to monitor activity in and around the buildings. A comprehensive assessment of campus security was not part of this Historic Structures Report.

Site Work

Outdoor Spaces

Outdoor Plaza West of Building 14

A significant opportunity for a signature outdoor campus space is possible with the removal of the 1970s addition to Building 14. The plaza is conceived as both a central campus node and connective tissue between the Business Education complex (Bldgs. 12-14) and Math and Planetarium complex (Bldgs. 35-39). Programming at Building 14 will be able to take advantage of this outdoor space for receptions and special campus events. The plaza will provide multi-functional space that can be set-up with chairs for performances or tables and chairs for receptions. Landscape will include new shade trees and plantings.

Buildings 2, 4 | Theater and Music Complex

The Theater and Music complex is comprised of a number of different buildings constructed from the mid-1950s to the 2000s. The Historic Structures Report focuses on the earliest buildings in the complex, the Robert B. Moore Theater (Bldg. 2) and Music Building (Bldg. 4). The Theater and Music complex is proposed for continued use as part of the Arts Programs on campus. Both the Theater and Music Buildings have undergone a number of additions and renovations over time. The preservation treatments outlined below include only important character-defining features and historic interior elements.

Both Buildings 2 and 4 are in good overall condition and there are very few items requiring immediate attention. There are a number of structural items that require mitigation. Items that should be addressed within 3-5 years include upgrades to HVAC and electrical systems as well as preservation of architectural elements.

Figure 3: Theater and Music complex (Bldgs. 2 and 4).

Selective Demolition

Removal of Inappropriate Additions

No removal of inappropriate additions is proposed.

Removal of Hazardous Materials

The Theater and Music Buildings (Bldgs. 2 & 4) were excluded from a limited survey of asbestos containing materials (ACMs) completed in 2005. However, they were included in a visual survey completed as part of this Historic Structures Report in January 2015. This recent survey identified potentially hazardous materials including ACMs, lead based paint (LBP), mercury, polychlorinated biphenyls (PCB) and miscellaneous materials. The preservation treatment approach for Buildings

2 and 4 will have minimal impact on hazardous materials. Impacts to specific materials and systems are noted in the narrative below.

Structural

Foundations

Remove and replace concrete slab at covered walkway at north end of Theater (Bldg. 2). The slab has numerous large cracks that appear to be due to settling and movement. Area is approximately 3,000 square feet. Score pattern and finish to match historic layout. Assume new 4” reinforced slab and turn-down edge at north.

Gravity Load Systems

Bearing Walls

No work is required.

Posts / Columns

No work is required.

Roof

No work is required.

Lateral Load Systems

New Shear Walls

No work is required.

Supplemental Framing

No work is required.

Diaphragms

Cross Ties

Wood diaphragm cross ties are not present at Buildings 2 and 4.

Provide new wood diaphragm cross ties at 24 feet on-center max spacing per appendices A and B within the Structural Evaluation Appendix of this report (Appendix 3).

Assume 13 locations at Building 2.

Assume 15 locations at Building 4.

Collectors / Drags

Collectors not present at Building 4.

Assume 2 locations per appendix A within the Structural Evaluation Appendix of this report (Appendix 3).

Enhanced Connections

Pile Cap

No top reinforcing steel in pile cap. Retrofit of condition will be required based on engineering analysis.

Assume two locations at the southeast and southwest corners of the curved concrete walls at the Theater.

Wall-to-Roof

Cast-in-place concrete and masonry to wood diaphragm roof anchorage is non-compliant.

Provide wall anchors at 4-foot on-center max spacing per locations shown in appendix A within Appendix 3 of this report and appendix B for typical anchorage details.

Length of wall requiring new anchors is approximately 700 linear feet (LF) at the Theater Building (Bldg. 2).

Length of wall requiring new anchors is approximately 500 LF at the Music Building (Bldg. 4).

Wall-to-Wall

No work is required.

Exterior Enclosure

Exterior Walls

Brick Bearing Walls

Brick bearing walls are located at the following locations:

- Ticket Office at the northeast corner of the Theater (referred to as Building 2b). Note there is a later stucco-clad addition to the north of the original box office.
- One story brick wing at west side of the Theater.
- Portions of the east and west elevation of the Music Building (Bldg. 4). Other areas of masonry wall are stucco-clad.

Note that brick site and retaining walls are covered under Site Work.

Brick bearing walls are to be preserved and maintained with the following treatments.

Spalled and Cracked Brick Treatment

A number of the bricks at the west elevation of the Music Building (Bldg. 4) are experiencing spalling of the fired face of individual brick units. Visual inspection suggests that the deterioration is related to problems with the original manufacture of the brick. Spalling failure may be exacerbated by crypto-florescence, the formation of crystals within the body of the brick. Laboratory (petrographic) analysis is recommended to determine the cause of the deterioration prior to finalizing treatment. Additionally, we recommend testing of the in-place mortar, which may be too hard and also contributing to the deterioration of the brick.

Remove and replace face-spalled and cracked bricks within bearing and clad walls. Replacement units are to match the size, color, texture, and material properties of the original bricks. Note that the brick units are a special size. Mortar used to set and point replaced brick units should be softer than the brick units (Type N or O) and match the color, aggregate, and tooling of the original mortar.

Assume 10 percent of approximately 450 square feet of wall area that requires replacement at the west elevation of Building 4.

Cracked and Deteriorated Joint Treatment

The bond at the brick-mortar interface is poor in a few isolated locations on the east façade of the Ticket Office (Bldg. 2b) and west façade of the Music Building (Bldg. 4).

Carefully remove cracked and deteriorated mortar from joints to a depth of ¾-inch. Take care not to damage brick units. Pre-wet joints and install new Type-N mortar in two layers; color and aggregate to match the original mortar. Tool the joint profile to match original.

Assume 10 percent of 800 square feet of brick wall at the east façade of the Ticket Office and west facade of Building 4.

Efflorescence Treatment

Efflorescence is common at the base of the Ticket Office and its one-story addition to the west of Building 2 (Bldg. 2b). Prior to finalizing treatment to remove the efflorescence, perform chemical and petrographic analysis to determine the type and source of efflorescence.

Visual observations indicate that the efflorescence may be caused by over-irrigation and/or lack of drainage at planters and planting areas. Change to a drip irrigation system and locate lines a minimum of 5-feet away from the base of brick masonry walls.

Perform trial/sample cleaning to determine the gentlest cleaning that effectively removes the salts. If necessary and if determined by analysis results, chemically treat wall surfaces to remove efflorescence.

Assume 400 square feet of efflorescence treatment at Buildings 2 and 4.

Treatment of Soiling and Biological Growth

Soiling and biological growth is present at a limited wall area that is not protected by overhanging eaves or canopies. There is also soiling at some walls from water running off walls and overhangs. Clean the wall with a mild detergent and biocide. Perform trial/sample cleaning to determine the gentlest level of cleaning that effectively removes the soiling and biological growth.

Assume 500 square feet of wall area requires cleaning and biocide treatment.

Poured-in-Place Concrete

Poured-in-place concrete walls are prevalent at the Theater (Bldg. 2), including the plectrum-shaped Auditorium, Stage House and Drama Workshop. The walls appear to be in good condition with no significant deterioration.

Crack Repair

There are a few small hairline cracks that require repair. Small cracks are to receive epoxy injection. Prior to epoxy injection, remove paint surrounding the crack and clean and prepare the crack. Reinstate texture of wall surrounding crack to match existing and paint to match.

Assume 20 linear feet of concrete crack repair.

The concrete walls at the Theater (Bldg. 2) do not currently require new paint. Future investigation of the paint finish through paint adhesion tests and additional investigation should be completed to determine if the original finish was textured. Include additional paint investigation, mock-up and new paint finish in the short term cost.

Stucco-Clad Wood-Frame Walls

Stucco-clad wood-frame walls are located at the Music Building (Bldg. 4). The walls are in good condition, having recently been a part of the renovation of the Music Building. No work is required at this time.

Wood-Clad Wood-Frame Walls

The north elevation of the Theater features a curved wood clad wall with flush doors. The wall is in good condition and does not currently require any repair or maintenance.

In the future, an investigation of the finish should be undertaken to determine the original finish of this wall. Paint analysis may reveal underlying colors or finishes that could inform the long-term preservation of the Theater.

Windows

There are a limited number of windows at the Theater Building (Bldg. 2) and no windows at the Music Building (Bldg. 4).

Aluminum Clerestory Fixed Windows

There are approximately 20 aluminum clerestory fixed windows at the one-story extension at the west side of the Theater Building (Bldg. 2). These windows measure approximately 3 feet wide and 18 inches high.

Window Frames

The unfinished aluminum frames are exhibiting surface corrosion. In concert with any sealing or glazing work, the following is recommended:

- Protect glazing, which is to remain.
- Cleaning the frames with a mild detergent and water.
- Removing surface corrosion by scrubbing with a pumice powder and pads.
- Replacing, in kind, missing and corroded frame-to-frame fasteners.
- Sealing surface with a clear coating to limit further corrosion.

Perimeter Seal

The perimeter seals between the window frames and brick (sides), precast concrete sill (bottom) and wood eave (top) have reached the ends of their service life and should be replaced. The following is recommended:

- Test sealant material to determine if asbestos or PCBs are present and if present, remove and dispose of material in accordance with local, state, and federal regulations.
- Completely remove and dispose of sealant and backing materials, taking care not to damage adjacent materials.
- Prepare substrate surfaces, prime as required by sealant manufacturer.
- Install new backing material and non-staining, elastomeric sealant. Protect adjacent materials from excess sealant.

Store Front

Aluminum storefront exists at the southwest corner of the Stage House where it meets the one-story brick extension. The storefront features floor-to-ceiling glass and appears to be in good condition. The storefront is approximately 200 square feet. No work is required at this time.

Exterior Doors

Two types of original exterior doors still exist at the Theater Building (Bldg. 2). There are no original exterior doors at the Music Building (Bldg. 4).

Type 1 – Custom curved wood doors: The north elevation of the Theater features four pairs of double wood doors set flush with the curving wood wall. The doors appear to be in good condition and require only regular maintenance.

In the future, an investigation of the finish should be undertaken to determine the original finish of custom curved wood doors. Paint analysis may reveal underlying colors or finishes that could inform the long-term preservation of the Theater.

Type 2 – Flush wood doors: A handful of flush wood doors still exist at Building 2, including the Ticket Office and one-story extension at the west side of the Theater. These doors are in good condition and require only regular maintenance.

Regardless of the door type, the original doors should be retained and repaired/upgraded to achieve consistent appearance and function.

Roofing

Main Roof

The Theater (Bldg. 2) and Music (Bldg. 4) Buildings feature single-ply membrane roofs. The upper roofs above the Theater including the lower roofs of the connecting wings are in fair condition with approximately half of their service life remaining. There are isolated areas of standing water and collection of debris. Some of this standing water is in contact with rooftop HVAC equipment and electrical conduits. Damage to rooftop equipment may occur if the standing water issues are not corrected. In the interim, an allowance is included to investigate and repair roof drainage issues that require immediate attention.

The roof at Building 4 appears to have been completed with the 2012 renovation. It is in good condition and does not require any repairs beyond periodic inspection and maintenance.

Include cost of new roof membrane with completion of upgrades to the rooftop HVAC system.

Parapets

The outside edge of the curved parapet at the poured-in-place concrete walls exhibits some deteriorated paint finish. These areas are not consistent and may be a result of a lack of a cap at the top of the concrete walls. The peeling paint is a visual issue only and additional investigation should be completed to determine the cause of the paint delamination.

Gutters and Downspouts

Internal gutters exist behind the curving parapet at the upper Theater roof. These gutters are an important feature of the building and should be maintained and preserved at any future roofing projects. Original construction documents indicate downspouts internal to the walls that discharge at grade. The gutters appear to be in good condition and it is recommended that periodic inspection occur to ensure the gutters function as designed. The downspouts should also be inspected periodically to ensure they are functioning as designed.

Covered Walkway Roof

Membrane

The roofs at the covered walkways feature single-ply membranes. These roofs are in fair condition and are approximately half-way through their service life.

Flashing and Trim

The covered walkway roof flashing and trim appears altered from the original details. See the gutter and downspout section below for more information.

Scuppers

The covered walkways appear to have originally featured integrated scuppers that projected from the steel pipe columns. The scuppers no longer appear to be in operation. Consideration should be given to restoring this feature and the flashing and trim during a future re-roofing project.

Eaves and Soffits

Eaves and soffits at the covered walkways are clad in stucco. These finishes appear to be in good condition and should be periodically inspected and maintained.

Linear recessed lighting is featured in the soffit at the covered walkway projecting west from the north elevation of the Theater. These fixtures should be replaced with LED-type lighting and a new lens. The length of the lighting is approximately 200 feet.

Interiors

Partition Walls

No work required.

Interior Doors

Existing Doors

The Theater (Bldg. 2) features four pairs of original plywood veneer doors at the entry vestibules at the north side of the theater. These original doors are in good condition and should be retained and repaired/upgraded to achieve consistent appearance and function. Other original doors with similar qualities should be identified and preserved in the same manner.

Finishes

Include an allowance for the preservation of interior finishes, including carpet and paint and acoustical treatment at the Theater. Preservation of the ceiling and proscenium are important priorities at the interior of the Theater.

Conveying Systems

No work required.

Plumbing

No work required.

Heating, Ventilating, and Air Conditioning (HVAC)

There is a mixture of HVAC equipment at the Theater Building (Bldg. 2), including hydronic heating and cooling system with individual and multi-zone air handlers. The HVAC equipment is located on the roof and at a mezzanine accessed from the stage. A chiller at Building 3 provides cold water to the air handlers. Assessment of Building 3 was not a part of the scope of work.

Additional HVAC is provided to other spaces in Building 2 by DX rooftop package units. These units are in fair condition and will need to be replaced in the next 5-10 years. Include cost to remove and replace in the short-term estimate

The HVAC system at the Music Building (Bldg. 4) was recently installed and is in good working condition. No work is required at Building 4.

Replace Existing Equipment at the Theater Building (Bldg. 2)

It is anticipated that the existing HVAC equipment at Building 2 will need to be replaced in the next 5 to 10 years. For the purpose of pricing assume the new system will be configured similar to the existing system.

Fire Protection

A number of minor fire and life safety deficiencies were identified at Building 2 during the conditions assessment. See Appendix 5 (Fire & Life Safety Evaluation) for more information. These include lack of seismic bracing on the fire riser, missing components to the sprinkler system and a damaged exit sign. Provide an allowance to address these deficiencies.

Fire protection at Building 4 exhibits no deficiencies. No work is required.

Electrical

The electrical system at the Theater Building (Bldg. 2) is of varied age and condition and some components should be replaced to improve reliability and efficiency.

Replace subpanels at Building 2 that may be original to the Building. Assume four subpanels for replacement at Building 2.

Replace all incandescent lighting at Building 2. Incandescent lighting currently exists at the theater and dressing rooms.

The Music Building (Bldg. 4) was recently upgraded. No electrical work is required.

Equipment

Evaluation of existing equipment at the Theater and Music complex was beyond the scope of work of this report.

Furnishings

The seating is an important character-defining feature of the Theater. The seats appear to date to the original construction. The layout and configuration of aisles should be maintained along with the original seats. The seat have previously been reupholstered, for future upgrades the cushions on the seats can be reupholstered rather than being replaced. The wood arms and painted metal sides can be refinished.

Site Work

Waterproofing and Repair of Brick Retaining Walls

The north end of the Theater is placed on a podium several feet above the natural grade of the campus. The podium consists of brick retaining walls and concrete stairs and slabs. Many of the retaining walls act as planting beds for shrubs and small patio trees. The brick walls exhibit deterioration and spalls similar to other brick walls on campus and should be repaired as follows:

Spalled and Cracked Brick Treatment

Evaluate plant material to determine if it is historically significant. Evaluate plant material for feasibility of salvaging and reinstallation. If feasible, remove and relocate plants. Excavate soil from behind retaining walls.

Remove and replace face-spalled and cracked brick. Replacement units are to match the size, color, texture, and material properties of the original bricks. Note that the brick units are a special size. Mortar used to set and point replaced brick units should be softer than the brick units (Type N or O) and match the color, aggregate, and tooling of the original mortar.

Waterproofing includes new damp-proofing at inside face of bricks that will be in contact with soil. Consider installing through wall drains at areas where the retention of moisture is more pronounced.

Assume excavation and damp proofing of 1,000 square feet of brick retaining wall. Assume 25 percent replacement of brick.

Buildings 35, 36, 37, 38, 39 | Math and Planetarium Complex

There are two reuse options for Buildings 35-39 as follows:

Alternatives 1A, 1B and 1C:	Alternatives 1A, 1B and 1C reuse the entire complex as an interdisciplinary center.
Alternatives 2A and 2B:	Alternatives 2A and 2B, require the demolition of the majority of the complex to provide space for a new planetarium. The East Math Wing (Bldg. 35) and its exterior canopy will remain and be for community use, including support of the new planetarium.

Schematic drawings and diagrams illustrating treatment recommendations for the complex are included in Appendix 1.

Figure 4: Math and Planetarium complex (Bldgs. 35-39).

Selective Demolition

For Alternatives 1A, 1B and 1C, selective demolition consists of the removal of additions added after the original construction.

For Alternatives 2A and 2B, West Math Wing (Bldg. 36), Reprographics (Bldg. 37) and Building 38 are demolished in their entirety. Building 39, the existing Planetarium, is moved in part or in its entirety.

See individual categories for demolition impacted by programmatic changes.

Alternatives 1A, 1B and 1C

Removal of additions added after the original construction:

- West Math Wing (Bldg. 36): 2,932 GSF is removed.
- Building 38: 435 GSF (Remove in its entirety).
- Planetarium (Bldg. 39): 1,159 GSF is removed.

Alternatives 2A and 2B

Demolitions:

- West Math Wing (Bldg. 36): 8,287 GSF (demolished in its entirety)
- Reprographics (Bldg. 37): 6,361 GSF (demolished in its entirety)
- Building 38: 435 GSF (demolished in its entirety)

Heating, Ventilation and Air-Conditioning (HVAC)

Remove HVAC units and associated ductwork, piping, curbs, and supports from canopy roofs. Remove registers and non-glass panels from clerestory windows to south of Math Wings (Bldgs. 35 and 36).

Removal of Hazardous Materials

A limited survey and sampling of asbestos containing materials (ACMs) was completed in 2005. A visual survey was completed as part of the Historic Structures Report in January 2015. This recent survey identified additional potential hazardous materials including ACMs, lead based paint (LBP), mercury, polychlorinated biphenyls (PCBs) and miscellaneous materials.

Asbestos: The 2005 survey identified window putty, leveling compound, linoleum flooring, vinyl floor tile, and transite pipe as being ACMs. A visual survey and assessment completed as part of the Historic Structures Report in January 2015 determined that additional ACMs may be present. Amongst those materials suspected as ACMs are acoustic ceiling tile, vinyl base and carpet mastic, insulation, grout, exterior expansion joints, counter top and sheet flooring. The complete list is contained in Appendix 6: Hazardous Materials Visual Assessment Report.

Lead: The January 2015 visual survey identified several items that potentially contain lead paint including, but not limited to, painted door and window systems, exterior painted walls, ceramic tile and roof systems. For more detail see Appendix 6: Hazardous Materials Visual Assessment Report.

PCB: The January 2015 visual survey identified potential polychlorinated biphenyls (PCB) in the ballast at fluorescent fixtures, concrete expansion joint caulking and window putty.

Other: Mercury was identified in the fluorescent light bulbs.

Structural

Foundations

Foundations: Programmatic Changes

Alternatives 1A, 1B and 1C:
- East Math Wing (Bldg. 35): Saw cut concrete and patch at new Food Prep.
- Reprographics (Bldg. 37): Demo slab and provide new 4-inch reinforced concrete slab at renovated and expanded restrooms.

Alternatives 2A and 2B:
- East Math Wing (Bldg. 35): Saw cut concrete and patch at new Food Prep.

Foundations: Structural Mitigation

Alternatives 1A, 1B and 1C, Math Wings (Bldgs. 35 and 36): New steel moment / braced frames at entire north wall of Buildings 35 and 36: saw cut existing slab, excavate and install new concrete grade beam at locations of new steel columns. Columns to be located 16 feet to 24 feet on-center. Patch concrete slab.

Alternatives 1A, 1B and 1C, Reprographics (Bldg. 37): Saw cut existing slab and install new foundation for new shear wall at mechanical space at north portion of Building 37. Length of new shear wall is approximately 12 feet.

Alternatives 2A and 2B, East Math Wing (Bldg. 35): New steel moment / braced frames at entire north wall of Building 35. Saw cut existing slab, excavate and install new concrete grade beam at locations of new steel columns. Columns to be located 16 feet to 24 feet on-center. Patch concrete slab.

Gravity Load Systems

Bearing Walls

Alternatives 1A, 1B and 1C, Reprographics (Bldg. 37): Provide new interior openings between the three large spaces at the south side of the proposed Maker Space. Assume two openings to be 5 feet wide. Provide new wood headers and associated framing at existing bearing walls.

Posts / Columns

Alternatives 1A, 1B and 1C, West Math Wing (Bldg. 36): A new opening at Building 36 is proposed to allow pedestrian access from the south parking lot to the new planetarium to be located north of Building 36 in these alternatives. This will require removing load bearing columns and walls and providing new columns as follows:

- Shore upper roof and clerestory framing at south wall.
- Remove existing exterior walls and window walls to create a 16-foot wide opening at the north and south walls.

- Assume four new steel columns and foundations as required to support roof and clerestory windows. Include lateral load mitigation strategies listed below.

Roof

No alterations required.

Lateral Load Systems

Shear Walls

New Shear Walls

Alternatives 1A, 1B and IC, East Math Wing (Bldg. 35), south wall: Provide new plywood shear walls. Shear walls will require relocating existing doors to create continuous walls from roof to foundation.

Alternatives 1A, 1B and IC, Reprographics (Bldg. 37): Provide new plywood shear wall with new foundation at mechanical space at north portion of Building 37. Length of new shear wall is approximately 12 feet.

Alternatives 2A and 2B, East Math Wing (Bldg. 35), south wall: Provide new plywood shear walls. Shear walls will require relocating existing doors to create continuous walls from roof to foundation. Assume two (2) 8-foot shear walls and two (2) four-foot shear walls. Assume that existing grade beams are adequate for attaching new shear walls.

New Shear Walls – Alternate to Supplemental Framing (Moment / Braced Frames)

Alternatives 1A, 1B and IC, Math Wings (Bldg. 35 and 36): As an alternate to Steel Moment and Braced Frames (see below) at the north wall of Building 35 and 36, provide shear walls at the interior of the building. See appendix A within Appendix 3 Structural Evaluation. For both buildings, assume three (3) locations, 8-foot in length and two (2) locations 4-foot in length. Saw cut existing slab, excavate and install new foundation, patch slab.

Alternatives 2A and 2B, East Math Wing (Bldg. 35): As an alternate to steel moment and braced frames (see below) at the north wall of Building 35 provide shear walls at the interior of the building. See appendix A within Appendix 3 Structural Evaluation. Assume three (3) locations, 8-foot in length and two (2) locations 4-foot in length. Saw cut existing slab, excavate and install new foundation, patch slab.

Supplemental Framing

New Steel Moment / Braced Frames

Alternatives 1A, 1B and IC, Math Wings (Bldgs. 35 and 36): Provide new steel moment or braced frames at entire length of north wall. Assume column spacing at 24 feet on center. Assume 7 columns at East Math Wing (Bldg. 35) and 8 columns at West Math Wing (Bldg. 36). See typical details in appendix B within Appendix 3 Structural Evaluation.

Alternatives 2A and 2B, East Math Wing (Bldg. 35): Provide new steel moment or braced frames at entire length of north wall. Assume column spacing at 24 feet on center. Assume 7 columns. See typical details in appendix B within Appendix 3 Structural Evaluation.

Diaphragms

New Diaphragms

Alternatives 1A, 1B and 1C, Math Wings (Bldgs. 35 and 36), Reprographics (Bldg. 37) and Planetarium (Bldg. 39): Provide new wood diaphragm cross ties per appendix B within Appendix 3 Structural Evaluation.

Alternatives 1A, 1B and 1C, Reprographics (Bldg. 37): Provide new wood diaphragm collectors / drags. See appendix B within Appendix 3 Structural Evaluation for locations.

Alternative 2A and 2B, East Math Wing (Bldg. 35): Provide new wood diaphragm cross ties per appendix B within Appendix 3 Structural Evaluation.

Enhanced Connections

Wall-to-Roof

Work Required

Alternatives 1A, 1B and IC, Reprographics (Bldg. 37) and Planetarium (Bldg. 39): Attachment of brick masonry walls to wood roof diaphragms is required at Building 37 and the orthogonal portion of Building 39. Provide new wall anchors at 4 feet on center per typical details in appendix B within Appendix 3 Structural Evaluation. See appendix A within Appendix 3 Structural Evaluation for locations.

Alternatives 2A and 2B: No work required.

Wall-to-Wall

No alterations required.

Wall-to-Foundation

No alterations required.

Exterior Enclosure

Exterior Walls

Brick Bearing Walls

Brick bearing walls are located at the following locations:

- North wall of Math Wings (Bldgs. 35 and 36) below the window walls.
- Portions of the east, west and south elevations of Reprographics (Bldg. 37).
- Planetarium (Bldg. 39), orthogonal portion of the building.

Brick bearing walls are to be preserved and maintained with the following treatments.

Spalled and Cracked Brick Treatment

Alternatives 1A, 1B and IC, Math Wings (Bldgs. 35 and 36), Reprographics (Bldg. 37) and Planetarium (Bldg. 39): Remove and replace spalled and cracked brick within bearing and clad walls. Replacement units are to match the size, color, texture, and material properties of the original bricks – note that the brick units are a special size ("utility" sized bricks, 2-7/8 inch square x 11-3/4 inches). Allow for replacement of 50 brick units.

Alternatives 2A and 2B includes brick treatment only at the north wall of the East Math Wing (Bldg. 35) and the brick wings walls. Assume no replacement of bricks at the north wall of Building 35.

Cracked and Deteriorated Joint Treatment

Carefully remove cracked and deteriorated mortar from joints to a depth of ¾-inch. Take care not to damage brick units. Pre-wet joints and install new Type-N mortar in two layers, color and aggregate to match the original mortar. Tool the joint profile to match original. Allow for repointing of 5 percent of brick mortar joints.

Efflorescence Treatment

Efflorescence is present at the base of the north walls of the Math Wings (Bldgs. 35 and 36); the efflorescence can extend up to approximately 3 feet.

Prior to finalizing treatment to remove the efflorescence, perform chemical and petrographic analysis to determine the type and source of efflorescence.

Visual observations indicate that the efflorescence is caused by over-irrigation and/or lack of drainage at planters and planting areas at the base of the north walls. Change to a drip irrigation system and locate lines a minimum of 5-feet away from the base of brick masonry walls.

Perform trial/sample cleaning to determine the gentlest cleaning that effectively removes the salts. If necessary and if determined by analysis results, chemically treat wall surfaces to remove efflorescence.

Treatment of Soiling and Biological Growth

Soiling and biological growth is present at a limited wall area that is not protected by overhanging eaves or canopies. Clean the wall with a mild detergent and biocide. Perform trial/sample cleaning to determine the gentlest level of cleaning that effectively removes the soiling and biological growth.

Assume 250 square feet of wall area requires cleaning and biocide treatment.

Brick Wing-Walls

Brick wing-walls are located to the south of the East Math Wing (Bldg. 35); the walls consist of two wythes of brick separated by a steel-reinforced grout core. The walls support the southern side of the canopy to the south of Building 12.

Spalled and Cracked Brick Treatment

An unusually large percent of the bricks within the wing-walls are experiencing spalling of the fired face of individual brick units. Visual inspection suggests that the deterioration is related to problems with the original manufacture of the brick. Spalling failure may be exacerbated by crypto-florescence, the formation of crystals within the body of the brick. Laboratory (petrographic) analysis is recommended to determine the cause of the deterioration prior to finalizing treatment. Additionally, we recommend testing of the in-place mortar, which may be too hard and also contributing to the deterioration of the brick.

Remove and replace face-spalled and cracked brick within bearing and clad walls. Replacement units are to match the size, color, texture, and material properties of the original bricks. Note that the brick units are a special size. Mortar used to set and point replaced brick units should be softer than the brick units (Type N or O) and match the color, aggregate, and tooling of the original mortar.

Assume 25-percent of brick units at the wing-walls require replacement.

Alternatives 2A and 2B includes brick treatment only at the north wall of the East Math Wing (Bldg. 35) and the brick wings walls. Assume no replacement of bricks at the north wall of Building 35.

Efflorescence Treatment

Efflorescence is occurs sporadically across the full height of the wing-walls.

Prior to finalizing treatment to remove the efflorescence, perform chemical and petrographic analysis to determine the type and source of efflorescence.

Visual observations indicate that the efflorescence is caused by over-irrigation and/or lack of drainage at planters and planting areas at the base of the wing walls.

Perform trial/sample cleaning to determine the gentlest cleaning that effectively removes the salts. If necessary and if determined by analysis results, chemically treat all of the wing-wall brick surfaces to remove efflorescence.

Poured-in-Place Concrete

Poured in place concrete is located at the circular walls of the existing Planetarium (Bldg. 39). The walls are in good condition and minimal work is required.

Surface Finish & Crack Repair

Alternatives 1A, 1B and 1C: Remove paint from entire surface of concrete on the Planetarium (Bldg. 39) using gentlest means possible; suggest abrasive treatment using walnut shells or similar as identified by small scale trials starting with the gentlest means possible. Assume 10 linear feet of crack repair. Prepare surface and paint.

Stucco-Clad Wood-Frame Walls

Stucco-clad wood-frame walls for Alternatives 1A, 1B and 1C are present at the following locations:

- South walls of the Math Wings (Bldgs. 35 and 36)
- Eastern most section of East Math Wing (Bldg. 35)
- West wall at West Math Wing (Bldg. 36) – may require repair following removal of west addition
- Walls at covered canopy between Buildings 35 and 36
- Portions of walls at Reprographics (Bldg. 37)

Stucco-clad wood-frame walls for Alternatives 2A and 2B are present at the following locations:

- South walls of East Math Wing (Bldg. 35)
- East end of Building 35
- West wall of Building 35

Stucco-clad wood-frame walls are to be preserved and maintained with the following treatments:

Stucco Repair

Alternatives 1A, 1B and 1C, Math Wings (Bldgs. 35 and 36) and Reprographics (Bldg. 37): There is minor weathering of the paint and stucco at the base of walls due to water damage. Stucco to be repaired by removing areas of damage and repairing surface to match adjacent surface. Assume 500 square feet.

Alternatives 2A and 2B, East Math Wing (Bldg. 35): There is minor weathering of the paint and stucco at the base of walls due to water damage. Stucco to be repaired by removing areas of damage and repairing surface to match adjacent surface. Assume 100 square feet.

Removal of Incompatible Repairs

Alternatives 1A, 1B and 1C, Math Wings (Bldgs. 35 and 36) and Reprographics (Bldg. 37): A number of incompatible stucco patches exist on the walls. Repair to include removal of cement plaster, repair to match adjacent texture. Assume 200 square feet.

Alternatives 2A and 2B, East Math Wing (Bldg. 35): A number of incompatible stucco patches exist on the walls. Repair to include removal of cement plaster, repair to match adjacent texture. Assume 50 square feet.

New Paint Finish

Alternatives 1A, 1B and 1C, Math Wings (Bldgs. 35 and 36) and Reprographics (Bldg. 37): Provide new paint finish at all stucco walls.

Alternatives 2A and 2B, East Math Wing (Bldg. 35): Provide new paint finish at all stucco walls.

Plywood-Clad Wood-Frame Walls

Plywood-clad wood-frame walls are present at the following locations:
- Panels at the south walls of the Math Wings (Bldgs. 35 and 36)
- East wall of East Math Wing (Bldg. 35)
- East and west walls of Reprographics (Bldg. 37)

Replacement of Plywood Panels

Plywood panels consisting of No. 1 clear natural birch are present at select locations. Originally a clear finish, these panels have been painted a dark grey color. A number of panels also have water damage at their base.

Existing plywood panels are to be removed and replaced in-kind with No. 1 clear natural birch plywood. Provide clear finish.

Alternatives 1A, 1B and 1C, Math Wings (Bldgs. 35 and 36) and Reprographics (Bldg. 37): Assume 800 square feet of new plywood with clear finish.

Alternatives 2A and 2B, East Math Wing (Bldg. 35): Assume 250 square feet of new plywood with clear finish.

Windows

Aluminum Window Walls

Replace and Repair

Alternatives 1A, 1B and 1C, Math Wings (Bldgs. 35 and 36):

Alternatives 2A and 2B, East Math Wing (Bldg. 35): Remove and replace all existing glass; remove and replace sealant; restore/adjust operations and hardware; clean, prepare, and clear-coat frames; and install safety/UV films as required.

Aluminum Clerestory Windows

Replace and Repair

Alternatives 1A, 1B and 1C, Math Wings (Bldgs. 35 and 36) and Reprographics (Bldg. 37): Alternatives 2A and 2B, East Math Wing (Bldg. 35): Remove and replace all glass; remove and replace sealant; restore/adjust operations and hardware; clean, prepare, and clear-coat frames; and install safety/UV films as required.

Wood Windows

Replace and Repair

Alternatives 1A, 1B and 1C, Reprographics (Bldg. 37): Remove and replace all glass with new laminated glass. Remove paint from frames, repair wood frames, prime and paint.

Louvers

Repair

Alternatives 1A, 1B and 1C, Reprographics (Bldg. 37): Clean, prepare and clear-coat existing aluminum louver at southwest corner of Building 37.

Exterior Sun Control

No repairs required at Buildings 35-39.

Exterior Doors

Type 1 – Solid Wood Doors

Relocate Doors

Alternatives 1A, 1B and IC, East Math Wing (Bldg. 35): Relocate five (5) exterior wood doors at the south wall of Building 35 to provide locations for new shear walls. See additional information at Lateral Load System. Relocation will require new openings in wood framed walls, including new wood framing and headers. Relocate doors into new wood frames to match existing. See repair of wood doors below.

Repair

Alternatives 1A, 1B and IC, Building Math Wings (Bldgs. 35 and 36), Reprographics (Bldg. 37) and Planetarium (Bldg. 39): Existing wood doors are in good condition. Refinish existing wood doors. Remove wood doors from frame. Repair wood frame and prep for new hinges and hardware. Remove all door hardware. Remove paint and repair damaged wood. Prepare door for new hardware. Prime and paint door. Rehang door on new hinges. Provide new ADA compliant hardware. Provide new push bar hardware at spaces over 990 square feet.

Alternatives 2A and 2B, East Math Wing (Bldg. 35): Existing wood doors are in good condition. Refinish existing wood doors. Remove wood doors from frame. Repair wood frame and prep for new hinges and hardware. Remove all door hardware. Remove paint and repair damaged wood. Prepare door for new hardware. Prime and paint door. Rehang door on new hinges. Provide new ADA compliant hardware. Provide new push bar hardware at spaces over 990 square feet.

Type 2- Hollow Metal Doors

Replace

Alternatives 1A, 1B and IC, Reprographics (Bldg. 37): Replace existing hollow metal door and frame at mechanical room.

New

Alternatives 1A, 1B and IC, Buildings Math Wings (Bldgs. 35 and 36), Reprographics (Bldg. 37) and Planetarium (Bldg. 39): Provide new rated hollow metal doors and frames at all mechanical and electrical rooms shown on plans.

Roofing

Main Roof – Low Slope, No Parapet

Remove and Replace Membrane and Repair Sheathing

At Alternatives 1A, 1B and IC, Buildings Math Wings (Bldgs. 35 and 36) and Planetarium (Bldg. 39) and Alternatives 2A and 2B, East Math Wing (Bldg. 35):

Remove existing membrane roof and all underlayment down to the exterior roof sheathing. Repair damaged sheathing. Assume 10 percent. Install new single-ply membrane roof.

Repair and Replace Flashing and Trim

Overhangs at the north and south walls of the Math Wings (Bldgs. 35 and 36) consist of metal drip edge over the original aluminum fascia panel.

At Alternatives 1A, 1B and IC, Buildings Math Wings (Bldgs. 35 and 36) and Planetarium (Bldg. 39) and Alternatives 2A and 2B, East Math Wing (Bldg. 35):

Provide new metal drip edge at all low slope roof edges. Remove paint from the aluminum drip edge, clean and protect.

New Gutters and Downspouts

Add Alternate: Add gutters to north and south roof eaves of the Math Wings (Bldgs. 35 and 36) for future water harvesting system.

Repair and Refinish Eaves and Soffits

Remove paint from existing wood soffits at the Math Wings (Bldgs. 35 and 36). Repair wood, prime and paint.

Main Roof – Low Slope, with Parapet

Remove Membrane and Repair Sheathing

Alternatives 1A, 1B and IC, Reprographics (Bldg. 37): Remove existing membrane roof and all underlayment down to the exterior roof sheathing. Repair damaged sheathing. Assume 10%. Install structural collectors and diaphragm cross ties at Building 37. Install new single-ply membrane roof. Provide new reglet and counter-flashing at parapet walls to receive roof membrane.

Canopy Roof

Remove Membrane and Repair Sheathing

At Alternatives 1A, 1B and IC, Math Wings (Bldgs. 35 and 36) and Reprographics (Bldg. 37) and Alternatives 2A and 2B, East Math Wing (Bldg. 35):

Remove existing membrane roof and all underlayment down to the exterior roof sheathing. Repair damaged sheathing. Assume 25 percent. Provide new metal drip edge at edge of canopy roof.

New Gutters and Downspouts

At Alternatives 1A, 1B and IC, Math Wings (Bldgs. 35 and 36) and Reprographics (Bldg. 37) and Alternatives 2A and 2B, East Math Wing (Bldg. 35):

Remove existing gutters and downspouts and install new galvanized sheet metal gutters and downspouts.

Repair and Refinish Eaves and Soffits

At Alternatives 1A, 1B and IC, Math Wings (Bldgs. 35 and 36) and Reprographics (Bldg. 37) and Alternatives 2A and 2B, East Math Wing (Bldg. 35):

Remove paint from existing wood soffits. Repair damaged wood. Assume 10 percent. Prime and paint soffits.

Other Roof(s) - Copper Dome

Investigation and Repair

Alternatives 1A, 1B and 1C, Planetarium (Bldg. 39): Provide allowance for copper investigation and repair, including repair of gutter system.

Skylights

Modify Framing

Alternatives 1A, 1B and 1C, Math Wings (Bldgs. 35 and 36) and Reprographics (Bldg. 37), at canopy roof: Modify existing framing to provide new skylights at exterior roof canopy at Buildings 35, 36 and 37. Assume 12 locations.

Alternatives 2A and 2B, East Math Wing (Bldg. 35), at canopy roof: Modify existing framing to provide new skylights at exterior roof canopy at Building 35. Assume 4 locations.

Interiors

Interiors will be fully modernized to meet the flexible needs of the campus community now and into the future. The interiors will be rehabilitated to provide comfortable spaces for a variety of functions.

The existing spaces are simply designed with clean lines and durable, low-maintenance materials. New finishes at administration, student and community spaces will be compatible with the original design. New finishes include carpet tiles, rubber base, paint, ceiling tiles and window treatments.

Original surface-mounted ceiling tiles will remain where feasible. Additional testing to determine if the tiles contain asbestos-containing materials is required. If replacement tiles are required, they should match the original tiles in size, color and texture. Selected ceilings may need to be lowered to accommodate new Heating, Ventilation and Air-Conditioning (HVAC) equipment. See HVAC section below for more information.

Manual window shades will be provided at the north window walls while motorized window shades will control daylight at the south-facing clerestory windows.

The original design of the classroom buildings incorporated many sustainable design principles including passive daylighting and natural ventilation. While the buildings will be retrofitted with new heating and ventilation systems, there are numerous opportunities to showcase the sustainable features of these buildings.

To improve their performance, additional study and energy modeling is recommended to fully understand the performance of the buildings over the course of a day and throughout the year. Clerestory glazing may be retrofitted with special performance glazing, like low-e, that reflects long-wave, or heat-generating, infrared waves while still allowing visible light to enter the building.

Mechanical, Electrical, and Plumbing (MEP)

Heating, Ventilation and Air-Conditioning (HVAC)

The current mechanical system relies on rooftop units placed on the covered walkways with supply air ducts compromising the clerestory windows. The current design is both unattractive and has caused some structural damage to the covered walkways that were not designed to carry the weight of these units.

Rehabilitation will include a new heating and ventilation system integrated with the spatial character of the interior. Preliminary design concepts include two primary options:

Option 1

A four-pipe system that uses hot and cold water loops to provide heating and air-conditioning. The four-pipe system includes a central plant with a chiller and boiler sized to provide hot and cold water to the Student Success Center and Classroom & Labs complex (Bldgs. 7-9), Business Education complex (Bldgs. 12-14), and Math and Planetarium complex (Bldgs. 35-39). The central plant will be discretely located to blend in with the campus landscape with screen walls and a roof. At the interiors, the hot and cold water loops will terminate in either fan coils or chilled beam and ceiling panels. The fan coils may require dropping a portion of the ceiling to accommodate the unit. Chilled beams or ceiling panels provide a more efficient system that could be left exposed at the interior of the spaces. Four-pipe hydronic systems require a greater up-front cost, but the systems operate more efficiently and have a greater life expectancy than the variable refrigerant system.

Option 2

The second option includes a variable refrigerant system (VRF) that moves refrigerant through a closed loop to provide heating and cooling. The VRF system includes ground-mounted heat pumps located outside the building. The outdoor units contain a compact footprint that can be integrated with screen walls located adjacent to the building. VRF systems allow for a single outdoor unit to serve multiple zones of a building, making them a good choice for multi-purpose buildings. A VRF system is a good choice for the classroom buildings because it requires only small-diameter pipes for moving refrigerant rather than large ducts that could be intrusive to the original spatial design. The refrigerant pipes connect with special compact fan coil units that could be located at ceilings or at the base of the window walls.

Electrical

The electrical system will be completely upgraded. Components beyond their useful service life, including transformers, main service panels and secondary distribution panels, will be replaced. Upgrade of the interior will include new lighting and power circuits.

Plumbing

Existing restroom spaces will be expanded and completely remodeled as part of the building rehabilitations. To make the reuse of existing water and waste lines possible, renovated restrooms will be located in current locations. Renovation of the restroom facilities will include removal and replacement of concrete floor slabs to provide easier tie-in of new fixtures with existing plumbing. Restrooms will be provided with new fixtures and accessories. Ceramic tile floor and wall tile is included.

Fire Sprinklers

Wet-pipe fire sprinkler system will be added to the classroom buildings to protect the buildings and occupants in the event of a fire. The sprinkler mains will be located in service rooms with the distribution piping and sprinkler heads left exposed in the spaces.

Communications and Security

Audio-visual equipment and wireless communications equipment will be installed to provide a 21st Century campus environment. New rooms with intermediate distribution frames (IDF) are provided at each complex.

A security system will be integrated with the overall campus security system to control access to the buildings and provide oversight of the campus environs. A security system could include closed-circuit cameras to monitor activity in and around the buildings. A comprehensive assessment of campus security was not part of this Historic Structures Report (HSR).

Site Work

Outdoor Spaces

New Plaza South of West Math Wing (Bldg. 36)

Alternatives 1A, 1B and 1C, relocate the new Planetarium to the north of West Math Wing (Bldg. 36). To provide direct access from the south, a portion of the north and south walls of Building 36, will be removed to provide a direct pedestrian path to the new Planetarium. To strengthen this axis, a new plaza is recommended for the space between Reprographics (Bldg. 37) and the existing Planetarium (Bldg. 39). This plaza will help funnel people through Building 36 to the new Planetarium. The plaza will also provide a meeting and gathering space for school and community groups arriving on campus. A small food service facility in the existing Planetarium will open directly onto this new entry plaza. The plaza will be landscaped to include benches and shade trees. The original reflecting pool at the southwest corner of the existing Planetarium may be restored to provide an additional amenity to this complex.

Building 93 | Swimming Pool complex

The Swimming Pool complex (Pools and Bleachers) is not viable for college swim events as it does not meet the required length for a competitive pool. Reuse options for the pools and bleachers include a community swim facility or pools for an adaptive therapy program. Both options will require a new pool building of approximately 5,000 GSF. The new facility will include reception, men's and women's changing rooms, food service, pool equipment and mechanical space.

Figure 5: Swimming Pool complex (Bldg. 93).

Selective demolition

Removal of Inappropriate Additions

Remove chain link fence from around bleachers.

Removal of Hazardous Materials

A limited survey and sampling of asbestos containing materials (ACMs) was completed in 2005. A visual survey was completed as part of the Historic Structures Report in January 2015. This recent survey identified additional potential hazardous materials including ACMs, lead based paint (LBP), mercury, polychlorinated biphenyls (PCBs) and miscellaneous materials.

Many potentially hazardous materials were identified in the pool equipment area that is currently located beneath the bleachers. The proposed plan calls for relocating pool equipment to a new location. Existing pool equipment beneath the bleachers will be removed.

Asbestos: The 2005 survey of asbestos containing materials (ACMs) identified pipe insulation and elbows as ACMs. A visual survey and assessment completed as part of the Historic Structures Report in January 2015 determined that additional ACMs may be present. The suspected ACMs include mastic, grout, exterior concrete expansion joints and exterior sub-surface transite pipes. With the exception of subsurface transite pipes which will remain encapsulated, the remainder of ACMs will be removed during the rehabilitation of the Swimming Pool complex.

Lead: The January 2015 visual survey identified several items that potentially contain lead paint including the paint around the edge of the pool and painted walls and handrails at the bleachers. Ceramic tiles at the base of the bleachers are also identified as potentially containing lead paint. These materials are to remain and no work is required at this time.

PCB: The January 2015 visual survey identified polychlorinated biphenyls (PCBs) in the ballast at fluorescent fixtures and in the concrete expansion joint caulking. These items will be removed and replaced during the rehabilitation of the pool and bleachers.

Other: Mercury was identified in the fluorescent light bulbs. The lighting will be removed and replaced with new lighting.

5-gallon buckets of hypochlorite being stored beneath the pool bleachers will be removed and stored in an area appropriate for the storage of pool chemicals and cleaners.

Structural

Foundations – Cast-in-Place Concrete Pool

The pool area consists of two separate gunite pools and surrounding concrete pool decks. The east pool is approximately 75-foot long by 24-foot wide. The west pool is approximately 75-foot long by 44-foot wide.

Surface Finish to Pools

Both pools require new plaster and new tile markings. For the purpose of pricing, assume new tile markings to match existing.

Gravity Load Systems

No alterations required.

Lateral Load Systems

Supplemental Framing

No alterations required.

Exterior Enclosure

Bleachers

Poured-in-Place Concrete Bleachers

The concrete bleachers are generally in fair condition with some deterioration, including cracks and spalls. The concrete surfaces are painted and much of the paint is peeling.

Cracked Concrete Treatment

Repair surface cracks by epoxy injection. Repair limited to 25 linear feet of crack repair. Repair areas of deteriorated concrete as required. Deterioration limited to 25 square feet.

Spalled Concrete Treatment

Repair spalls by removing loose concrete, cutting area square and clean, coating exposed rebar with anti-corrosion coating and patching concrete.

Assume 100 square feet of repair of concrete surfaces, including exposed concrete surfaces at existing pool equipment storage area.

Surface Finish Treatment

Nosing on stair treads and vertical surfaces at concrete bleachers are currently painted. Remove loose paint from these areas and provide new painted surface. Assume 1000 square feet of painted surfaces.

Interiors

Fittings

Signage

Include new site signage at Swimming Pool complex and interior and exterior signage at proposed pool building.

Mechanical, Electrical, and Plumbing (MEP)

Heating, Ventilating, and Air Conditioning (HVAC)

None at existing facilities. Include in cost for proposed pool building.

Electrical

The existing switch gear and transformers for the gym complex are located beneath the pool bleachers. This equipment is past its service life and will need to be replaced. A new mechanical space will be provided in the proposed pool building. Provide new electrical panels for the pool equipment, pool and site lighting and power and for the proposed pool building.

Plumbing

Include new ADA drinking fountains to replace existing at pool bleachers. Include new plumbing at proposed pool building.

Other

The pool equipment is to be relocated to a new location within the proposed pool building. The pool equipment varies in age. The existing pool heater (Lochinvar Copper Fin 2 CPN2072) is in good condition and can be relocated and reused at the new pool equipment room.

Fire Protection

None at existing facilities. Include new sprinklers in the cost for proposed pool building.

Equipment

None at existing facilities. Include food service and locker room equipment in cost for proposed pool building.

Furnishings

None at existing facilities. Include new furnishing for proposed pool building.

Site work

Selective Demolition

Remove existing concrete pool deck. Assume 5,000 square feet of new pool deck.

Site Development

Fences and gates

Provide new fencing and gates at the bleachers. Assume 100 linear feet of painted steel fencing with vertical pickets 4-inches on-center max, 8-foot high. Provide two (2) 5-foot gates.

Provide new fencing to separate the new pool building from the pool. Assume 100 linear feet of painted steel fencing with vertical pickets 4-inches on-center max, 8-foot high. Provide two (2) 4-foot gates.

Signs

Provide new site signage for the pool and bleachers.

Site Furnishings

Include new patio tables, chairs and umbrella for outdoor seating and lounging by the pool deck. Assume eight (8), 4-foot round tables with 4 chairs each. Assume 15 chaise lounges for around the pool.

Landscaping

Provide new landscape at entry to proposed pool building.

Site Utilities

Provide allowance for removal and relocation of utilities to new pool building.

Building 105 | Stadium

The LeBard Stadium is proposed for continued use as the campus' football facility. The Stadium underwent a significant disabled access project in the past ten years, incorporating new concrete ramps and accessible seating. The treatments for the Stadium address preservation and repair of the bleachers and original press box located at the top of the east bleachers.

The existing visitor's press box located above the bleachers at the west side of the stadium is in poor condition and is proposed for removal and replacement. The new press box at the west end of the Stadium is assumed to be approximately 200 GSF.

Figure 6: The LeBard Stadium (Bldg. 105).

Selective demolition

Removal of Inappropriate Additions

Remove existing wood framed press box at the west bleachers and replace with new wood-framed press box (200 square feet).

Removal of Hazardous Materials

A visual survey of potentially hazardous materials was completed as part of the Historic Structures Report in January 2015. This survey identified potential hazardous materials including ACMs, lead based paint (LBP), mercury, polychlorinated biphenyls (PCBs) and miscellaneous materials.

Asbestos: A 2005 survey of asbestos containing materials (ACMs) conducted in other parts of the campus did not include the Stadium. A visual survey and assessment completed as part of the Historic Structures Report in January 2015 identified potential ACMs. Based on work prosed for the Stadium, the following potential ACMs are assumed to be impacted:

- Exterior concrete expansion joints: remove and replace expansion joints where concrete is repaired and replaced.
- Concrete: to be impacted by concrete repair / replacement at bleachers.
- Roofing material: assume removal of existing roof and new roof at press box above bleachers at east end of the Stadium.

Lead: The January 2015 visual survey identified several items that potentially contain lead paint including painted wood members and wall surfaces at the east press box. Sampling of existing paint is required to confirm the presence of lead paint. Assume limited amount of lead paint requiring limited containment.

PCBs: The January 2015 visual survey identified polychlorinated biphenyls (PCB) in the ballast at fluorescent fixtures, concrete expansion joint caulking and window caulking. Fluorescent fixtures will be removed and replaced during the rehabilitation of press box. Remove and replace concrete expansion joints where concrete is repaired and replaced. Assume 100 linear feet. Window caulking will be removed and replaced in its entirety at the east press box.

Other: Mercury was identified in the fluorescent light bulbs. The lighting will be removed and replaced with new lighting.

Structural

Foundations – Cast-in-Place Concrete Bleachers and Aisles at Stadium

Original construction documents show that the stadium consists of a series of horizontal and vertical concrete pours separated by construction joints. The concrete is structural, stabilizing the earthen fill on which the stadium seating is constructed. The concrete also provide a base for the attachment of the aluminum benches. Concrete pours were tied together with continuous rebar, indicated as #3, on the original construction drawings. Horizontal pours are indicated as 3-1/2 inches. The drawings provide an option for the vertical pours: 3 inches for gunite or 3-1/2 inches for poured concrete. It appears that the vertical walls were constructed with poured concrete. See D/S-1 from the original construction documents for more details.

The primary deficiency identified at the Stadium is surface spalls and cracks at the poured-in-place concrete risers that form the structural base for the bleacher seating. Moisture has been able to enter the concrete and has caused significant rust-jacking of the steel reinforcing bars. As steel expands when it corrodes, the surface of the concrete has “popped” loose in many locations, exposing the vertical reinforcing bars. A lack of concrete cover at the face of concrete pours contributes to the failing concrete at the vertical surfaces. Many of the spalls have been patched, but the issue remains an on-going maintenance item.

Spalled concrete is not present at the concrete pours at the walking aisles.

Additional investigation should be completed prior to undertaking repair or replacement of the cast-in-place concrete at the bleachers. Investigation shall confirm location of rebar, amount of concrete cover and other construction details.

Two options are included for the concrete bleachers. The repair option is less expensive and intensive of the two options. The replacement option requires significant excavation and rebuilding of the bleachers at a much greater cost. The benefit of the replacement option is that it may be a more permanent fix and may minimize on-going maintenance and repair costs.

Mock-ups are recommended for the repair and replacement of concrete at the stadium bleachers and aisles.

Repair Option

Remove existing aluminum benches and mounting brackets and save for reinstallation. Cut the area to be patched square, at least 2 inches beyond the exposed rebar. Remove all loose concrete. Clean exposed vertical rebar to bare metal and treat with anti-corrosion coating. Patch concrete to match adjacent surfaces.

East Bleachers: 5,586 linear feet (LF) x 1.16 = 6,480 square feet (SF) of exposed concrete surface.
Assume 20% repair = 1,296 SF of surface repair.

West Bleachers: 3,906 LF x 1.16 = 4,531 SF of exposed concrete surface
Assume 20% repair = 781 SF of surface repair.

Total assumed patch repair is 2,077 SF for the east and west bleachers.

Note: The cost estimate includes the cost of concrete repair only.

Replacement Option

The replacement option includes the removal of damaged concrete and replacement with new cast-in-place concrete. Due to presumed original construction methods, it is necessary to remove both horizontal and vertical surfaces adjacent to the replacement area in order to dowel into adjacent construction.

Note: The unit cost for replacement has not been included in the cost estimate.

Cast-in-place concrete retaining and site walls

Original Cast-in-place concrete walls are located adjacent to original ramps and stairs. A number of these walls have cracks through their entire width. The walls do not appear to be overturning.

Crack Investigation and Repair

Provide Allowance to investigate and repair cracks at original site walls.

Gravity Load Systems

No alterations required.

Lateral Load Systems

Shear Walls

No alterations required.

Supplemental Framing

The original stadium press pox, located above the east bleachers, lacks a lateral force resisting system. Provide a new steel moment frame, including concrete foundations at the press box.

Metals

Steel Handrail and Railings

Staining from the corrosion of steel pipe rails and railings is prevalent around the Stadium complex. While the pipes appear to be galvanized, the areas embedded in concrete or welded to base plates and anchors are not galvanized leaving surface area exposed to moisture. Besides being an aesthetic issue, the oxidation has the potential to damage concrete: When steel corrodes it expands causing adjacent concrete surfaces to spall. This process is known as rust-jacking. There are several locations where the concrete has come loose due to rust-jacking.

Due to the extent of this issue and the fact that the areas needing treatment are often encased in concrete, it is recommended that additional testing be performed prior to determining a treatment strategy. Rust-inhibiting coatings and cathodic protection are potential treatments, but more research is necessary to evaluate their effectiveness and to understand the different conditions around the Stadium.

Provide allowance for additional investigation and mock-ups.

Exterior Enclosure (Press Box)

Wood-Frame Walls

The press box above the east bleachers is a wood framed structure with plaster and “flexboard’ cladding. The flexboard panels are assumed to be asbestos containing.

Surface Finish Repairs

The plaster needs minor repairs to approximately 10% of its surface area. The flexboard panels will remain and need a new coat of paint.

Windows

A piece of canted glazing has become displaced from the vertical mullion at the northwest corner of the press box.

Glazing Repairs

It is recommended that all glazing be removed and a new installation detail be provided to properly support the glazing within the frame.

Exterior Wood Features

Wood Trellis at Southwest Corner of the Press Box

The open trellis overhang at the southwest corner of the press box is an important character-defining feature that requires repair. The overhang consists of a two cantilevered wood beams running north-south with perpendicular joists spanning between the beams. The joists are attached to the cantilevered wood beams with approximately 4” steel angles. This feature has been heavily painted making it difficult to evaluate the condition of the wood. A sheet of plywood has been placed over five of the wood joists obscuring the original extent of the wood trellis.

Repair and Replacement

It assumed that the wood joist will need replacement and that wood repair is required for the cantilevered wood beams. Detach wood joists from steel angles. Remove paint from steel angles and cantilevered wood beams. Repair cantilevered wood beams as required.

Assume eight (8) new 3-inch by 8-inch wood joists connected to existing steel angles. Provide new paint finish.

Exterior Doors

There are exterior wood doors at the north and south elevation of the Press Box. These doors need new paint.

Roofing

The existing rolled roofing is in good condition and does not need to be replaced at this time.

A 4-foot section of steel pipe rail is required to close off the roof where there is currently no railing.

Interiors

The interior of the press box does not require any reconfiguration at this time.

Building 110 | Field House

The Field House currently provides office space for coaches, box offices for home and visitor ticket sales, and restrooms. It no longer provides locker rooms or concessions as originally designed. A major rehabilitation is proposed at Alternative 1A to make the Field House a fully-functional building. The rehabilitation proposes new restrooms, storage space and offices. Additionally, the weekend Swap Meet will continue to use the Field House for its operations.

The rehabilitation will include the replacement of all systems and new interiors. The exterior of the Field House will be cleaned-up including removal of exposed conduits and incorporation of more sympathetic lighting.

The Field House is proposed for demolition in Alternatives 1B, 1C, 2A and 2B.

In summary, the proposed options for the Field House (Bldg. 110) are as follows:

Alternative 1A:	Major rehabilitation to make the Field House a fully-functional building including new restrooms, storage space, offices and a base for the weekend Swap Meet operations.
Alternatives 1B, 1C, 2A and 2B:	Alternatives 1B, 1C, 2A and 2B, propose the demolition of the Field House.

Figure 7: The Field House (Bldg. 110).

Selective Demolition

Removal of Inappropriate Additions

Remove the recent wood-framed ticket offices at the southwest and southeast corners. These additions measure approximately 80 square feet each.

Removal of Hazardous Materials

A limited survey and sampling of asbestos containing materials (ACMs) was completed in 2005. A visual survey was completed as part of the Historic Structures Report in January 2015. This recent survey identified additional potential hazardous materials including additional ACMs, lead based paint (LBP), mercury, polychlorinated biphenyls (PCB) and miscellaneous materials.

Asbestos: The 2005 survey identified a number of ACMs in the Field House including exterior transite panels and a number of materials related to the boiler room. The January 2015 visual survey identified a number of additional potential ACMs including, but not limited to, ceilings, walls, window putty, exterior stucco, roofing, mastic and HVAC components. Sampling of potential ACMs should be undertaken to clarify the extent of ACMs in the Field House. Since the proposed plan includes significant remodeling, assume asbestos abatement in the scope of work.

Lead: The January 2015 visual survey identified several items that potentially contain LBP including painted interior and exterior painted surfaces, painted concrete floors. Sampling of existing paint and other materials is required to confirm the presence of LBP. Assume limited amount of lead paint requiring limited containment.

PCB: The January 2015 visual survey identified polychlorinated biphenyls (PCB) in the ballast at fluorescent fixtures, concrete expansion joint caulking and window caulking. Fluorescent fixtures will be removed and replaced during the rehabilitation of the Field House. Window caulking will be removed and replaced in its entirety at the Field House. Assume limited impact on the concrete expansion joint caulking.

Other: Mercury was identified in the fluorescent light bulbs. The lighting will be removed and replaced with new lighting. The HVAC system potentially contains hydrochlorofluorocarbons (HCFCs). The existing HVAC system will be removed in its entirety and replaced with new.

Structural

Foundations

No foundation work required.

Gravity Load Systems

Bearing Walls

Assume four (4) new wood-framed openings in exterior walls for new exterior doors to accommodate reuse plan.

Posts / Columns

No changes to posts and columns are required.

Roof

No changes to the roof framing system are required.

Lateral Load Systems

Shear Walls

No new shear walls are required.

Supplemental Framing

No supplemental framing is required.

Diaphragms

No work required.

Enhanced Connections

No enhanced connections are required.

Exterior Enclosure

Exterior Walls

Wood-Frame Walls

Wood-frame walls at the Field House (Bldg. 110) are clad in both stucco and transite panels. The transite panels are believed to contain asbestos. Samples are required to confirm. The panels appear to be in fair condition. Other surfaces are a stucco finish.

Repairs

For pricing assume minor repair of approximately 25 percent of surface at Field House. New paint for entire building.

Windows

Aluminum windows

Aluminum hopper windows are inset between wood posts at the north and south elevations. These windows are in fair condition and require routine maintenance.

Glazing

Glazing putty (sealant) is deteriorated and needs replacement. Window glass is generally in good condition, although some have had film applied to obscure the interior. In concert with other window work, the following is recommended:

- Test putty material to determine if asbestos or PCBs are present and if present, remove and dispose of material in accordance with local, state, and federal regulations.
- Completely remove and dispose of outer putty. Take care not to damage glass or window frame.
- Remove and salvage existing glass. Remove any paint coatings and putty residue. Clean glass and label pieces for reinstallation in original location.
- Completely remove and dispose of bedding putty.
- Treat window frames as described below.
- Reinstall glass, bed glass in non-staining silicone sealant and install outer fillet bead of non-staining silicone sealant. Follow recommendations in the latest edition of the "*Glazing Manual*" published by the Glass Association of North America (GANA).

Window Frames

The unfinished aluminum frames are exhibiting surface corrosion. A number of fasteners that connect pieces of the frames are missing. In concert with sealing and glazing work, the following is recommended:

- Protect glazing that is to remain.
- Clean the frames with a mild detergent and water.
- Remove surface corrosion by scrubbing with a pumice powder and pads.
- Replace, in kind, missing frame-to-frame fasteners.
- Seal surface with a clear coating to limit further corrosion.

Awning Sash

The following treatment is recommended:

- Treat frames and glazing as described above.
- Survey sash to determine damaged or missing hardware, such as hinges, delimiters, and latches.
- Replace damaged or missing hardware.
- Clean and lubricate hardware.
- Install neoprene weatherstripping.
- Adjust sash to assure operation.

Perimeter Seal

The perimeter seals between the window frames and brick (sides), precast concrete sill (bottom) and wood eave (top) have reached the ends of their service life and should be replaced. The following is recommended:

- Test sealant material to determine if asbestos or PCBs are present and if present, remove and dispose of material in accordance with local, state, and federal regulations.
- Completely remove and dispose of sealant and backing materials, taking care not to damage adjacent materials.
- Prepare substrate surfaces, prime as required by sealant manufacturer.

- Install new backing material and non-staining, elastomeric sealant. Protect adjacent materials from excess sealant.

Exterior Doors

Wood Doors

Exterior wood doors are in varying conditions. A number of doors are in fair condition and can be reused with minimal repairs. Other doors need to be replaced.

Assume repair of six (6) wood doors and frames. Provide new hardware.

Hollow Metal Doors

Provide six (6) new hollow metal doors in hollow-metal frames. Hollow metal doors to be provided at storage, service and restrooms, typically.

Roofing

Membrane

Remove existing membrane roof and all underlayment down to the exterior roof decking. Assume several layers of roof are present beneath the current membrane roof. Repair damaged decking. Assume 10 percent. Install new single-ply membrane roof.

Flashing and Trim

Provide new metal drip edge at all low slope roof edges.

Interiors

Partition Walls

New walls

Provide new wood-framed partition walls with gypsum board finish as required for new uses. Assume 80 linear feet of new wall.

Interior Doors

New Doors

Provide new solid wood doors in wood frames as required. Assume four (4) new doors and frames. Provide painted finish.

Provide four (4) new hollow metal doors and frames for service and storage rooms.

Finishes: Assume all new finishes, including carpet and ceiling tile.

Fittings

Signage

Provide new room and building identification signage.

Lockers

Provide new lockers at Swap Meet office space. Assume 20 new lockers.

Mechanical, Electrical and Plumbing (MEP)

Heating, Ventilating and Air-Conditioning

Assume new mechanical system for the building. Rooftop package unit with new ducts and registers. Size for 8 tons.

Electrical

Electrical panel boards are in good condition. Provide new distribution to the Offices.

Plumbing

Restrooms

Provide new restrooms at the east and west end of the Field House. New restrooms are approximately 800 square feet each. Assume new fixtures and finishes.

OVERVIEW

SUMMARY

The Preservation Alternatives within this document have been prepared to supplement the Historic Structures Report. The purpose is to provide Coast Community College District (CCCD) and Orange Coast College (OCC or College) with examples of viable reuse strategies for their pre-1958 buildings designed by Master Architects Richard Neutra and Robert E. Alexander and recommendations for compatible treatment of the Garrett Eckbo designed landscape. The primary focus of the alternatives is the three classroom building complexes within the campus' central core, sometimes referred to as "bar" buildings. Singular options are also provided for the Swimming Pool (Bldg. 93) and Field House (Bldg. 110).

The alternatives examine the reuse of the following structures which originally functioned as follows:

- College Library (Student Success Center, Bldg. 7)
- Classrooms & Labs (Bldgs. 8 & 9)
- Business Education (Bldgs. 12-14)
- Science Department Classrooms & Labs (Math Wings & Reprographics, Bldgs. 35-37)
- Planetarium (Bldg. 39)
- Football Stadium and Field House (Bldgs. 105 & 110)
- Swimming Pool (Bldg. 93)

The impetus for the Preservation Alternatives stems from the research and analysis conducted by Page & Turnbull for the Orange Coast College Historic Structures Report (HSR). The findings of the report identify the remaining Neutra and Alexander buildings as eligible for listing on both the National and California Registers of Historic Places as a Historic District. The Eligible Historic District (Historic District) consists of the buildings noted above as well as the Theater and Music Building (Bldgs. 2 & 4). It is considered a discontiguous district because the Swimming Pool (Bldg. 93), Stadium and Field House (Bldgs. 105& 110) are separated geographically from the instructional buildings.

Current Building Projects

Coast Community College District has pursued two measures over the past 16 years to support growth at their three campuses. *Measure M* was voted into effect by the community in 2012 and *Measure C* kicked off the building phase at the OCCD in 2002. Both measures, along with state funding, have financed OCC's effort to design and construct 21st century instructional spaces for students, faculty and staff. Current projects in the queue include a Chemistry Building, Business/Math/Computing Center, Language Arts/Social Studies Building, and a Recycling Center. Projects on the horizon include a new Planetarium; Multidisciplinary Building; Administration Building; Adaptive PE, Gym, and Pool Facility; and Student Center. The result of all this construction leaves the pre-1958 Neutra / Alexander buildings vacant.

Neutra / Alexander Buildings

Although suffering from a lack of maintenance, claustrophobic infill, and make-shift solutions for mechanical systems, the historic buildings <u>are</u> capable of meeting the educational and comfort needs of the 21st century college campus. Renovations and systems upgrades can be done sensitively to return the buildings to their original glory.

While appropriately scaled, Buildings 10, 11, 38, and 72, and additions to Buildings 7 and 14 have crowded the quads that once separated the Neutra / Alexander buildings at the Central Core. The removal of these infill buildings will open the center of the campus, re-invigorate existing outdoor rooms, and return beautiful, human scaled quads to the campus, unhindered by the shadows of multi-story buildings.

PROPOSED PRESERVATION ALTERNATIVES

The alternatives proposed by Page & Turnbull fall within the acceptable limits of maintaining a Historic District. They are the result of program and planning research and analysis, and examine the feasibility of accommodating different, but complimentary uses to support both the College and the Community.

Criteria

The following criteria were used to guide the investigation of alternative uses:

Alignment with College Mission, Vision and Values: The designation of the Historic District and the renovation of the historic buildings within the District provide the College with an opportunity to teach through example by being responsible stewards of our built environment. The campus zones identified in the Vision 2020 Master Plan create silos of learning surrounding an oversized quad with very little cross pollination of departments. Creation of spaces which bring students together from different departments to work together mimics the work environment of many careers in the real world. The historic bar buildings physically connect the north and south sides of campus and are best positioned to house innovative interdisciplinary programs focused on technical education, basic skills, technical equipment training, and group projects.

Retention of the historic buildings will only enhance OCC's Vision "[t]o be the standard of excellence in transforming lives through education" and allow the College to provide a physical example of their Values known as CLASS: Community, Learning, Access, Stewardship, and Sustainability. The new uses proposed for the historic buildings within the Central Core of the campus shall foster "…a respectful, supportive and participatory campus climate of student engagement and academic inquiry" (OCC Mission Statement).

Alignment with the Vision 2020 Facilities Master Plan Key Planning Assumptions: The preservation and reuse of the Neutra / Alexander buildings meets many of the objectives identified within the Coast Community College District Vision 2020 Facilities Master Plan for Orange Coast College:

Make provisions for accommodating new career technology programs.
Proposed uses include an Interdisciplinary Center which would house a Makerspace where existing equipment from the Architecture Department could be housed along with new equipment to create a place where students from Architecture, Science, Art and other departments could learn how to work together. The need for new career technology programs may emerge.

Campus zoning will be a priority in the facility plan of the future.
As noted earlier, the proposed zoning from the Master Plan creates silos of learning. The Neutra / Alexander buildings located at the Central Core of the campus create connections between various zones, linking north and south.

Restoration of the original east-west pedestrian pathway provides another strong connection between the east and west edges of the campus.

Future site development will seek to UNIFY the campus.

Rehabilitation of the Neutra / Alexander buildings and the Eckbo landscape at the Central Core of the campus has the ability to help unify the campus. This would be achieved through the adaptive reuse of the buildings and recreation of Eckbo's east-west connection and expansion of his idea of creating outdoor rooms and nodes. This is a very different approach than the one proposed in the Master Plan which demolishes the Neutra / Alexander buildings, ignores the Eckbo landscape and creates a sea of green further separating the various zones from each other.

Aesthetics are viewed as important in defining/reflecting the College's identity.
It appears aesthetics have been important to OCC since its inception in 1948 when the College hired Neutra, Alexander, and Eckbo to master plan their new college and design its earliest buildings and the landscape that surrounds them. Neutra and Alexander are considered to be master architects and Eckbo, a frequent contributor of Neutra and Alexander, is well-known for his landscape designs.

The creation and maintenance of open space and planned landscaping is a priority for campus development.
Retention of the Neutra / Alexander buildings provide more intimate green spaces, appropriate for a college campus, once non-contributing infill buildings and additions are removed. The enormous quad proposed as part of the master plan can accommodate six (6) football fields – three across by two high between the Forum and the Arts Zone – and gives a feeling of disconnection between the north-south and especially between east-west.

An increase in grass areas at OCC will increase water usage and time spent mowing. This may negatively impact the Facilities Departments budget for landscape maintenance and they may not have the staff to adequately maintain the significant increase in lawn maintenance.

Sustainability is an important element in the future planning/development of the campus.
Renovation and reuse of an existing building is the most sustainable approach to accommodating change and growth. Smaller, campus sized green spaces allow for a variety of sustainable landscaping to be designed and could provide learning opportunities for both students and the community. California is currently in one of the worst droughts in our history. Creating smaller landscaped areas and using drought tolerant plantings which decrease the College's dependence on water for landscaping is a sustainable approach to future development of the campus. As noted earlier, the College has an opportunity to highlight their stewardship of both their natural and built environments and use the Neutra / Alexander buildings and the approach to the surrounding landscape to encourage change in their community.

Enhancement of the campus' physical image to the surrounding community including both physical and visual access to services and the academic core from community edges and campus periphery (Vision 2020 FMP, p.91).
Retention of the Neutra / Alexander buildings and removal of non-contributing

additions and infill buildings will enhance and improve the physical and visual access on campus.

The Master Plan reflects development of pedestrian nodes or plazas at naturally occurring and significant intersection along these spines. These nodes and plazas allow for placement of campus maps to assist in way finding and together with seating, opportunities for meeting friends and informal interaction…places to see and be seen. (Vision 2020 FMP, p.100).
Retention of the Neutra / Alexander buildings and removal of non-contributing additions and infill buildings will significantly improve way-finding. Pedestrians will again be able to see along the north-south 45-degree angle. Bringing back the original east-west connection and enhancing the "nodes" that already exist each Neutra / Alexander building complex in the Central Core also meets the intention of the Master Plan.

Functionality: The uses must be functional and meet a need on campus. The natural flexibility inherent in the 8' structural module of the buildings will allow for future modifications as necessary to accommodate the changing needs of a college campus.

Historical Appropriateness: Adherence with the Secretary of the Interior's Standards for Treatment of Historic Properties and retention of a historic district eligible for listing on the National and California Registers of Historic Properties is fundamental for all Preservation Alternatives. Removal of non-contributing additions and buildings within the Historic District will return the buildings to their period of significance. All renovations must be reversible per the Secretary of the Interior's Standards.

Vision and Goals

The vision for Preservation Alternatives at the Central Core of the campus is to restore the original exterior appearance to the Neutra / Alexander buildings, remove non-contributing additions and infill buildings, reestablish spatial relationships between the Neutra / Alexander buildings, and reestablish the east-west pedestrian axis connecting the Neutra / Alexander building complexes through Eckbo's landscape. Create a Historic Core for the campus that reflects the history of Orange Coast College but also embraces its future.

Additional goals include:

- Return usable open spaces to the Central Core of the campus.
- Create new outdoor rooms and enhance original outdoor rooms emphasizing Eckbo's indoor/outdoor relationships and the flexibility he wanted in his landscape designs.
- Include passive and active environments at open spaces and outdoor rooms.
- Provide a small food service element at the node within each building complex.
- Keep new development outside of the Historic District.
- Create connections between zones on campus.

Preservation Approach

Because change is necessary and expected on a college campus to keep up with changes in teaching styles, learning styles, and technology, the most appropriate approach for the eligible Historic District is to implement the Secretary of the Interior's Standards for Rehabilitation. It is expected that the Preservation Alternatives will meet the Secretary of the Interior's Standards for Treatment of Historic Properties and/or retain a historic district eligible for historic listing. Per the direction of the College, the uses recommended within the Alternatives shall:

- Relate to OCC's mission;
- Not introduce new classrooms;
- Meet the Key Planning Assumptions in the Vision 2020 Facilities Master Plan; and
- Limit the impact on new construction proposed in Vision 2020.

As part of the rehabilitation approach, the goal is to retain the greatest amount of historic fabric, fixtures and materials in place and remove non-contributing elements, including heating, ventilating and air conditioning (HVAC) systems, infill buildings and additions. The clerestory windows on the 'bar' buildings shall be restored to allow natural light to enter the rooms below. Where this is problematic for projection use it is recommended that black-out shades be used instead of black-out film on the glazing panels.

Reconstruction is recommended for the fireplace that originally sat within the lounge at the original Library (Bldg. 7). Reconstruction of Building 14 at the Business Education complex with new materials where insensitive additions have camouflaged the original building.

Sensitive additions to a historic building can be pursued but shall:

- Retain the historic character
- Respect the historic architecture and landscape
- Be compatible with the historic architecture
- Not destroy character defining features or materials
- Be reversible

The following Preservation Alternatives have been provided for consideration.

Preservation Alternative 1

Preservation Alternative 1 is the maximum reuse alternative. In order to preserve the Historic District and maximize the buildings saved the new Planetarium has been relocated to the north edge of the Historic District. Removal of non-contributing buildings and additions constructed after 1957 retains the most complete example of the Historic District. This maintains the integrity of the Historic District and unifies the campus with a signature central core.

Restoration of the original circulation pattern through the buildings is key to this alternative. Minor alterations to character-defining features have been proposed such as skylights at the covered walkways and upgrades to structural systems to increase seismic resistance.

It should be noted that Alternatives 1B and 1C do allow for the demolition of the Field House (Bldg. 110) and the Swimming Pool complex (Bldg. 93).

Alternative 1 includes three sub-options. A snapshot of the sub-options can be seen in the Preservation Alternatives Use Matrix on the following page.

Preservation Alternative 2

Preservation Alternative 2 is considered a strategic reuse alternative where the new Planetarium remains at its proposed location. The impact to the Historic District is greater in this alternative because of the loss of Buildings 36, 37, and 39 that spatially define the complex which originally housed the sciences at OCC. While not preferred, the removal of Buildings 36, 37, and 39 do not jeopardize the eligibility of the Historic District. However, removal of any additional historic fabric beyond what has been identified in Preservation Alternative 2 would eliminate any possibility of a Historic District.

Demolition proposed as part of Alternative 2 includes:

- Field House (Bldg. 110)
- Swimming Pool complex (Bldg. 93)
- Non-contributing structures along the north edge of the Historic District
- Non-contributing additions to Building 14
- Non-contributor Special Services (Bldg. 10)
- Non-contributor Faculty House (Bldg. 11)

Minor alterations to character defining features are the same as noted in Alternative 1: skylights at covered walkways and upgraded structural systems to supplement the existing system for seismic strengthening.

Preservation Alternative 2 includes two sub-options. In Alternative 2B an addition to Building 7 has been proposed to house the Dance Department. A snapshot of the sub-options can be seen in the Preservation Alternatives Use Matrix.

Future Flexibility

College campuses are continually evolving. Whether the impetus is technology or new programs, institutes of higher learning continually want to stay ahead of the curve. Therefore, it is helpful when buildings on college campuses have built in flexibility.

At some future date when OCC has the need for more classroom space or somewhere to test a new program, the Neutra / Alexander 'bar' buildings may be well suited for another renovation. The buildings were designed on an 8-foot module, including the window wall mullions. This provides ideal flexibility for re-sizing rooms without jeopardizing access to natural light or creating odd interior/exterior end-wall connections.

Cost Summaries

Cost summaries have been developed and are provided as part of each proposed Preservation Alternative. They can be found in the Preservation Alternatives sections. Caveat Emptor: Cost Summaries are based on Page & Turnbull's Scope of Work only and does not include related work as defined by CCCD.

PRESERVATION ALTERNATIVES USE MATRIX

Neutra / Alexander Complex	Alternative 1A	Alternative 1B	Alternative 1C	Alternative 2A	Alternative 2B
Music and Theater (Buildings 2 and 4)	No Change of Use Planned

BACKGROUND

PAGE INTENTIONALLY LEFT BLANK

BACKGROUND

Page & Turnbull was hired in November 2014 by Coast Community College District to provide a Potential Historic Structures Report in response to public comments received on the Draft Environmental Impact Report for the Orange Coast College Vision 2020 Master Plan.

The College was founded in 1948 and the significant buildings were constructed between 1950 and 1957. The buildings within the Historic District were all designed by Master Architects Richard Neutra and Robert E. Alexander with Garrett Eckbo providing landscape design services. The buildings that remain-three classroom/lab complexes, a Planetarium, the Moore Theater, Music Building, Swimming Pool, Stadium and Field House- are exemplary of the design and planning approach of Neutra and Alexander during their decade-long partnership.

As noted above, the Preservation Alternatives presented here are provided to assist OCC in finding new uses for the historic fabric in order to avoid demolition as identified in the Vision 2020 Master Plan.

BUILDINGS AND SETTING

The original campus buildings remain recognizable and their surrounding landscape appropriate, although the later infill of Building 10 and additions to Building 14 do mar the open space between the complexes. Later development of the campus primarily took place outside of the Historic District boundaries keeping intact the pedestrian scale of the Neutra/Alexander structures at the center of the campus. Currently, multi-story complexes are in design or construction and these have all been sited further beyond the central core of the Historic District.

CHARACTER DEFINING FEATURES

The Neutra/Alexander classroom complexes have a number of shared character defining features which include:

- One story massing set at 45-degrees off north
- Two linear, rectangular classroom buildings separated by breezeway/patio
- Low pitched roofs
- Aluminum window walls canted outwards on low brick walls at north façades
- Solid walls with door openings and clerestory windows at south façades
- Solid east and west walls
- Mixed-use department-specific buildings south of the linear structures connected by covered walkways
- Covered walkway between the linear classroom and mixed-used department specific buildings
- Covered walkways and breezeways with overlapping planes
- Landscaped features include:
    - Brick screen and wing walls
    - Paved patio/courtyard spaces adjacent to buildings
    - Brick and concrete planters

For additional information on character defining features for individual buildings and the Historic District see 'Developmental History', Part 1 of the HSR.

ACCESSIBILITY

All proposed alternatives assume non-compliant accessibility issues will be addressed. These include but are not limited to new restroom facilities, door closure speeds, door force, and signage.

SUPPLEMENTAL INVESTIGATIONS

As part of the project, consultants were retained by Page & Turnbull to investigate the existing conditions of the historic buildings and to make recommendations for their continued use. These include:

- Structural Systems and Seismic Safety
- Mechanical, Electrical, Plumbing
- Fire, Life Safety and Code
- Hazardous Materials
- Cost Estimating

The reports can be found in the subsequent appendices.

PAGE INTENTIONALLY LEFT BLANK

SECRETARY OF THE INTERIOR'S STANDARDS

The Secretary of the Interior's Standards for Rehabilitation & Guidelines for Rehabilitating Historic Buildings (Standards) provide guidance for reviewing proposed work on historic properties, with the stated goal of making possible "a compatible use for a property through repair, alterations, and additions while preserving those portions or features which convey its historical, cultural, or architectural values."[3] The Standards are used by Federal agencies in evaluating work on historic properties. The Standards have also been adopted by local government bodies across the country for reviewing proposed rehabilitation work on historic properties under local preservation ordinances. The Standards are a useful analytical tool for understanding and describing the potential impacts of substantial changes to historic resources. Projects that comply with the Standards benefit from a regulatory presumption that they would have a less-than-significant adverse impact on a historic resource.[4] Projects that do not comply with the Standards may cause either a substantial or less-than-substantial adverse change in the significance of a historic resource.

The Standards offer four strategies to guide the treatment of historic properties: Preservation, Rehabilitation, Restoration, and Reconstruction. The four distinct treatments are defined as follows:

> **Preservation:** The Standards for Preservation "require retention of the greatest amount of historic fabric, along with the building's historic form, features, and detailing as they have evolved over time."
>
> **Rehabilitation:** The Standards for Rehabilitation "acknowledge the need to alter or add to a historic building to meet continuing new uses while retaining the building's historic character."
>
> **Restoration:** The Standards for Restoration "allow for the depiction of a building at a particular time in its history by preserving materials from the period of significance and removing materials from other periods."
>
> **Reconstruction:** The Standards for Reconstruction "establish a limited framework for recreating a vanished or non-surviving building with new materials, primarily for interpretive purposes."

---

3 National Park Service, *The Secretary of the Interior's Standards for Treatment of Historic Properties*, accessed on-line at http://www.nps.gov/tps/standards.html on April 1, 2015.

4 California Environmental Quality Act (CEQA) Guidelines 15064.5(b)(3).

Typically, one set of standards is chosen for a project based on the project scope. In this case, the proposed project scope is seeking to alter and add to historic properties to continue their existing use and also to preserve the Stadium (Bldg. 105) and Theater (Bldg. 2). Therefore, the Standards for Rehabilitation and Standards for Preservation will be applied to the Historic District.

Standards for Rehabilitation

The following analysis applies the Standards for Rehabilitation to the proposed project at Orange Coast College. The analysis considers the entire site to be the historic resource, against which the impact of changes in the proposed project will be measured.

This analysis is based upon the proposed project as described above.

Rehabilitation Standard 1: A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces, and spatial relationships.

Rehabilitation Standard 2: The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize the property will be avoided.

Rehabilitation Standard 3: Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other historical properties, will not be undertaken.

Rehabilitation Standard 4: Changes to a property that have acquired significance in their own right will be retained and preserved.

Rehabilitation Standard 5: Distinctive materials, features, finishes and construction techniques or examples of craftsmanship that characterize a property will be preserved.

Rehabilitation Standard 6: Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature will match the old in design, color, texture, and, where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.

Rehabilitation Standard 7: Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.

Rehabilitation Standard 8: Archaeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measure will be undertaken.

Rehabilitation Standard 9: New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work shall be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and environment.

Rehabilitation Standard 10: New additions and adjacent or related new construction will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

Standards for Preservation

The Standards for Preservation shall be applied to the Stadium (Bldg. 105) and the Theater (Bldg. 2). The Standards for Preservation state that a property will be used as it was historically, or be given a new use that maximizes the retention of distinctive materials, features, spaces, and spatial relationships. Where a treatment and use have not been identified, a property will be protected and, if necessary, stabilized until additional work may be undertaken.

The historic character of a property will be retained and preserved. The replacement of intact or repairable historic materials or alteration of features, spaces, and spatial relationships that characterize a property will be avoided.

Each property will be recognized as a physical record of its time, place, and use. Work needed to stabilize, consolidate, and conserve existing historic materials and features will be physically and visually compatible, identifiable upon close inspection, and properly documented for future research.

Changes to a property that have acquired historic significance in their own right will be retained and preserved.

Distinctive materials, features, finishes, and construction techniques or examples of craftsmanship that characterize a property will be preserved.

The existing condition of historic features will be evaluated to determine the appropriate level of intervention needed. Where the severity of deterioration requires repair or limited replacement of a distinctive feature, the new material will match the old in composition, design, color, and texture.

Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.

Archaeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.

APPROACH

PAGE INTENTIONALLY LEFT BLANK

APPROACH

RESOURCES

Potential programmatic elements were discussed during project meetings with OCC and CCCD. Additional program information for Dance was provided by HPI Architects, Inc.

Page & Turnbull reviewed the following documents in preparation of the Preservation Alternatives:

- Academic Master Plan
- Vision 2020 Facilities Master Plan
- Brailsford & Dunlavey Programming Presentations
- California Community Colleges FUSION Database including: Five-Year Capital Plan, Report 17, Initial Project Proposals, and Final Project Proposals

EXISTING USE AND PROGRAM

- Building 7: Student Success Center
- Buildings 8 & 9: Classrooms
- Buildings 12-14: Continues to function for the Business Department
- Buildings 35 & 36: Math instruction
- Building 37: College Reprographics Department
- Building 39: The Planetarium is unoccupied
- Building 93: Community Pool
- Building 110: Field House- continued use as offices for coaches and SWAP Meet, plus restroom facilities, information booth and Pirate Store to support events at the field

MASTER PLAN PROPOSAL AND ITS IMPACT

The Vision 2020 Facilities Master Plan, prepared by Cambridge West Partnership, LLC/HPI Architects, proposes all existing functions of the historic buildings will be relocated to newly constructed or renovated facilities. New uses for the historic buildings were not identified, instead the master plan calls for "…the vast majority of older 1950s campus facilities (row buildings) [to be] replaced with larger, more efficient structures."[3]

NEW USE CONSIDERATIONS

The College informed Page & Turnbull they could not accommodate any additional classroom use. Review of capacity/load ratios within the FUSION database confirmed this. At the same time Page & Turnbull discovered that according to the FUSION data, future construction at OCC would not impact the capacity to build:

- Laboratory
- Library/Study
- AV/TV

While considering the above constraints, Page & Turnbull endeavored to identify reuse options and select viable alternatives that would complement the Vision 2020 Facilities Master Plan and support OCC's mission. Program considerations were limited and not exhaustive:

Campus Related Uses

- Planetarium Support Spaces
- Study or Student Spaces
- Veterans' Center
- Vocational Rehab Center
- Student Success Center
- Community/Continuing Education
- Honors Program
- Adaptive PE (for Pool)
- Administration
- Faculty House
- Faculty in Residence
- Food Services
- Internship Academy
- Job Center
- Makerspace
- Dance Department
- Bike Sharing
- Special Services
- Joint Venture Uses
- Daycare Center
- L-SBE Incubator
- Small Conference Center
- Charter School
- ASU/Other Remote Campus
- Community Center
- Special Event Space
- Museum

CAMPUS ZONING

The new uses proposed for the historic buildings are compatible with the Campus Zoning defined in the Vision 2020 Facilities Master Plan for OCC. Retention of these buildings helps create a connection between some zones which have overlapping functions, for example, the Makerspace is an interdisciplinary space, and to foster interaction between Career Technology Education (CTE), Science, and Art to name a few.

SITE AND LANDSCAPE

The continued use of the historic buildings will enhance the "…hierarchy of outdoor rooms and spaces defined and connected by pedestrian spines, landscape and other pedestrian amenities." These buildings already present a "…human scale of space, and provide opportunities for intimate courts and plazas directly related to buildings".[4] The original landscape envisioned by Garrett Eckbo included an east-west pedestrian circulation path connecting all three academic complexes. The path was interrupted by outdoor rooms adjacent to each complex and supplemented with interval points between the complexes along with pathways on a diagonal to connect various parts of the campus. Although much of Eckbo's work was not installed, the intention of his

3 Cambridge Partnership LLC & HIll Partnership Inc., *Vision 2020 Facilities Master Plan*, May 2011: p. 92

4 Cambridge Partnership LLC & HIll Partnership Inc., *Vision 2020 Facilities Master Plan*, May 2011: p. 92

APPROACH

conceptual pan can still be seen today in the remnants of paths that remain. Reconstruction of the originally planned Eckbo path along the east-west shall be provided as part of all alternatives.

REHABILITATION REQUIREMENTS

In order to accommodate the proposed uses the buildings will need to be renovated and brought into compliance with the California Building Standards Code. Upgrades of mechanical, electrical, plumbing, low voltage, and fire protection services will be required. See MEP Evaluation (Appendix 4) for additional information. A seismic upgrade was completed on Buildings 12-13 in the late 1990s. The remaining buildings will require structural upgrades and strengthening, see Structural Evaluation (Appendix 3) for additional information.

It is expected that rehabilitation work would use the Secretary of the Interior's Standards for the Treatment of Historic Properties in determining appropriate measures in maintaining the historic integrity of the building and its character-defining features.

SUMMARY AND RECOMMENDATIONS

The following proposed alternatives have been provided as examples of how the existing buildings could continue to be useful to the College. These options were presented to CCCD Board of Trustees and OCC on March 18, 2015. It should be noted that the proposed functions could be interchangeable or replaced with other uses as determined necessary by the College and CCCD.

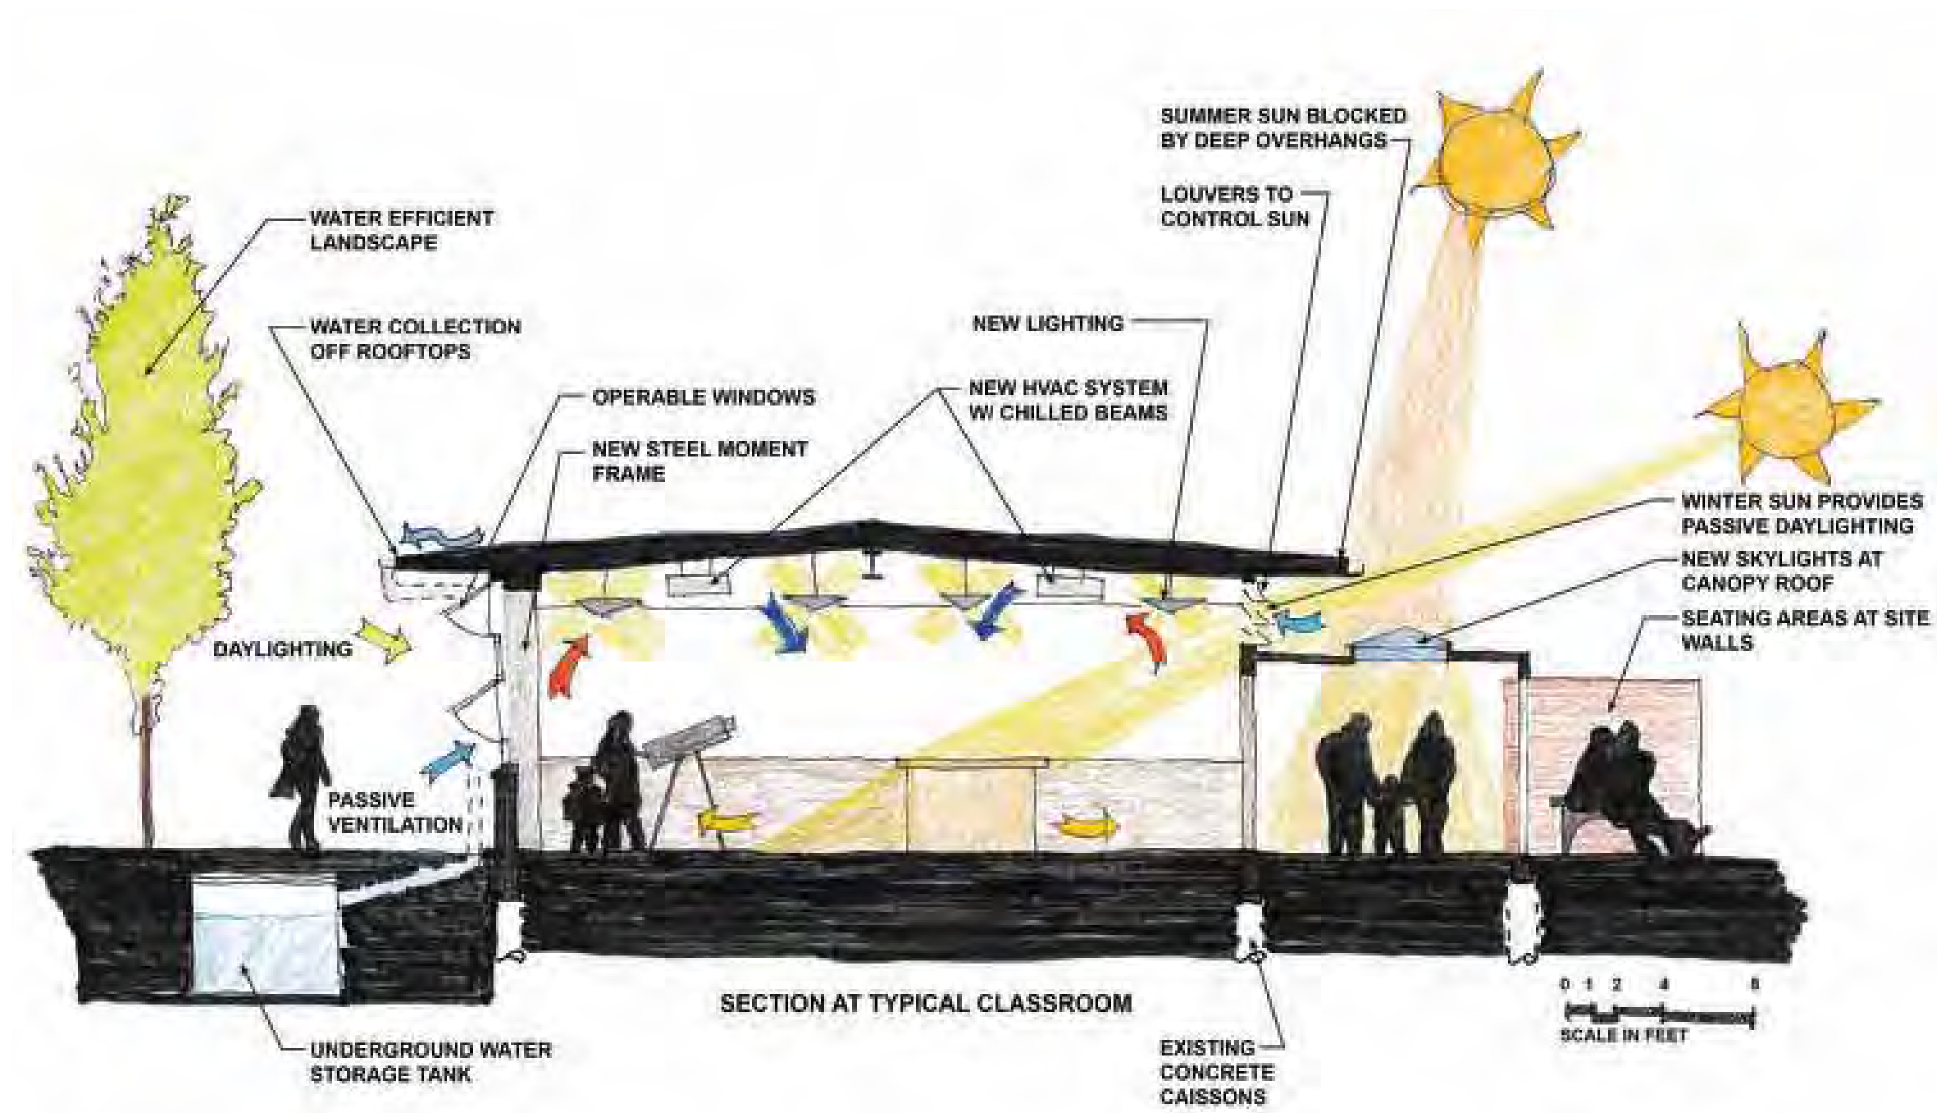
The Preservation Alternatives give a general breakdown of possible program spaces and provide a graphic representation of each option. In order to determine general program requirements various assumptions have been made based on Page & Turnbull's experience with similar issues on similar projects.

It is recommended that further development of the proposed alternatives be prepared through standard architectural programming services to include discussions with College users and stakeholders to determine the best use for these buildings and specific room criteria for each space. The proposed alternatives shall be interpreted as conceptual only.

The future design team shall ultimately be responsible for reviewing all information as well as providing a due-diligence effort to determine a program and design solution. The reviewing agencies and governing authorities will also make a determination on what will be required for the alterations on a case-by-case basis.

TYPICAL CLASSROOM SECTION

The section below through a typical classroom building shows how existing building features and new systems such as skylights at covered walkways and chilled beams as part of a new HVAC system can help the building meet OCC's sustainability objectives.



SECTION AT TYPICAL CLASSROOM

PRESERVATION ALTERNATIVE 1

PAGE INTENTIONALLY LEFT BLANK

PRESERVATION ALTERNATIVE 1A

Preservation Alternative 1A is the maximum reuse alternative. The new Planetarium is relocated to outside the Historic District's north boundary to avoid demolishing contributing buildings. Buildings north of the Historic District constructed between 1958 and 1964 will be demolished to allow for the new Planetarium and to connect the Historic District to new classroom buildings under construction. Within the Historic District, non-contributing buildings and additions made after 1957 will be removed to restore the most complete example of the Historic District, including an east-west axis that has been disrupted by non-contributors. The historic buildings will be rehabilitated in conformance with the Secretary of the Interior's Standards for Rehabilitation (Standards). The original classroom buildings will be adaptively reused for administrative services, Special Services and the Honors Program, and as an interdisciplinary center shared by the Science, Architecture, and Art Departments as well as student and community facilities. The Theater and Music Buildings (Bldgs. 2 and 4) will retain their current use. Minor and sensitive alterations to character-defining features are proposed, such as skylights at the covered walkways and upgrades to structural systems to increase seismic resistance. The estimated cost for Alternative 1A is approximately $30 million.

ALTERNATIVE 1A COST SUMMARY

Building	Proposed Use	Total Project Cost at Each Complex
Buildings 2 and 4	Unchanged - Robert Moore Theater and Music Building	$1,846,750
Buildings 7-9	Administrative Services	$6,164,500
Buildings 12-14	Special Services and Honors	$9,994,000
Buildings 35-39	Interdisciplinary Center	$6,070,125
Building 93	Community or Adaptive PE Pool with New Support Building	$3,421,625
Building 105	Unchanged - LeBard Stadium	$313,875
Building 110	Athletic Support and Restrooms	$1,278,500
Building 10	Existing Special Services (**Demolition**)	$652,500
	Alternative 1A Total Project Cost	**$29,741,875**

Note: The cost for Buildings 12-14 includes an option for a central plant, estimated at approximately $2,000,000.

Caveat Emptor: Cost Summary is based on Page & Turnbull's Scope of Work only and does not include related work as defined by CCCD.

PRESERVATION ALTERNATIVE 1B

Alternative 1B is the same as Alternative 1A, except the Swimming Pool complex (Bldg. 93) and Field House (Bldg. 110) are removed to allow the College to focus its resources on preserving the core of the Historic District. Although this alternative does not fully comply with the Standards, the loss of the discontiguous Swimming Pool complex (Bldg. 93) does not affect the Historic District's ability to convey its significance to the extent that it is no longer eligible for historic listing. The Stadium remains as an athletic component of the Historic District, even without the Field House (Bldg. 110). The estimated cost for Alternative 1B is approximately $25 million. Alternative 1B is the recommended alternative.

ALTERNATIVE 1B COST SUMMARY

Building	Proposed Use	Total Project Cost at Each Complex
Buildings 2 and 4	Unchanged - Robert Moore Theater and Music Building	$1,846,750
Buildings 7-9	Administrative Services	$6,164,500
Buildings 12-14	Special Services and Honors	$9,994,000
Buildings 35-39	Interdisciplinary Center	$6,070,125
Building 93	Existing Swimming Pool Complex (**Demolition**)	$161,750
Building 105	Unchanged - LeBard Stadium	$313,875
Building 110	Existing Field House (**Demolition**)	$219,375
Building 10	Existing Special Services (**Demolition**)	$652,500
	Alternative 1B Total Project Cost	**$25,422,875**

Note: The cost for Buildings 12-14 includes an option for a central plant, estimated at approximately $2,000,000.

PRESERVATION ALTERNATIVES 1A & 1B: CENTRAL CORE

ALTERNATIVE 1

PRESERVATION ALTERNATIVES 1A & 1B
BUILDINGS 7-9: ADMINISTRATIVE SERVICES

Additions to Building 7 shall be removed as part of the rehabilitation and restoration work planned for the original Library, returning Buildings 7-9 to their original condition. The primary occupant proposed for Alternative 1A & 1B at Buildings 7-9 is College Administration Services.

New, expanded restroom facilities which meet current California Building Standards Code requirements for fixture count and accessibility shall be located at existing plumbing locations.

A small Food Service room open to everyone on campus and a Breakroom for Administration are needed which will require additional plumbing. Special power requirements may be necessary for Food Service.

Reconstruction of the original Library Fireplace has been proposed for the programmed location for the President's Office Suite and restoration of historic finishes at the covered walkways and breezeways.

Small skylights at the existing covered walkways and additional exterior lighting are proposed as a minor, reversible alteration to address the College's concern that these pedestrian pathways are too dark.

Structural system upgrades are necessary to enhance the buildings' seismic performance. Buildings 8 and 9 require a new moment frame system to be constructed at the interior of the window walls and Building 7 needs revisions to its shear wall system. See Structural Evaluation (Appendix 3) for more information.

Mechanical, Electrical and Plumbing upgrades will be necessary and descriptions can be found in the MEP Evaluation (Appendix 4).

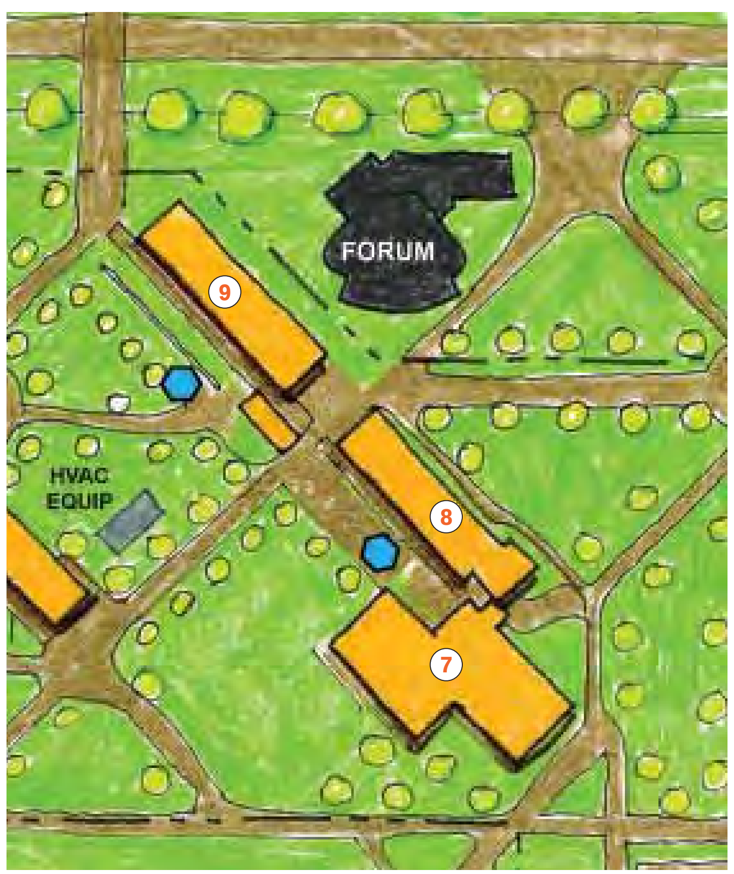
Figure 12: Buildings 7 & 8 - Outdoor Room, ca.1951; Robert Evans Alexander papers, #3087. Division of Rare and Manuscript Collections, Cornell University Library.

REHABILITATION AT BUILDINGS 7 & 8 PLAZA

The landscaped plaza between Buildings 7 and 8 will become the focal point for the complex, welcoming visitors to the campus' oldest remaining building. The plaza will be rehabilitated to provide more shade and seating areas. At some of the Alternatives, the hardscape may be extended to the south and west to create more generous location for outdoor activities and events.



PRESERVATION ALTERNATIVES 1A & 1B
BUILDINGS 12-14: STUDENT & SPECIAL SERVICES

Probably the most important work needed at the Business Education complex is to remove non-contributor additions to Building 14 and reconstruct the display window on the south wall.

With the removal of Special Services Building 10, new program functions for Buildings 12 and 13 will provide a new home for Special Services. Other program uses include a location for the Honors Program in Building 14 and shared student functions such as a Study Room and Lounge. Day use lockers have been requested by students in surveys conducted by others and therefore they have been proposed to be located within the Student Lounge.

New, expanded restroom facilities which meet current California Building Standards Code requirements for fixture count and accessibility shall be located at existing plumbing locations.

A small Food Service room open to everyone on campus will require additional plumbing. Special power requirements may also be necessary.

Historic finishes at the covered walkways and breezeways shall be restored and small skylights additional exterior lighting are proposed as a minor, reversible alteration to address the College's concern that these pedestrian pathways are too dark.

Structural system upgrades were constructed as part of earlier efforts to address seismic issues at Buildings 12 and 13. Because of the significant work necessary to recreate Building 14 further study may be necessary. Interior shear walls where new door openings are proposed will require shotcrete for strengthening. See Structural Evaluation (Appendix 3) for more information.

Mechanical, Electrical and Plumbing upgrades will be necessary and descriptions may be found in the MEP Evaluation (Appendix 4).

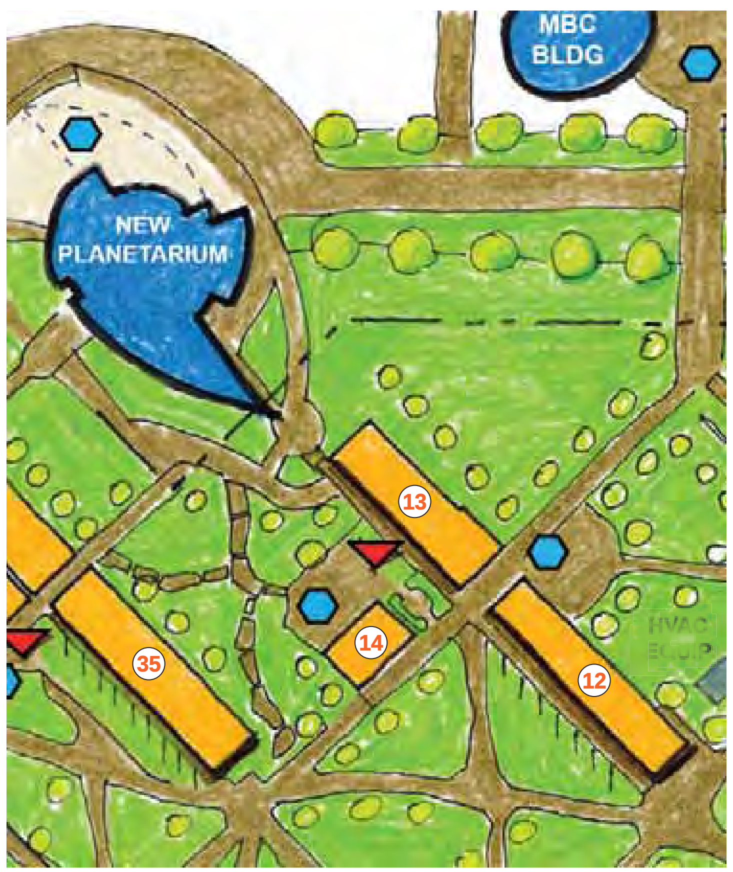
Figure 20: View of Building 14 addition from covered walkway, 2015. Source: Page & Turnbull.

REHABILITATION AT BUILDING 14 QUAD

A significant opportunity for a signature outdoor campus space is possible with the removal of the 1970s addition to Building 14. To the west of Building 14, a new hardscape plaza is conceived as both a central campus node and connective tissue between Buildings 12-14 and 35-39. Programming at Building 14 will be able to take advantage of this outdoor space for receptions and special campus events. The plaza will provide multi-functional space that can be set-up with chairs for performances or tables and chairs for receptions. Landscape will include new shade trees and plantings.

Activity generated in this new plaza space will benefit the new Planetarium in the Alternatives where it is relocated to the north of Building 36. The new Planetarium and plaza to the west of Building 14 will act in unison to energize the campus core.



PRESERVATION ALTERNATIVES 1A & 1B
BUILDINGS 35-39: INTERDISCIPLINARY CENTER

Non-contributor additions to Buildings 37 and 39 shall be removed as part of the rehabilitation and restoration work planned for the original Science complex. The key function of Buildings 35-39 is as an Interdisciplinary Center. To support this a large Makerspace is proposed for Building 37 and a large Multipurpose Room will support it and the campus as a whole. Science support spaces focused on the functions planned for the new Planetarium will provide storage for the Astronomy Department's telescopes and a classroom for K-12 visitors attending a demonstration/show at the Planetarium.

A number of shared student functions are proposed: Study Room, Lounge, Meditation Room and Bike Sharing. Together with the Makerspaces this complex has an opportunity to bring together many departments from around campus to engage in learning together.

New, expanded restroom facilities which meet current California Building Standards Code requirements for fixture count and accessibility shall be located at existing plumbing locations.

A small Food Prep room open to everyone on campus will require additional plumbing. Special power requirements may also be necessary. It is also proposed that a more significant Food Service operate in the old Planetarium (Bldg. 39)

Historic finishes at the covered walkways and breezeways shall be restored and small skylights and additional exterior lighting are proposed as a minor, reversible alteration to address the College's concern that these pedestrian pathways are too dark.

Structural system upgrades may be necessary for Building 36 and new openings at bearing walls of Building 37 will require structural interventions. See Structural Evaluation (Appendix 3) for more information.

Mechanical, Electrical and Plumbing upgrades will be necessary and descriptions may be found in the MEP Evaluation (Appendix 4).

MATH AND PLANETARIUM COMPLEX REHABILITATION

(New Planetarium in background)

To provide direct access from the south part of campus and parking, a portion of the north and south walls of Building 36, will be removed to provide a direct pedestrian path to the new Planetarium. To strengthen this axis, a new plaza is recommended for the space between Buildings 37 and 39. This plaza will help funnel people through Building 36 to the new Planetarium. The plaza will also provide a meeting and gathering space for school and community groups arriving on campus. A small food service facility in Building 39 will open directly onto this new entry plaza. The plaza will be landscaped to include benches and shade trees. The original reflecting pool at the southwest corner of Building 39 may be restored to provide an additional amenity to this complex.

PRESERVATION ALTERNATIVE 1A
BUILDING 93: COMMUNITY POOL *(Alternative 1A only)*

Proposed new use for the Swimming Pool complex is to rehabilitate the Pools for the community. This will require locker rooms, lobby, food service or vending, and a new pool equipment room.

Bleachers require repairs and are in need of disabled access. The pools will need accessibility lifts.

See Structural and MEP Evaluations (Appendices 3 & 4) for additional information.

PRESERVATION ALTERNATIVE 1C

In response to comments from the College staff, Alternative 1C retains the Special Services Building (Bldg. 10) as well as non-contributing additions at Building 7. The rest of the alternative is similar to Alternative 1B. With Special Services remaining in Building 10, part of Building 7 is adaptively reused as a theater pre-function space. Alternative 1C will not restore the east-west axis that was a key part of the original circulation pattern in the Historic District, but the district will retain its eligibility for historic listing. The estimated cost for Alternative 1C is approximately $26 million.

ALTERNATIVE 1C COST SUMMARY

Building	Proposed Use	Total Project Cost at Each Complex
Buildings 2 and 4	Unchanged - Robert Moore Theater and Music Building	$1,846,750
Buildings 7-9	Administrative Services and Theater Prefunction	$7,292,000
Buildings 12-14	Student and Community Functions	$10,032,875
Buildings 35-39	Interdisciplinary Center	$6,070,125
Building 93	Existing Swimming Pool and Bleachers (**Demolition**)	$161,750
Building 105	Unchanged - LeBard Stadium	$313,875
Building 110	Existing Field House (**Demolition**)	$219,375
Building 10	To Remain. Not in Scope of Work for Planning or Cost Estimating	
	Alternative 1C Total Project Cost	**$25,936,750**

Note: The cost for Buildings 12-14 includes an option for a central plant, estimated at approximately $2,000,000.

Caveat Emptor: Cost Summary is based on Page & Turnbull's Scope of Work only and does not include related work as defined by CCCD.

PRESERVATION ALTERNATIVE 1C: CENTRAL CORE

PRESERVATION ALTERNATIVE 1C
BUILDINGS 7-9: ADMINISTRATIVE SERVICES & THEATER PRE-FUNCTION ROOM

East and west additions to Building 7 shall be retained as part of the rehabilitation and restoration work planned for the original Library, therefore allowing for the building to accommodate both Administrative functions as in Alternative 1B and a new Pre-Function space to support the Theater Arts programs. The addition at the south side of Building 7 is to be razed.

New, expanded restroom facilities which meet current California Building Standards Code requirements for fixture count and accessibility shall be located at existing plumbing locations.

A small Food Service room open to everyone on campus and a Breakroom for Administration are needed which will require additional plumbing. Special power requirements may be necessary for Food Service.

Reconstruction of the original Library fireplace has been proposed for the programmed location for the President's Office Suite and restoration historic finishes at the covered walkways and breezeways shall be restored.

Small skylights at the existing covered walkways and additional exterior lighting are proposed as a minor, reversible alteration to address the College's concern that these pedestrian pathways are too dark.

Structural system upgrades are necessary to enhance the buildings' seismic performance. Buildings 8 and 9 require a new moment frame system to be constructed at the interior of the window walls and Building 7 needs revisions to its shear wall system. See Structural Evaluation (Appendix 3) for more information.

Mechanical, Electrical and Plumbing upgrades will be necessary and descriptions may be found in the MEP Evaluation (Appendix 4).

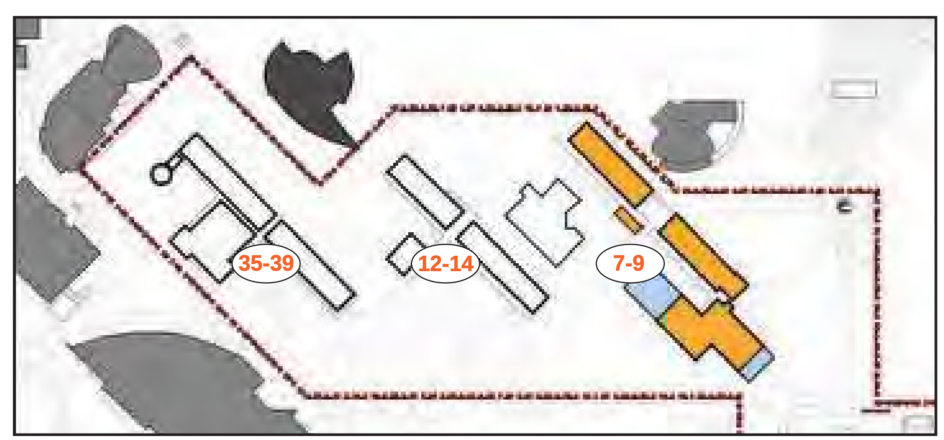
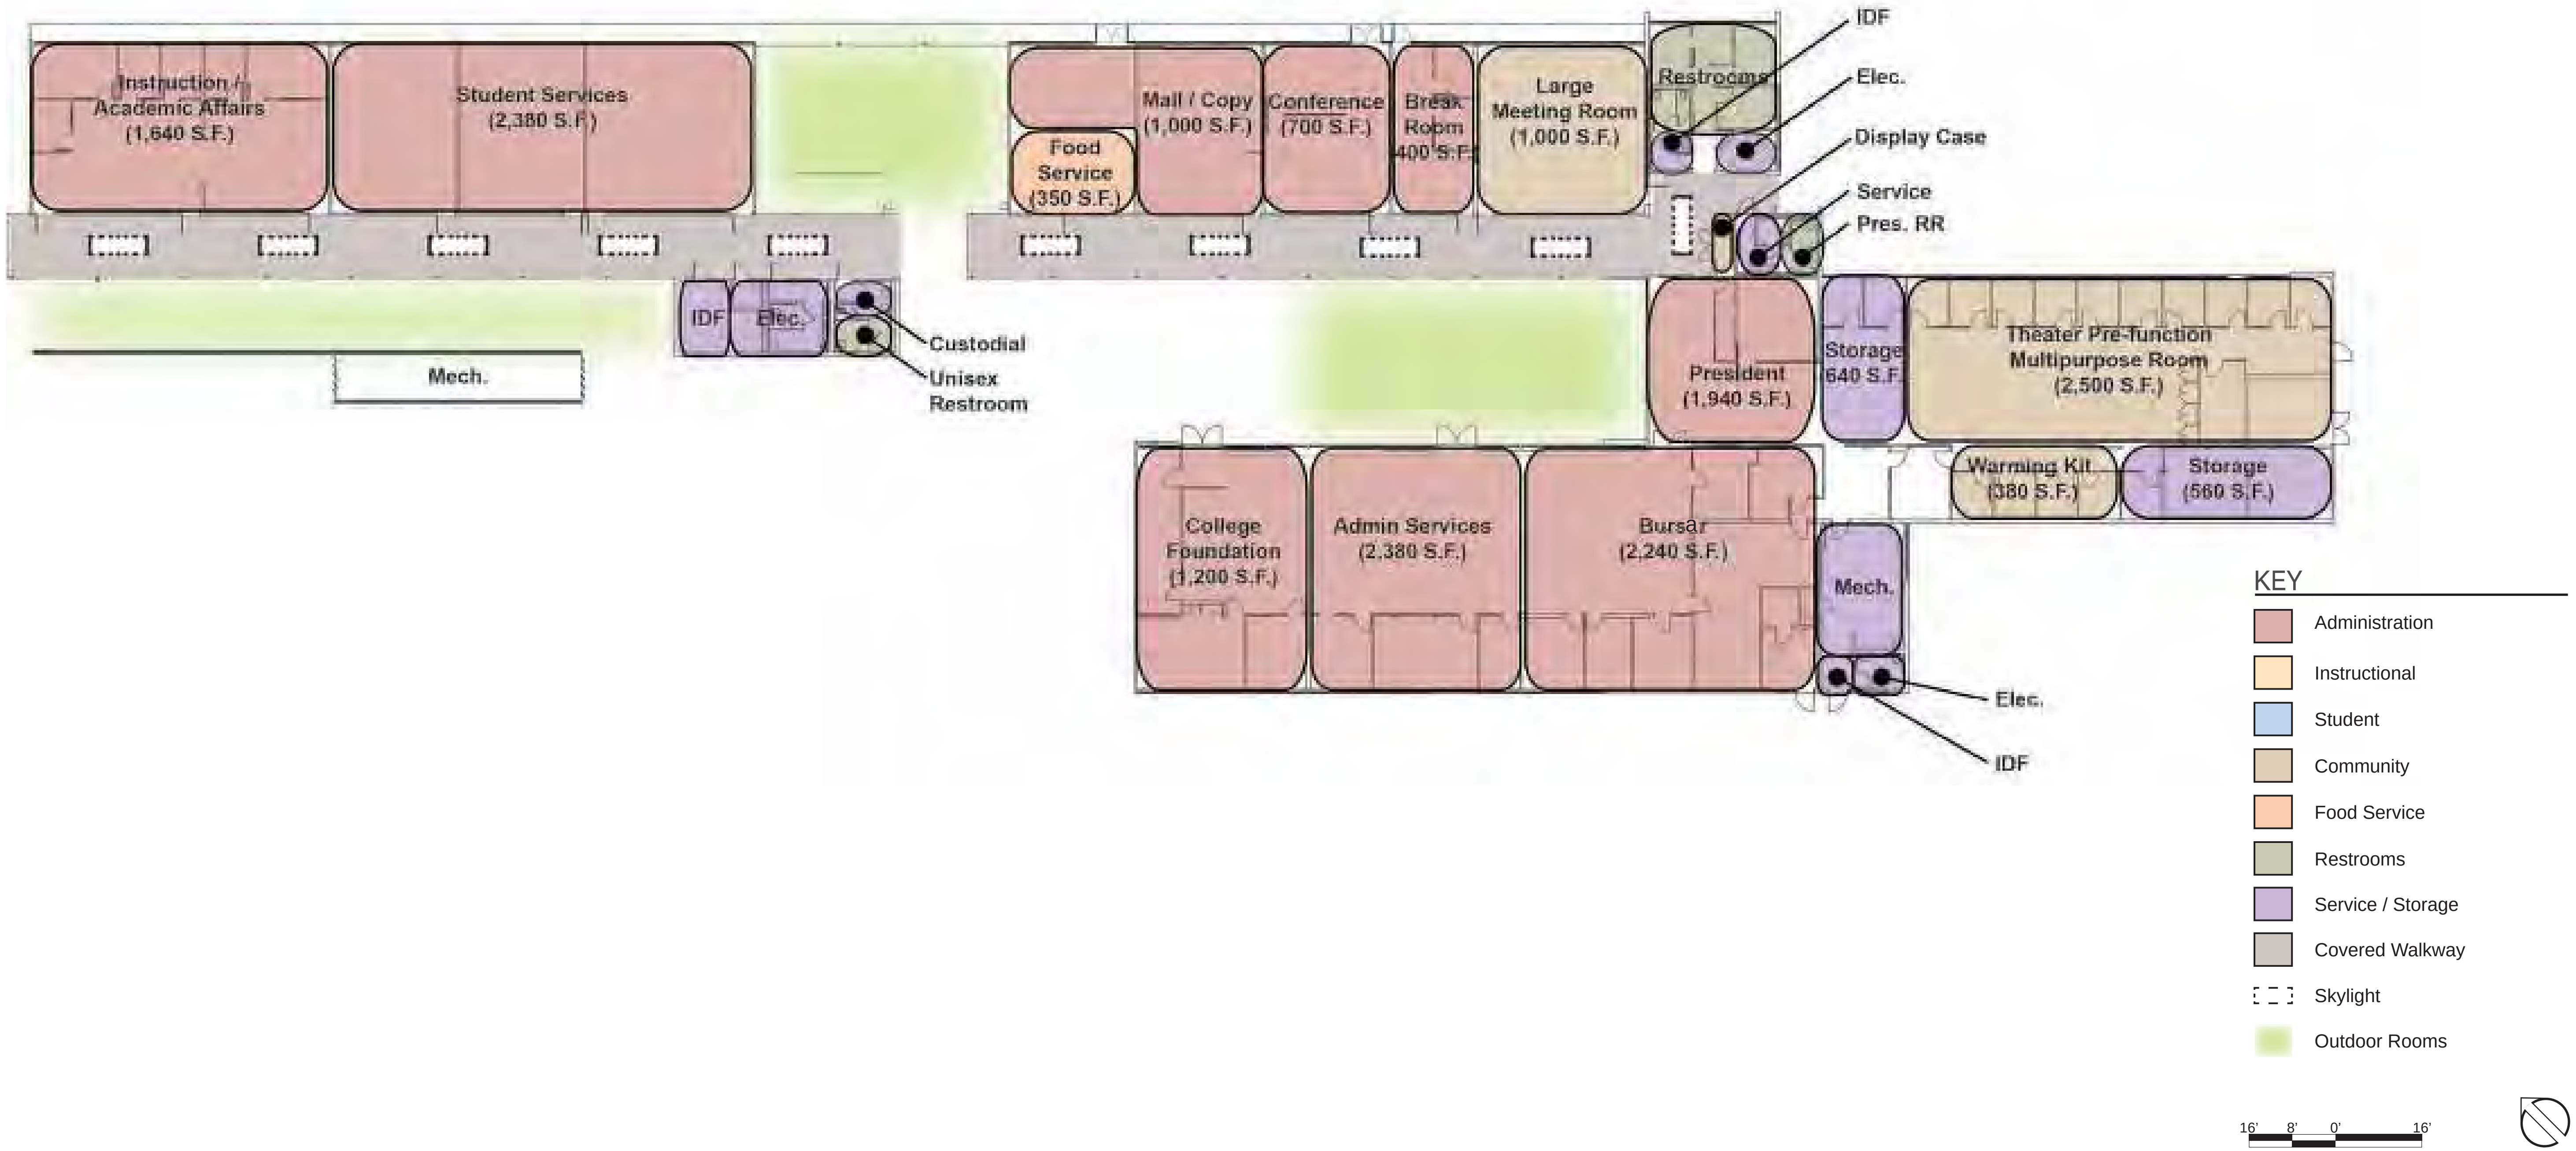
KEY PLAN



PRESERVATION ALTERNATIVE 1C
BUILDINGS 7-9: ADMINISTRATIVE SERVICES & THEATER PRE-FUNCTION ROOM



PRESERVATION ALTERNATIVE 1C
BUILDINGS 12-14: STUDENT & COMMUNITY USE

Probably the most important work needed at the Business Education complex is to remove non-contributor additions to Building 14 and reconstruct the display window on the south wall.

New program functions proposed for Buildings 12-14 in Alternative 1C are focused on community engagement: Community Lecture Space, Museum and Community Sustainability Lab will provide numerous opportunities for OCC to engage both campus and community.

Shared student functions are included as a Study Room and Lounge. Day use lockers have been requested by students in surveys conducted by others and therefore they have been proposed to be located within the Student Lounge.

New, expanded restroom facilities which meet current California Building Standards Code requirements for fixture count and accessibility shall be located at existing plumbing locations.

A small Food Service room open to everyone on campus will require additional plumbing. Special power requirements may also be necessary.

Historic finishes at the covered walkways and breezeways shall be restored and small skylights additional exterior lighting are proposed as a minor, reversible alteration to address the College's concern that these pedestrian pathways are too dark.

Structural system upgrades were constructed as part of earlier efforts to address seismic issues at Buildings 12 and 13. Because of the significant work necessary to restore Building 14 further study may be necessary. Interior shear walls where new door openings are proposed will require shotcrete for strengthening. See Structural Evaluation (Appendix 3) for more information.

Mechanical, Electrical and Plumbing upgrades will be necessary and descriptions may be found in the MEP Evaluation (Appendix 4).

ALTERNATIVE 1

PRESERVATION ALTERNATIVE 1C
BUILDINGS 35-39: INTERDISCIPLINARY CENTER

Non-contributor additions to Buildings 37 and 39 shall be removed as part of the rehabilitation and restoration work planned for the original Science complex. The key function of Buildings 35-39 is as an Interdisciplinary Center. To support this a large Makerspace is proposed for Building 37 and a large Multipurpose Room will support it and the campus as a whole. Science support spaces focused on the functions planned for the new Planetarium will provide storage for the Astronomy Department's telescopes and a classroom for K-12 visitors attending a demonstration/show at the Planetarium.

A number of shared student functions are proposed: Study Room, Lounge, Meditation Room and Bike Sharing. Together with the Makerspaces this complex has an opportunity to bring together many departments from around campus to engage in learning together.

New, expanded restroom facilities which meet current California Building Standards Code requirements for fixture count and accessibility shall be located at existing plumbing locations.

A small Food Prep room open to everyone on campus will require additional plumbing. Special power requirements may also be necessary. It is also proposed that a more significant Food Service operate in the old Planetarium (Bldg. 39).

Historic finishes at the covered walkways and breezeways shall be restored and small skylights and additional exterior lighting are proposed as a minor, reversible alteration to address the College's concern that these pedestrian pathways are too dark.

Structural system upgrades may be necessary for Building 36 and new openings at bearing walls of Building 37 will require structural interventions. See Structural Evaluation (Appendix 3) for more information.

Mechanical, Electrical and Plumbing upgrades will be necessary and descriptions may be found in the MEP Evaluation (Appendix 4).

PAGE INTENTIONALLY LEFT BLANK

PRESERVATION ALTERNATIVE 2

PAGE INTENTIONALLY LEFT BLANK

PRESERVATION ALTERNATIVE 2A

Preservation Alternative 2A is considered a strategic reuse alternative where the new Planetarium remains at its proposed location and contributor Buildings 36, 37, and 39 are removed. While not preferred, it is in Page & Turnbull's opinion that an eligible historic district remains because sufficient buildings remain in the core of the Historic District to convey its significant spatial relationships. However, removal of any additional historic fabric beyond what has been identified in Preservation Alternative 2A would jeopardize the eligibility of the Historic District for historic listing.

Under Alternative 2A, the remainder of the Historic District will be restored to express its significance. Non-contributing buildings and additions made after 1957 within the Historic District will be removed to restore the spatial relationship as well as an east-west axis that has been disrupted by non-contributors. The Swimming Pool complex (Bldg. 93) and Field House (Bldg. 110) will be demolished. The remaining historic buildings will be rehabilitated in conformance with the Secretary of the Interior's Standards for Rehabilitation (Standards). The old Planetarium (Bldg. 39) will be relocated to a site yet to be determined and reused. The Theater and Music Buildings (Bldgs. 2 and 4) will retain their current use. Minor and sensitive alterations to character-defining features are proposed, such as skylights at covered walkways and upgrades to structural systems to increase seismic resistance. The estimated cost for Alternative 2A is approximately $23 million.

ALTERNATIVE 2A COST SUMMARY

Building	Proposed Use	Total Project Cost at Each Complex
Buildings 2 and 4	Unchanged - Robert Moore Theater and Music Building	$1,846,750
Buildings 7-9	Administrative and Special Services	$6,892,375
Buildings 12-14	Interdisciplinary Center	$10,028,375
Building 35 Only	Science Support and Community Functions	$2,499,000
Building 93	Existing Swimming Pool Complex (**Demolition**)	$161,750
Building 105	Unchanged - LeBard Stadium	$313,875
Building 110	Existing Field House (**Demolition**)	$219,375
Building 10	Existing Special Services (**Demolition**)	$652,500
	Alternative 2A Total Project Cost	**$22,614,000**

Note: The cost for Buildings 12-14 includes an option for a central plant, estimated at approximately $2,000,000.

Caveat Emptor: Cost Summary is based on Page & Turnbull's Scope of Work only and does not include related work as defined by CCCD.

ALTERNATIVE 2

PRESERVATION ALTERNATIVE 2B
BUILDINGS 7-9: DANCE DEPARTMENT & STUDENT USE

Thenorthwest adn southwest additions to Building 7 shall be removed to make way for a new addition to house the Dance Department. The southeast addition to Building 7 will be retained as part of the rehabilitation and restoration work planned for the original Library, and to provide appropriate sizing for dance studios.

The new addition will house the larger dance studios requested by the department as provided to Page & Turnbull by HPI Architects, Inc.

Besides being a new home for the Dance Department with closer adjacency to the Theater and Music Departments, Buildings 7-9 will also provide Student Spaces: Study Room, Lounge, and Meditation Room.

New, expanded restroom facilities which meet current California Building Standards Code requirements for fixture count and accessibility shall be located at existing plumbing locations.

A small Food Service room may require additional plumbing and have special power requirements.

Reconstruction of the original Library fireplace has not been proposed because of the conflict with the Dance Studio function needed in that location.

Small skylights at the existing covered walkways and additional exterior lighting are proposed as a minor, reversible alteration to address the College's concern that these pedestrian pathways are too dark.

Structural system upgrades are necessary to enhance the buildings' seismic performance. Buildings 8 and 9 require a new moment frame system to be constructed at the interior of the window walls and Building 7 needs revisions to its shear wall system. See Structural Evaluation (Appendix 3) for more information.

Mechanical, Electrical and Plumbing upgrades will be necessary and descriptions may be found in the MEP Evaluation (Appendix 4).

BUILDINGS 12-14: INTERDISCIPLINARY CENTER

Probably the most important work needed at this complex is to remove non-contributor additions to Building 14 and reconstruct the display window on the south wall.

The key function of Buildings 12-14 is as an Interdisciplinary Center. To support this a large Makerspace is proposed at Building 12 and a large Multipurpose Room located at Building 14. The Honors Program will share Building 13 with a Study Room for the general student body. Together with the Makerspaces this complex has an opportunity to bring together many departments from around campus to engage in learning together.

New, expanded restroom facilities which meet current California Building Standards Code requirements for fixture count and accessibility shall be located at existing plumbing locations.

A small Food Service room open to everyone on campus will require additional plumbing. Special power requirements may also be necessary.

Historic finishes at the covered walkways and breezeways shall be restored and small skylights and additional exterior lighting are proposed as a minor, reversible alteration to address the College's concern that these pedestrian pathways are too dark.

Structural system upgrades were constructed as part of earlier efforts to address seismic issues at Buildings 12 and 13. Because of the significant work necessary to recreate Building 14 further study may be necessary. Interior shear walls where new door openings are proposed will require shotcrete for strengthening. See Structural Evaluation (Appendix 3) for more information.

Mechanical, Electrical and Plumbing upgrades will be necessary and descriptions may be found in the MEP Evaluation (Appendix 4).

BUILDING 35: SCIENCE SUPPORT & COMMUNITY USE

In order to accommodate the new Planetarium Buildings 36, 37, 38, and 39 must be removed. This reduces the area available for new program functions therefore spaces are focused on supporting the Planetarium and Sciences by providing a Visitor Classroom for K-12 Field Trips, storage for telescopes and a Multipurpose Room to be shared with the Community.

A small Food Service is proposed which may also be used by visitors to the New Planetarium and a Bike Sharing program would support OCC students. The Food Service area may require plumbing and have special electrical needs.

New, expanded restroom facilities which meet current California Building Standards Code requirements for fixture count and accessibility shall be located at existing plumbing locations.

Historic finishes at the covered walkways and breezeways shall be restored and small skylights and additional exterior lighting are proposed as a minor, reversible alteration to address the College's concern that these pedestrian pathways are too dark.

See Structural Evaluation (Appendix 3) for information about seismic upgrades.

college buildings: space analysis

The next nineteen pages of this issue are devoted to the subject of college buildings—and specifically, it so happens, buildings for junior colleges. The junior college is in one sense a "decapitation" of the full 4-year college, and in another, an upward growth from the high school—an extension of the secondary-school program. Its functions therefore can be several—continuing cultural education not carried to the full collegiate level, preprofessional or even preacademic training, or vocational schooling of perhaps a very specialized nature.

If the college and university building has been neglected in the United States until very recently, the junior college—a phenomenon entirely of the 20th century—has suffered even more. In most cases it has inherited structures either from a high school plant, or from a senior college. In their book "Planning Secondary School Buildings" (Reinhold—1949), Engelhardt, Engelhardt, and Leggett stated, ". . . it is quite the exception to find a junior college plant which was conceived, planned, and erected after a thorough-going survey which identified the particular purposes to be served in the local situation."

The two Junior Colleges shown on the following pages, then, are exceptions to the rule. For one of them—the Little Rock Junior College (pages 63-67)—was wholly planned from scratch. And, in the case of Orange Coast College (pages 68-79), while a few existing buildings were salvaged, the campus plan that was developed is essentially a brand new one. Determination of building needs, number of classrooms needed, of what type and size, etc., derived from findings drawn up in an extraordinary thorough-going, 106-page survey—"Report on a Development Plan and a Construction Program"—prepared for the college board by Robert E. Alexander, the architect, and his associates. The notes which follow are drawn from this study. Of particular interest is the method of determining space requirements and allocations—the number and sizes of classrooms and specialized spaces.

The first step in the study of space requirements for the campus at Orange Coast was a presentation by the faculty of its estimate, based on anticipated needs 15 years ahead. The architect then organized this tentative estimate, and compared it with an estimate of 1970 registration (based on data obtained from the county superintendent of schools—present high school enrollment, anticipated growth of the area, and anticipated growth through students from outside the area) to establish a working figure for ultimate (1970) enrollment. Classroom space was conceived as a strip 32' wide, divisible laterally into 16', 24', 32', or 40' rooms for offices, classrooms, and lecture rooms. Special spaces (drafting rooms, work shops, etc.) were conceived as wings on the other side of a connecting corridor. A figure of 34 sq. ft. per student was used for classrooms; and 100 sq. ft. or more in specialized spaces. Both classroom strip and shop wings would be arranged for expansion (see plan on page 73).

The method of calculating ultimate space requirements can be illustrated by examples taken from the development of the Technology Building illustrated in this issue. The steps were as follows:

1. The estimated 1970 enrollment was multiplied by the number of hours the class meets each week, to obtain estimated student hours per week, for each course. If the number of student hours was too large for one section, it was divided into two or more sections.

February 1952 61

"College Buildings: A Space Analysis." *Progressive Architecture* v.33 (USA: February, 1952): cover page and page 61. Source: Helen Topping Architecture & Fine Arts Library, University of Southern California.

2. The number of sections per class was multiplied by the number of class hours per week, to obtain the number of hours a given class would *use a classroom* each week.

3. This number of classroom hours per week was then divided by 24.5 (hours of possible multiple-use occupancy) to obtain the number of classrooms needed for each subject.

Examples of this procedure are indicated by the mathematics courses meeting in the Technology Building. Notice that in each case the hours per week times the number of sections times the class size equals the estimated total of student hours.

	Student Hours	Class Room			
		Hours Week	Number Sections	Size	Hours Used
Math A	140	4	1	35	4
B	105	3	1	35	3
C	105	3	1	35	3
D	240	4	2	30	8
2	90	3	1	30	3
3A	105	3	1	35	3
4A	90	3	1	30	3
50	90	3	1	30	3
51	90	3	1	30	3
52	70	2	1	35	2
					35

Since 35, divided by 24.5, gives a figure of 1.43 classrooms, it is apparent that these mathemat[ics] classes, in 1970, will require the use of 1 1/2 medium-sized classrooms, capable of containing 30-[35] students.

The same sort of analysis was made for specialized spaces, as the following illustration ind[i]cates:

	Student Hours	Class			Hours Used	
		Hours Week	No. Sections	Size	A	B
Metal Trades 51	405	15	1	27	14	1
Metal Trades 52	330	15	1	22	14	1
Metal Trades 55	150	5	1	30	5	
				79	33	2

In this tabulation, A is a specialized shop (see the building presentation that follows for an indi[ca]tion of the way this Metal Trades Shop was finally designed) and **B** is an ordinary classroom sp[ace] that would be required. Thus the 15 hours per week during which "Metal Trades 51" meets w[ould] be 14 hours in Shop (A) and one hour in a classroom (**B**). Furthermore, Shop would be use[d a] total of 33 hours a week, by an estimated 53 students (66 2/3% of the total enrollment of 79). T[he] Metal Trades shop, then, would require 51 x 100 sq. ft. of space, and would be used 33 hour[s a] week.

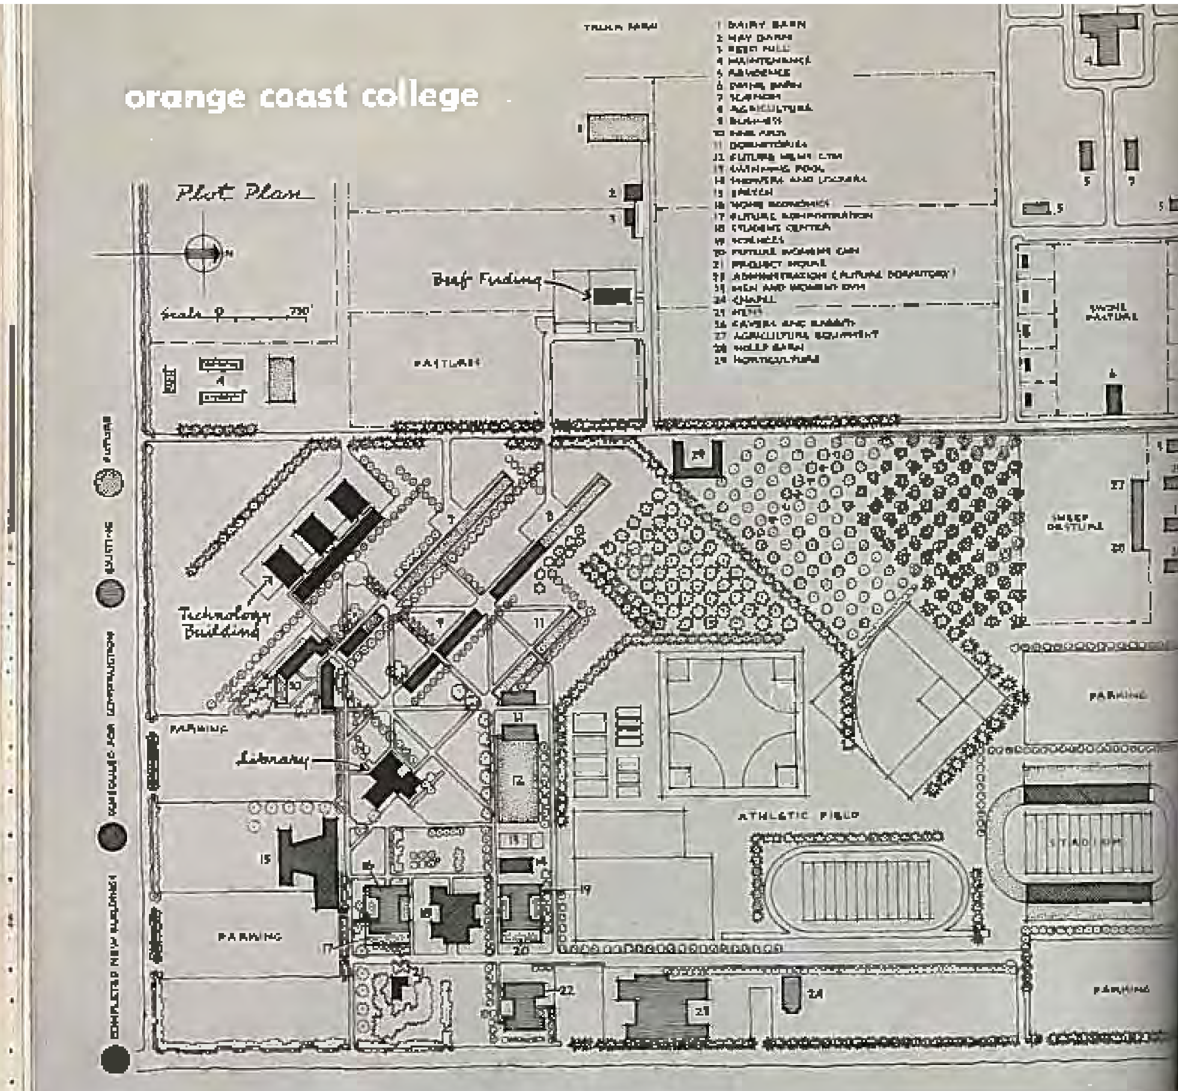
Too often, in an appraisal of architecture for education purposes, the final visual result [is] evaluated without an understanding of the preliminary planning and scheduling that goes into [the] design. P/A editors feel that this completely rational space analysis is interesting, as one met[hod] worked out by one architectural organization; the student of this problem might want to comp[are] it with a technique described by Dr. Charles Bursch and Rouel J. Taylor in *College and Univer[]sity Business* for November, 1950.

The buildings presented here are also notable for their technical excellence. Again us[ing] Orange Coast as an example, an analysis of structure, acoustical control, lighting and the us[e of] color is offered, following the building presentations.

Pages 63-67refer to the buildings by architects Ginocchio & Cromwell at Little Rock Junior College in Little Rock, Arkansas. They have been excluded from this document.

The article resumes on the following page with material relevant to Orange Coast College.

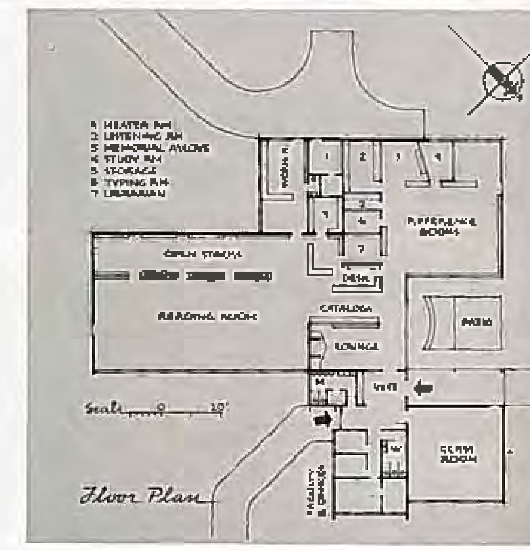
"College Buildings: A Space Analysis." *Progressive Architecture* v.33 (USA: February, 1952): page 62. Source: Helen Topping Architecture & Fine Arts Library, University of Southern California.



location	Costa Mesa, California
architect	Robert E. Alexander
associate architect	Richard H. Mager
civil engineers	Parker-Zehnder & Associates
landscape architects	Eckbo, Royston & Williams

Established in 1917, Orange Coast is a public junior college in the heart of a rich agricultural and oil-field district southeast of Los Angeles. Initial enrolment was 521; present construction is planned for an anticipated student body of 1500 in 1964.

The level, rectangular property, 243 acres in extent, was part of a former Army Air Base and included numerous typical Army buildings — barracks, classroom buildings, etc. To determine the physical needs, the architect undertook a most painstaking analysis of space requirements, the method for which is de... on pages 61-62. An equally detai... of existing structures to decid... could be economically salvaged o... cled was also part of the archi... liminary work. The campus pla... above is the end result, with the m... pus group occurring in the souther... rant. Traffic circulation is kept t... ter roads, parking areas, and ... service drives. Shown in the ... three of the new units — libra... feeding shed, and technology ...



library

Due to the fact that the drawings were issued for bids the day before the President made his announcement on Korea, resulting price increases made necessary a severe curtailment of the hoped-for program. A comparison of the rendering (top) and the finished building emphasizes this fact. However, by use of tilt-up concrete walls at the ends of wings (hence, readily movable), provision has been made for the eventual realization of the full program.

Among the facilities for which future expansion is planned are: the reading room for 100 (later to be enlarged to accommodate 200); stack space for 15,000 volumes (eventually 40,000); a reference room for 50 (expandable to 100), and the classrooms, to which two more will be added.

Located near the center of the group of classroom buildings, the library adjoins a large parking lot, the principal entrance for students. Throughout, the design wish was to provide an inviting, informal, and relaxing place, rather than a monument; it is not designed as a repository for books but as an educational tool for daily use by all departments.

Structurally, the building is similar to that of the classroom wing of the technology building (Pages 73-79), employing small structural steel columns that support steel beams 8 feet on center which, in turn, support a wood roof structure.

Collaborating in the design of the library were Sheldon W. Swickard, Electrical Engineer; Samuel L. Kaye, Mechanical Engineer, and Rex Brandt, Color Consultant.

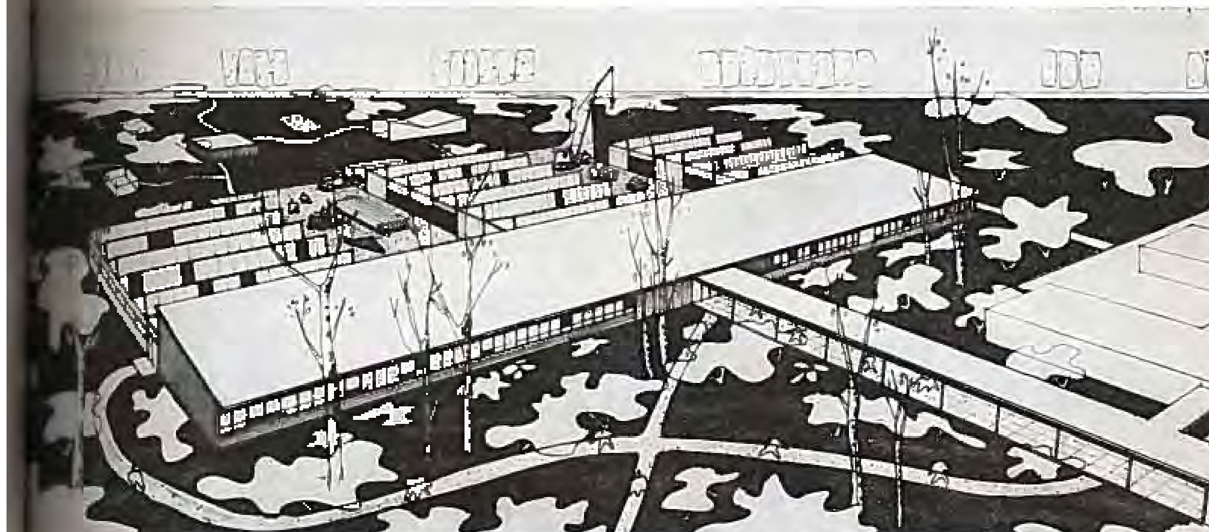
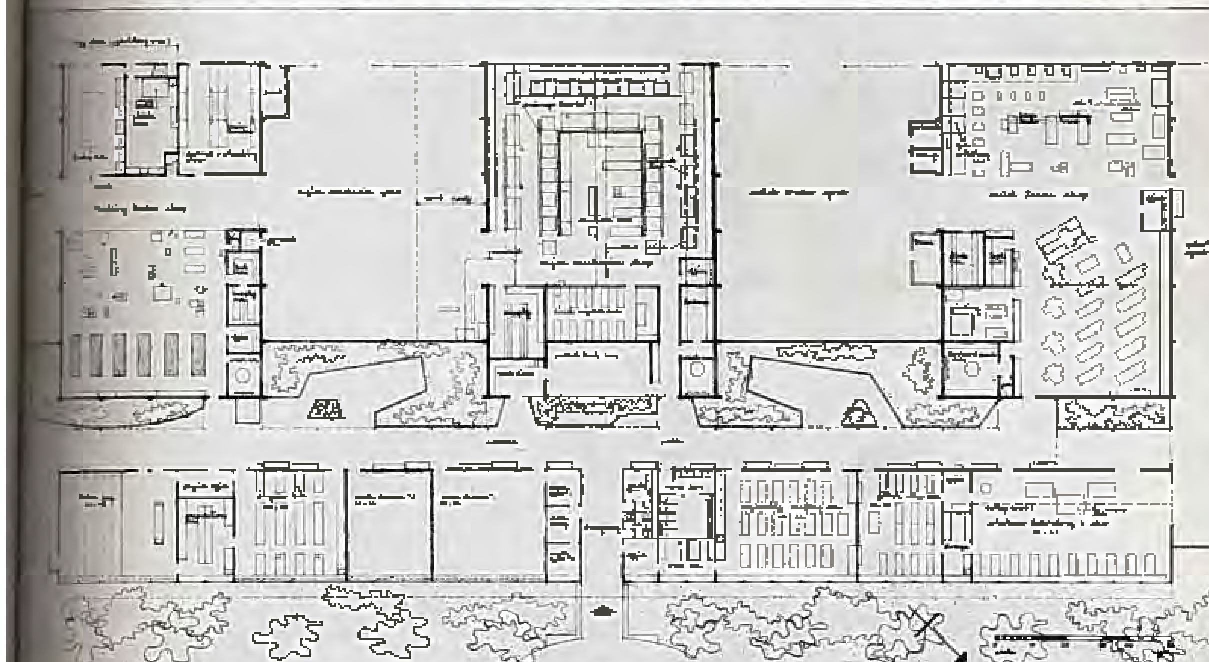
beef-feeding unit

On this page is shown the cattle-feeding shed, with a pair of corrals along each long side. This handsome structure is framed with structural steel columns 12 feet on center that support a timber-framed roof surfaced with corrugated aluminum. The shed recently won a Special Citation for design excellence—"simplicity and clean construction"—in the Southern California and Pasadena Chapter A.I.A. Honor Awards Competition. Corral and cattle-lane fencing is of redwood posts and for horizontal members. "Heating and air conditioning are natural," the architect points out, "and quite successful . . . Only sufficient artificial lighting was provided to prevent rustling." Associated in the design were Sheldon F. Swickard, Electrical Engineer; and Samuel L. Kaye, Mechanical Engineer.

orange coast college: technology building





...is remarkable structure, which won ...orable Mention in Architecture in the ...thern California and Pasadena A.I.A. ...or Awards Competition, is one of those ...buildings wherein plan, structure, and ...eans of control are so inseparably integrated that it is almost impossible to consider one aspect without reference to them all. To point up this notable correlation of elements, we present a special technical discussion of the design on Pages 76-79.

Basically, the plan consists of a long pavilion of northeast-facing classrooms and labs, with three specialized training shops (building trades, engine mechanics, and metal trades) in wings to the rear, separated (physically and acoustically) from one another by outside work yards.

"College Buildings: A Space Analysis." *Progressive Architecture* v.33 (USA: February, 1952): pages 72-73. Source: Helen Topping Architecture & Fine Arts Library, University of Southern California.

technology building

Behind the mass of the classroom wing (above) may be glimpsed the sawtooth monitors of the three shops.

The metal trades shop (right, above) looking toward the northeast end; (below), the courtyard adjoining this shop.

Over-all end view (acrosspage, top), with classroom wing at left. Door in end-wall leads out from the petroleum laboratory. A covered walk (bottom) connects all units, with open courtyards between.

Associated in the design of the tech building were Foster K. Sampson, Electrical Engineer; Samuel L. Kaye, Mechanical Engineer, and L. F. Sepmeyer, Acoustical Engineer.

Because of the noise factor (see pages 76-77), the tech building is located at the edge of the instruction center.

The building trades shop has a central project area with 14-foot doors at either end opening out to adjoining project yards. The engine mechanics shop is equipped for study of truck and marine engines as well as diesel and gasoline types. Typical of the care in detailing is a viewing partition that also controls sound —two different thicknesses of glass set in a frame in such a way that the intervening space varies from top to bottom.

The metal trades shop includes arc and gas welding, foundry, forge, sheet and art metal work, and a machine shop.

The building is heated from a central circulating hot-water system that supplies heat to suspended units in shops and, in the classroom wing, to fan coils and a continuous fan-coil loop that extends the length of the window-wall. Manual control dampers determine whether air is pulled across coils or introduced directly into rooms.

"College Buildings: A Space Analysis." *Progressive Architecture* v.33 (USA: February, 1952): pages 74-75. Source: Helen Topping Architecture & Fine Arts Library, University of Southern California.

Blower Off (quiet ambient condition)	40	24	40	less 24 db.
Blower On	44	28	50	36
Planer in Operation	—	31	—	31

The planer was just audible above the background noise.

technology building: structure-acoustics

One can hardly discuss the technology building's structure or acoustics individually; they are so interrelated that an analysis of one becomes a compendium of the other. The primary acoustical problem was to keep the noise originating in the shop areas from interfering with lectures in the classrooms. The noise sources to be isolated are of a severe nature, and further, the confinement of sound, caused by the side walls of the shop buildings and the covered walk between the classroom and shop buildings, decreases the amount of attenuation considerably below the inverse square law usually applied to sound in the open.

The main locations of noise entering a classroom are: (1) along the southwest wall from courtyard activities and transmission through the northeast shop walls; (2) through the roof from noise transmitted through shop roof windows and also the courtyard noise; (3) the northeast window-wall from noise diffracted around the roof and also from foot traffic and conversation noise on this side of the building. Owing to the character of the noise and the increasing transmission loss with frequency of the various structures, all of the sounds would result in predominantly low-frequency noise in the classrooms. Low-frequency noise has the highest masking or interference effect on speech; therefore, in order to keep the masking within acceptable limits, all noise components had to be reduced at least to the 40 db. free field loudness level contour of the ear.

A brief statement of the framing follows: Light steel trusses, 16' on center and spanning the 64' width of the shop areas, are supported by reinforced concrete columns (*top section acrosspage*). The southwest and end walls of the classroom wing are of tilt-up concrete construction; wide-flange roof sections are supported by structural steel columns along the northeast wall and by welded, back-to-back channels along the southwest—all 8' on center (*details acrosspage*). The entire classroom building is given transverse lateral support by struts 64' on center which connect the roof of the building with the long masonry walls of the shop. The resulting structural design permits a completely flexible interior for the classroom wing which has no permanent interior cross-bracing partitions.

That one wing contains a structural steel frame and the others a combination of reinforced concrete columns and structural steel trusses, is more readily understood as one considers the problems involved. In the shop areas, noise is minimized by the provision of as much sound absorption as possible. This was accomplished at very little expense by using wood fiber-cement board of high sound absorptivity for roof-deck insulation and by utilizing a porous lightweight-aggregate concrete block between columns. As high strength and high acoustic absorptivity are incompatible requirements for this type of concrete block, the reinforced concrete columns were a compromise necessary to meet the strength requirements for bearing. Sawtooth monitors greatly reduce the reverberation within these areas.

To obtain the needed acoustic integrity for the classroom building required the elimination of operable windows in the northeast wall, a roof structure better than otherwise might be used, and very good doors, tightly closed. Although the window wall does not have as high an absolute sound transmission loss as the southwest wall or roof, its remoteness and shielding from the high noise fields make it relatively equal to them. By providing the classroom roofs with an auxiliary ceiling and by adding lined ducts or baffles to all openings needed for ventilation, a structure having approximately uniform sound transmissivity was obtained (*details acrosspage*).

In order to achieve effective sound isolation, it was also necessary to place sound absorption inside the isolated room. This presents somewhat conflicting requirements; if the room is made too dead acoustically, an undue effort would be req on the part of the instructor in ma himself heard. However, the acoustic t ment which was installed was design supply as much sound absorption a sible at low frequencies. This was a plished by using large tile, with air behind, to get maximum benefit fro diaphragmatic action and improved tic impedance. The unperforated til vides low-frequency absorption w adding much in the speech range. S strip of acoustical board along the east side of the room would have ... with the introduction of daylight, the wall was tilted outward to reduce a cal flutter between parallel walls.

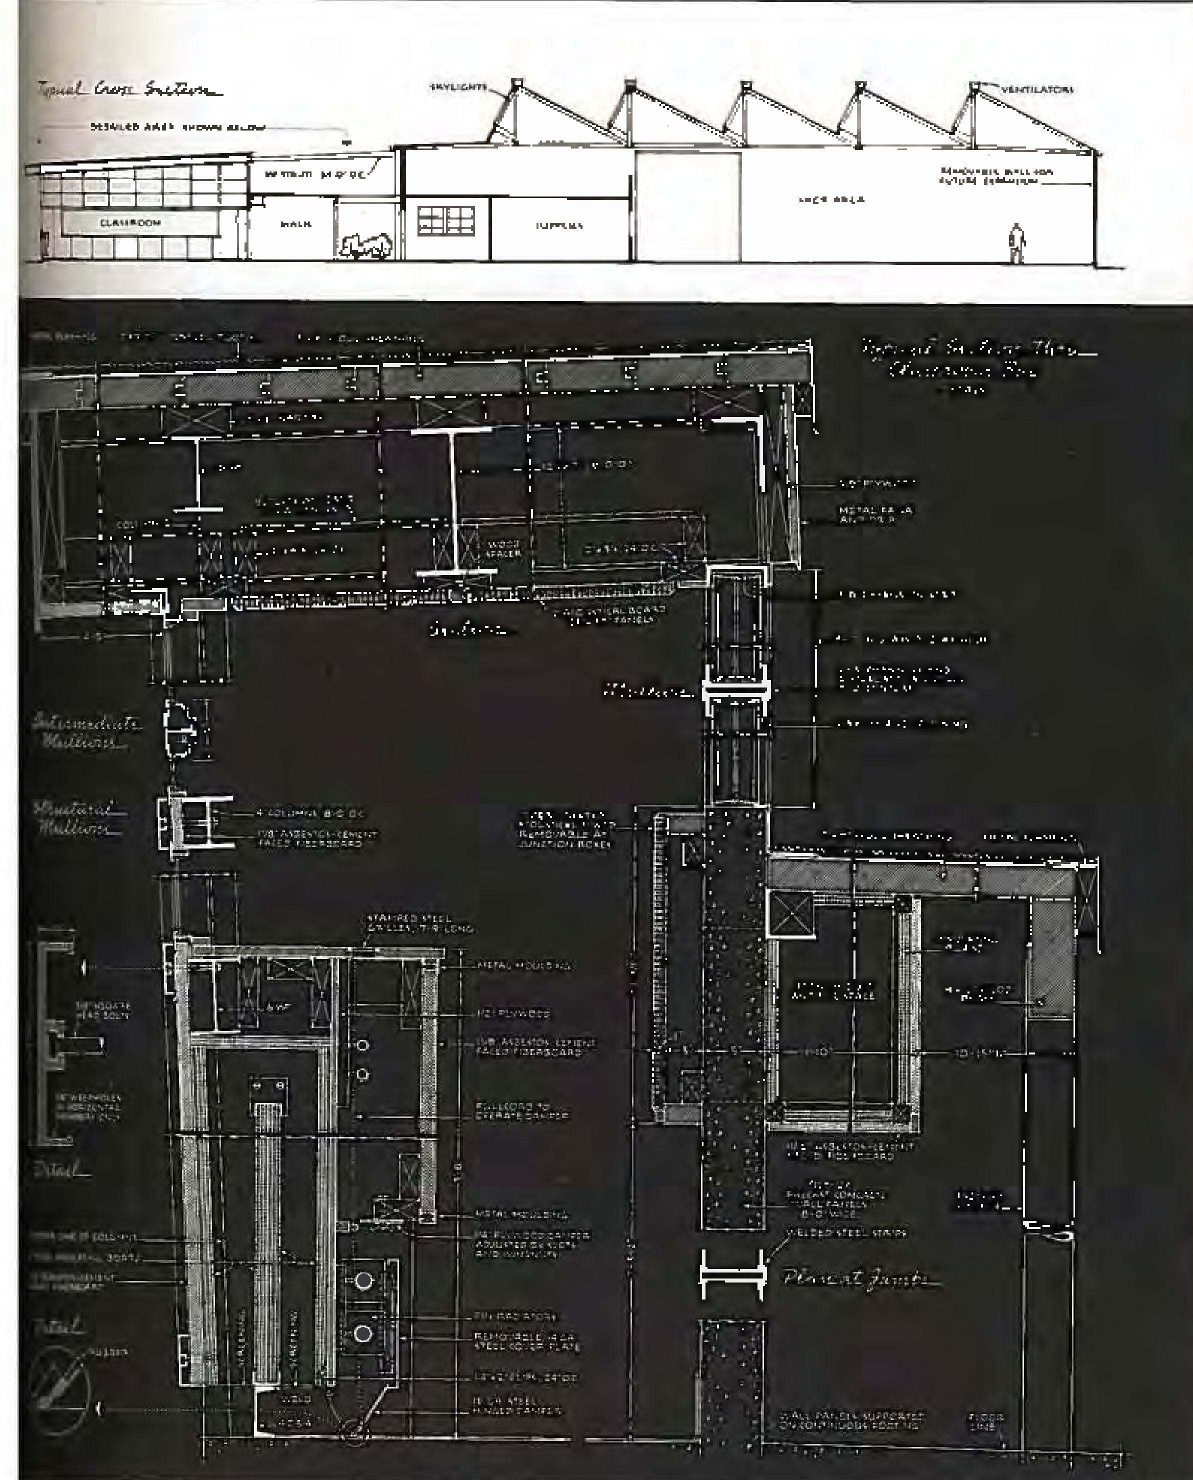
To check the performance of the a cal design, some sound level measure were made on a Saturday morning other campus activities were at a mi The sawdust and chip-collector b proved to be the most powerful lo quency noise source, producing a ma level of 90 db. in the wood shop. W planer was louder, it did not prod much low-frequency noise. (*Table I marizes the noise condition as meas the large lecture room and the clas adjoining it.*)

As a measure of the effectiveness northeast wall and ventilating ba motor scooter was run in a load con about 30 feet from the wall. The level outside, next to the wall, was on the flat position and 65 db. wit weighting. Inside the classroom, th level was 55 db. and 40 db., respecti

The effectiveness of isolation b classrooms was measured by havin one speak loudly, at 70 db. maximu level, while the sound intensity wa ured in an adjacent classroom. case the measured level was 30 d the speech was not measurable ab ambient noise, although it was a However, under actual conditions, th ence of an audience would red level in the source room and incre background noise in the receiving

---

This analysis was based primarily on a report prepared for P/A by Ludwig William Schnayrt, Consulting Engineer.



“College Buildings: A Space Analysis.” *Progressive Architecture* v.33 (USA: February, 1952): pages 76-77. Source: Helen Topping Architecture & Fine Arts Library, University of Southern California.

Walls: 50 percent, blue-green
Ceiling and above dado: 75 percent, acoustic tile

technology building: lighting-color

lighting

A bilateral fenestration scheme was designed for the classroom wing. The window-wall admits a northeastern light while the prismatic, glass-block panel atop the opposite wall faces southwest. (*The above diagram provides illumination data for the daylighting of a typical classroom at about noon on a clear day.*) Although the concentric-ring type of ceiling fixture provided excellent artificial lighting, the heat load automatically increased the problems of ventilation and temperature control. Vertical operating louvers were placed inside the windows in order to control daylight for the operation of visual aids (*opposite page*). This method was selected principally because of its ease of operation, low maintenance, and long life. Although this control is satisfactory for the use of visual aids, the architect points out that it is impractical to expect to obtain satisfactory darkness for optical experiments by any means other than a completely enclosed blackout room.

The sawtooth monitors contain five-foot deep, continuous skylights; as each spans the entire width of a shop building, an abundance of northeast natural light is available. Artificial lighting is supplied by an industrial-type fluorescent installation (porcelain enamel reflectors) mounted at a height of 16' (*photo page 74*). Both quantity and quality of lighting has been considered excellent for the tasks to be performed in these working areas.

color

As an olive-drab color saturated most of the existing campus buildings at the commencement of the new building program, it was at once desirable to select a fresh, basic wall color. Eucalyptus green (gray-blue green) was chosen because it effectively removed the "Army hangover" and also because it was capable of doing so in one coat; an off-white trim was preferred for its sparkle.

During a preliminary discussion between architect, color consultant, and school administrators, agreement was reached that it was neither necessary nor desirable to attempt to assimilate old buildings and new buildings colorwise. Subsequently, the color consultant conferred with most of the teaching personnel before submitting a tentative series of swatch-abstracts for approval. Among those associated with the technology building, there was some difference of opinion concerning the most desirable colors for this structure; in general, however, it was agreed that the functional justifications of color would be the first criteria of acceptance.

The extensive use of aluminum a[nd] natural finish of the blue-gray a[sbestos] cement board seemed to call for a color of minimum contrast to main[tain the] dignity and weight of the building. [...] college officials were pleased with the basic wall color, it was also selec[ted for] the technology building. At pres[ent ...] contrasted with the burnt sienna [...] the corrugated metal-asbestos ends [...] shop wings and for future building[s ...] contrast with brick or other pre[...] warm materials—or it may be desir[able to] add a warm paint color for acc[ent ...] contrast.

Walkways are now a warm color [...] aids in emphasizing the gener[al] quality of the wall. This color [...] not only considered practical but [...] helps to keep the planting and la[...] fresh appearing by complimentary [...]

To diffuse light and to give a[...] sense of reflectance and sunlight, [...] bangs, where painted, were made [...] light yellow.

An extensive use of varied mater[ials ...] prefinished surfaces precluded [...] volved paint scheme; contrast of [...] was used to give interest. Howe[ver, it] was realized that this same contr[...] it difficult to match color from wal[l ...] it was considered most desirable [...]

[...] a neutral trim color to weld these prefinished materials together. Recognizing the effect of the textural differences in wall colors, each condition was handled with subtly contrasting tones of the proper value for light reflectance and attention. For example, as prefinished concrete walls will not match the color of a painted-concrete-block wall on the exterior, the concrete was painted a deeper value of the same color.

Recommendations of the National Council on Schoolhouse Construction were heeded as far as possible; however, some special conditions, peculiar to this building, may have modified this consideration. Some of these were:

1. The skylights of the shops which gave direction to the northeast light, made it possible to use some darker walls.
2. A workshop could have somewhat darker walls for two reasons: (a) maintenance; (b) to reduce reflectance so that the maximum brightness could be on the work. (The rule of 2 to 1 was observed.)
3. The more than average quantity of classroom light required maximum light [...] is adjacent to the natural light sources to reduce contrast; by the same token it was possible to suggest a slightly darker attention wall.

[Th]is color discussion has been prepared from data [sub]mitted to P/A by Rex Brandt, Color Consultant.

Two views of physics laboratory (below). Room dimensions are 40' x 32'; ceiling heights are 13'-4" next to the glass-block panel and 11'-9" at the window wall. In addition to providing excellent daylight distribution and high daylight utilization factors, the glass block panel also acts as an efficient sound barrier.

color consultant	Rex Brandt

Fast emerging from a 243-acre section of a former Army Air Base is the striking new campus of Orange Coast College, a public junior college located in the busy agricultural and oil area southeast of Los Angeles. In February 1952 P/A, we presented the full campus plan and described three of the earliest completed structures—the Library, a cattle-feeding unit, and the Technology Building. Now, in this issue, we show three of the newer buildings—the Student Center, the Art Center, and the Business Education Building (first campus building completed since Richard J. Neutra formed a partnership with Alexander). Also, as a herald of good things to come, note the photograph (*across-page*) of the recently completed Speech Arts Building and Auditorium, which was designed by Neutra & Alexander, and will be presented in P/A later this year.

The curriculum of Orange Coast—which determined the required buildings—is based on impressively extensive surveys of the educational and occupational needs of the region. Essentially these are self-appraisals, since they were made by the College staff, including both trustees and administrative officers.

For development of the co-ordinated campus, Alexander gives very special credit to the Board of Trustees, all five of whom have served since inception of the project. These are: Louis Conrady, D. D. Lawhead, Harry R. LeBard, Walter M. Longmoor, and Horace Parker. The various administrative officers who have be[en] highly instrumental in seeing that [the] scheme has prospered include: Basil [H.] Peterson, Ph.D., President of Ora[nge] Coast and District Superintendent; Ja[mes] W. Thornton, Jr., Ph.D., Vice-Preside[nt]; William J. Priest, Ed.D., Assistant Sup[er]intendent in Charge of Vocational Ed[u]cation, Adult Education, and Sum[mer] Session; and William F. Kimes, M[.A.], Assistant Superintendent in Charge [of] Business. Members of the Neutra & Al[ex]ander staff who are accorded partic[ular] mention are: Dion Neutra, Robert Pi[...], Dike Nagano, Frank Kelly, Al Bo[...] and Andrew Balfour. Credit is also [ex]tended to the California State Divisi[on of] School Planning.

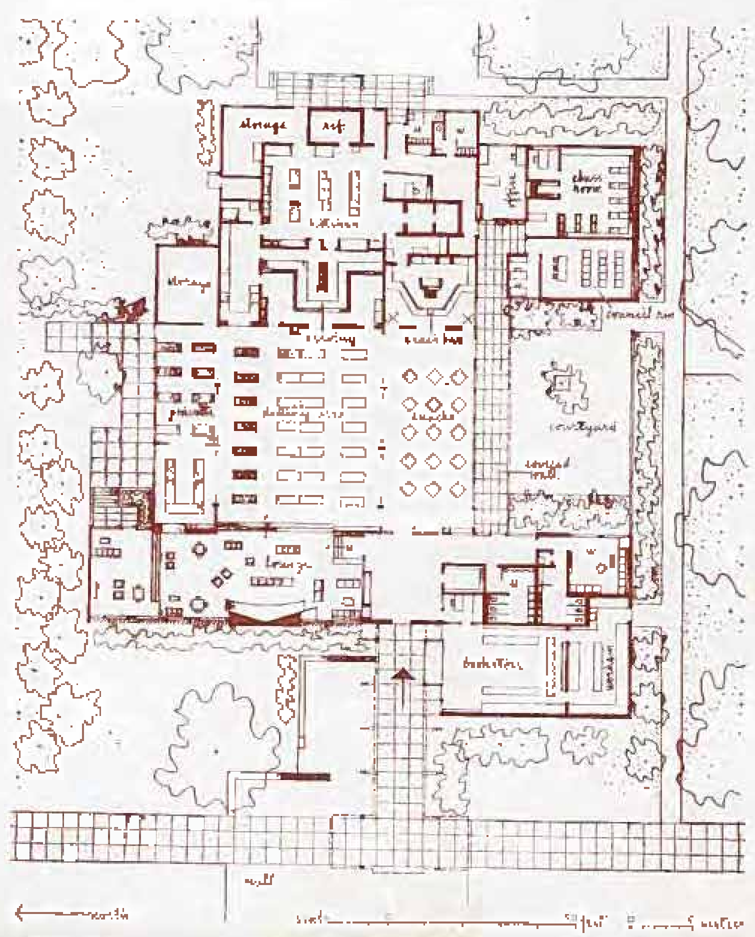
Orange Coast: Student Center



Eating, lounging, and recreational facilities are supplemented by student group offices, a journalism classroom, and a bookstore. The lounge (right) may be used as an informal auditorium and stage (raised area at rear). Sliding panels and accordion-fold doors offer great flexibility in use of dining spaces. A landscaped, south-facing court (below) provides a sunny outdoor lounge.

Opened sliding doors join lounge and main dining room (right). Structure is basically wood frame on concrete slab, grade beams, and caissons. Exterior materials include plaster, brick, and enameled-metal sunshades. Floorings are wood block or asphalt tile; acoustical tile is used on ceilings. Sash is aluminum-projected type. Parker, Zehnder & Associates, Structural Engineers; Bartlett & Besky, Mechanical Engineers; Sheldon W. Swickard, Electrical Engineer.

"Orange Coast College, Costa Mesa, California." *Progressive Architecture* v.36 (USA: July, 1955): pages 84-85. Helen Topping Architecture & Fine Arts Library, University of Southern California.

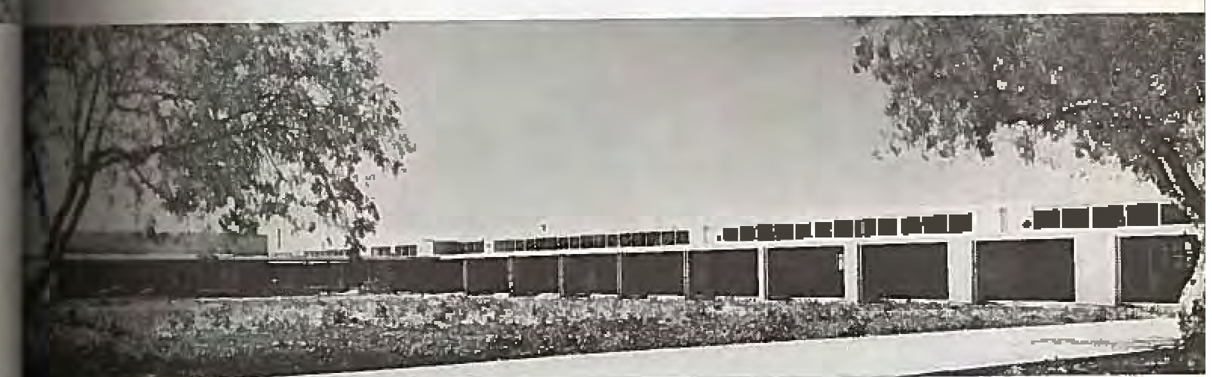
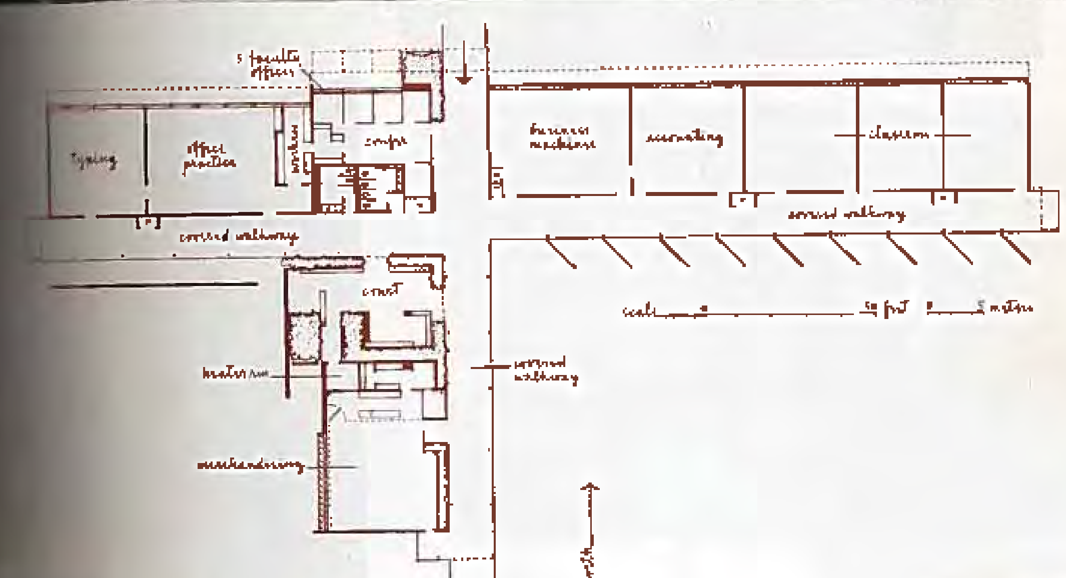
Orange Coast: Business Education Building

First of the campus buildings designed by the partnership of Richard J. Neutra & Robert E. Alexander, this T-shape structure houses a variety of facilities for instruction in business practices. The accounting lab serves also as a filing-systems teaching room. Most extraordinary unit is the merchandising lab, complete with its showcase and other elements to be found in a small store.

For details of louver at main entrance (top), see SELECTED DETAIL, *page 124.*

A landscaped court separates the merchandising lab unit from the main building (two photos acrosspage, bottom). Bordering the south-facing access corridor of the classroom wing (below) are bold masonry wing walls, set at an angle (right), that protect the passage from prevailing winds and rains, as well as sun. Basic structural scheme is of reinforced brick, the transverse walls supporting a continuous steel beam left exposed on the interior. Other portions utilize wood frame and brick veneer. Rooms are heated by individual gas-fired warm air furnaces, individually controlled thermostatically.





"Orange Coast College, Costa Mesa, California." *Progressive Architecture* v.36 (USA: July, 1955): pages 88-89. Source: Helen Topping Architecture & Fine Arts Library, University of Southern California.

Orange Coast: Business Education Building

The merchandising lab is set off from the main unit in a separate little building (top), whose west-facing windows are screened by corrugated aluminum louvers. The large space within (above) offers complete flexibility for instruction in the many phases of merchandising. At the far end of the room, a display corner with three-way mirror and store-lighting fixtures (right) allows practice in display methods. This whole work end of the room may be divided from the main space by accordion-fold partitioning.

speech arts building

location	Costa Mesa, California
architects	Richard J. Neutra & Robert E. Alexander
associate architect	Richard H. Pleger
landscape architects	Eckbo, Royston & Williams

Latest of the campus buildings to be completed at Orange Coast College is the Speech Arts Unit, heralded in July 1955 P/A, which featured campus structures completed up to that time. The Speech Arts Center is composed of a large auditorium with multipurpose stage, amphitheater, and a music building containing choral, band, and practice rooms. It is a remarkably versatile group of buildings, which not only serves the college in many different capacities, but also the community as a whole. As Richard J. Neutra pointed out in his recent book, *Survival Through Design*, "The all-purpose character of such a space which is to serve and activate a community is markedly different from that of the more specialized theater as it developed especially since the Renaissance into a place where [illegible] tors forming one world peep [illegible] proscenium arch into another [illegible] hearsed and staged world [illegible] barrier of footlights. . . . Behind [illegible] dent body of a college, for [illegible] stands a wider and elastic [illegible] which may and should on [illegible] verge on the campus." One [illegible] change contributing to the [illegible]

[illegible]oday's campus theaters is the audience [illegible]self, which is now very often a par[illegible]ticipant rather than a group of mere spectators. "Participation," continues Neutra, "means being taken in, as much as feasible, making performance total, instead of 'half and half.' The stage extending around the 'audience,' or the audience surrounding the stage and players are two approaches to this totality, and at the same time, toward the desired intimacy between the two halves." To a degree this intimacy was achieved by the Elizabethan stage—the little theater-in-the-round—which has recently found favor again. On the other hand, suggests Neutra, there is a definite need on occasions for the opposite approach. "It is the one of surrounding the audience by action; simultaneous activity or action in sequence." This may be achieved by a widening and deepening of the stage, by special side stages, appropriate illumination, or an opening onto an outdoor terrace beyond the stage.

It would be difficult to find a more specific application or illustration of these theories than the recently completed Speech Arts Center, shown on these pages, and designed by Neutra and Robert E. Alexander. Among others who contributed to the success of these buildings were: Structural Engineers Parker, Zehnder & Associates; Mechanical Engineer Chester Walz; Electrical Engineer Earl Holmberg; J. C. Boespflug Construction Co., General Contractor; Rex Brandt, Color Consultant; Dr. Vern O. Knudsen, Acoustical Consultant.

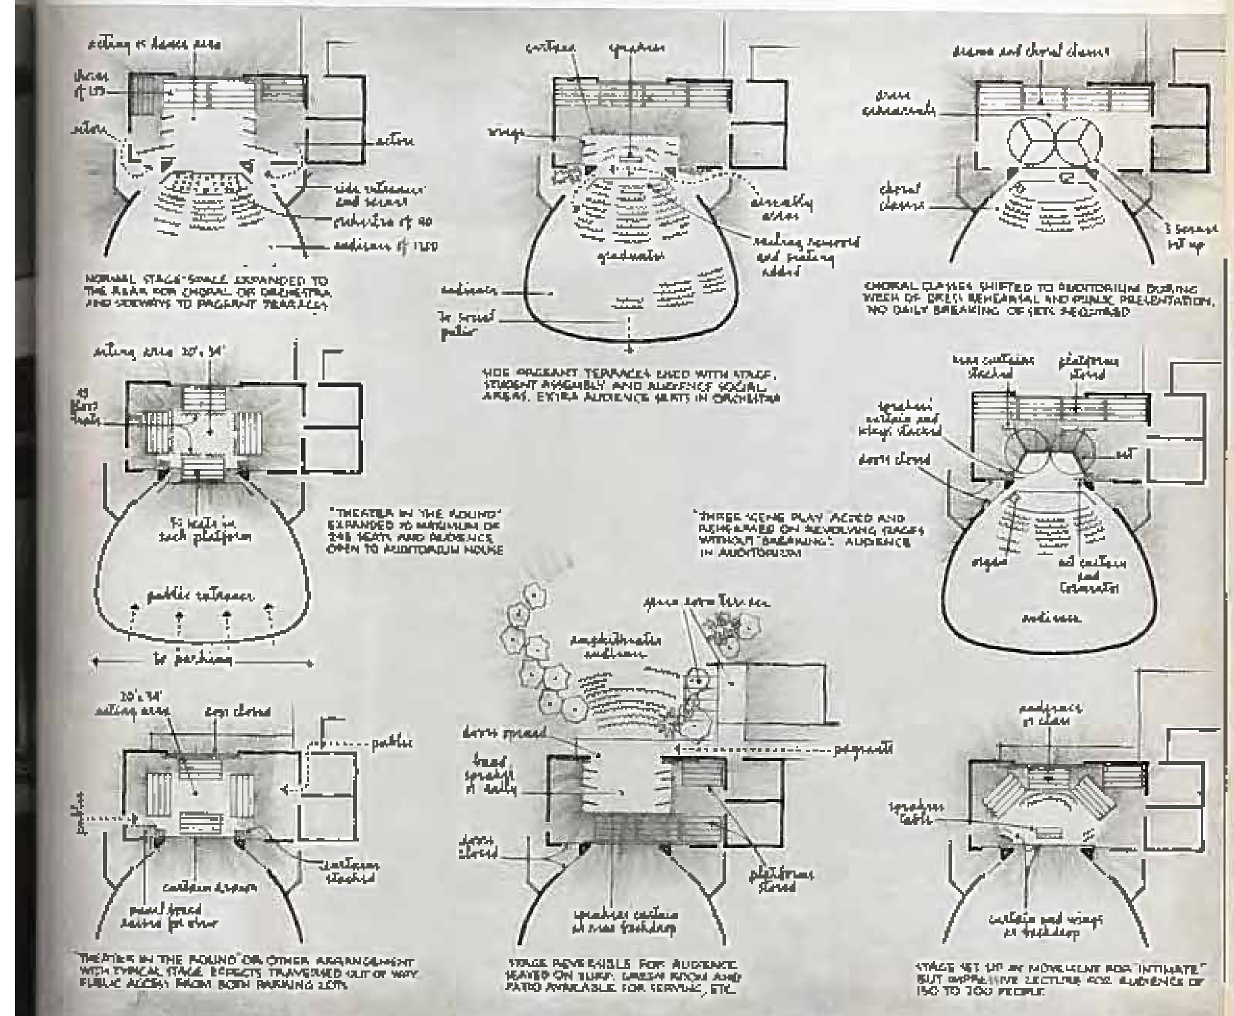
speech arts building

The auditorium, together with stage and stage-craft facilities (*above*), covers an area of 24,492 sq ft and seats 1200 persons. Adjunct services include a projection booth, orchestra pit, organ loft, public-address system, storage space, and dressing rooms. The auditorium, of roughly egg-shaped plan, has reinforced-concrete floors and walls, steel roof trusses, and wood roof construction. Inside, the auditorium has screen walls of plaster or perforated hardboard, and ceiling baffles of plaster. A separate gas-fired air heating and ventilating system provides for audience comfort. Stage and auditorium lighting-control panels, including preset boards, are placed on a platform above the sliding doors of the side stages.

The stage, an area 45 ft deep and 104 ft wide, is perhaps the most versatile and ingenious part of the Speech Arts Center. Numerous arrangements (*illustrated acrosspage*) are made feasible by movable doors, curtains, stage platforms, side stages, and revolving scenery platforms. Thus, use of the stage may range from a most intimate theater-in-the-round, seating up to 250 persons, to a focal center linking the indoor auditorium with the outdoor amphitheater, the whole seating a total of 3600 persons.

Preliminary "flexibility diagrams" (below) served as guides throughout the entire planning stages of the Speech Arts Center. From these, the manifold operations of the building are clearly apparent.



View of stage (left) from auditorium shows outdoor amphitheater in background. Automatically operated doors permit use of stage with either auditorium or outdoor amphitheater. Two revolving stage platforms allow for presetting of three or four scenes for quick changes. Tracks at ceiling carry teasers, wing drapes, and border lights. Rear main drape may also be used as front drop for amphitheater.

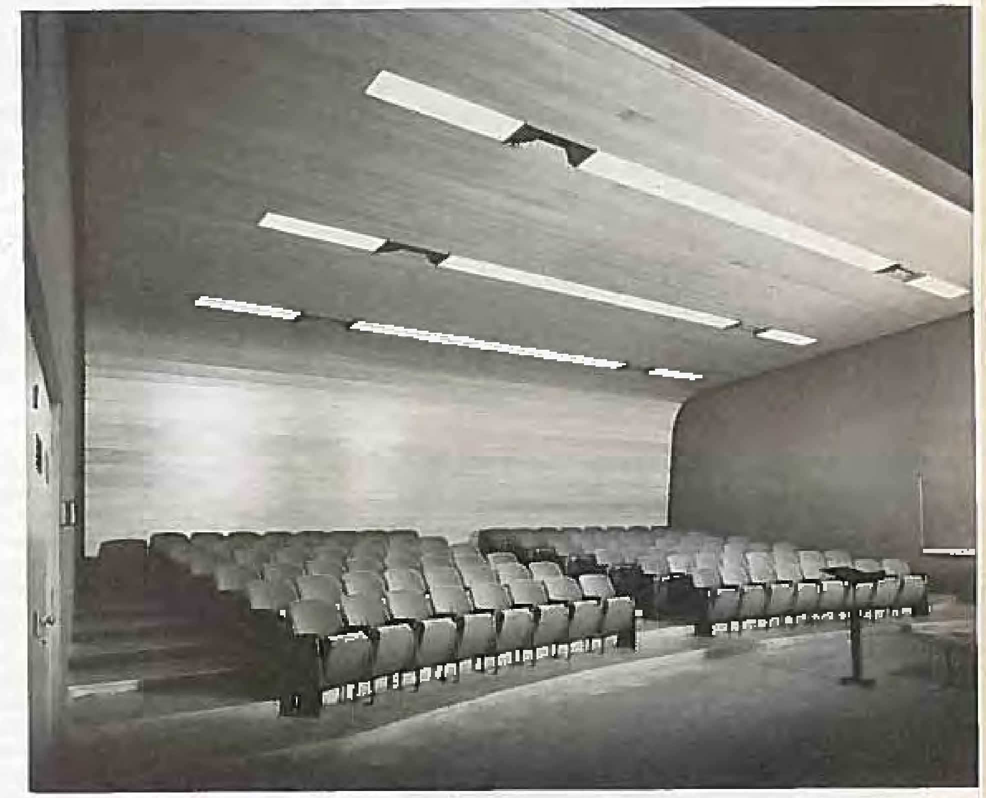
speech arts building

For economic reasons, the lobby was con[illegible] shelter without walls but shielded from [illegible] west wind by a glass screen (below). E[illegible] this lobby is from three directions—ma[illegible] approach from the east (above), pedes[illegible] from the north (left), and covered walk [illegible] (bottom). Approach from the west [illegible] shelter to music building.

Vertical marks on concrete walls of auditorium (left) are the results of slip-forms moved upward during construction. Rectangular structure in background encloses stage house, stage-crafts facilities, heater and boiler rooms. Covered walk in foreground leads to music building.



Music building houses choral, band, and practice rooms, facilities for instrument repair, and uniform storage. Choral room (above) employs sound-absorbing blankets behind perforated-hardboard end walls. End walls, part of ceiling and wall above chalkboard in band room (left) are also acoustically absorbent. Instrument storage is at rear of room.

Es handelt sich bei dem publizierten Bau um ein Institut zur Pflege der englischen Sprache mit angeschlossenem Theater- und Konzertsaal. Das Institut ist ein Teil eines großen Collegekomplexes, der sich in Costa Mesa seit vielen Jahren langsam entwickelt hat. Nicht nur in den USA, sondern auch in anderen Ländern englischer Sprache, z. B. in Südafrika, existieren solche Institute zur Pflege der englischen Sprache und Musik. Sie sind neben diesem Hauptzweck gleichzeitig Bindeglieder zwischen Schule und Außenwelt; es trifft sich in ihnen das allgemeine Publikum, dann aber vor allem die Gönner des Institutes und die Schüler. Als Schenkungsobjekt von reich gewordenen Privatleuten lösen diese Institute, die immer mit einem Theater verbunden sind, die Bibliotheken ab, die in Amerika in jedem noch so kleinen Städtchen zu finden sind. Neben der Pflege der Sprache wird auch Gesang und Instrumentalmusik betrieben, und für bestimmte Anlässe kulminiert diese Tätigkeit in Theatervorstellungen und Konzerten.

Auf der Bühne des Auditoriums kann ein Rundtheater aufgebaut werden. Die amerikanischen Institutionen solcher Art sind Träger des experimentellen Theaters, deshalb auch die Möglichkeit, neben Aufführungen mit traditionellen Bühneneinrichtungen Arenatheater zu spielen oder z. B. bei Tanzaufführungen das Publikum auf einer Fläche in der Mitte des Theaters sitzen zu lassen und die Bühne rings um die Zuschauer zu bespielen. Von solchen experimentellen Theatern geht in Amerika die ganze Theaterentwicklung aus. Hier werden moderne Schauspieler, Regisseure und Intendanten ausgebildet, die dann mit ihrem Wissen und ihren speziellen Interessen das kommerzielle Theater der großen Städte befruchten. Es entstehen in diesen Instituten oft auch ganz moderne Stücke mit neuer Darstellungstechnik und neuen Beziehungen zwischen Zuschauerraum und Bühne, die meist darauf hinauslaufen, den direkten Kontakt zwischen dem gespielten Drama und dem Zuhörer zu vermitteln.

Angeschlossen an den Theatersaal besteht ein Freilichttheater, wo die diesem Theatertyp eigenen Probleme gestaltet und ausprobiert werden. Es bestehen klare räumliche Beziehungen zwischen dem Publikumsteil, als Wandelhalle mit Kasse und WC-Anlage vor den Saalbau gelegt, und dem Saalbau selbst. Dieser hebt sich auch kubisch sauber ab von den niedrigen Bauteilen für Publikum und Collegebetrieb. Der Bühne mit ihren Variationsmöglichkeiten ist ein großer Raum zugewiesen. In einem eigenen Bauteil liegen die beiden Übungssäle für Chor- und Orchesterarbeit zusammen mit einer Raumgruppe für Einzelunterricht und Proberäumen.

Die Architektur ist unverwechselbar von Neutra, dem großen Zauberer unter den amerikanischen Architekten. Seine Mittel versagen nie.
Zm.

"AUDITORIUM"

Note: Ideas for a creative approach to design from "Survival Through Design", Oxford University Press, New York London, 1954

Auditorium is a facility for hearing, sitting—in fact, a man made space for an acoustical offering. Also, a title of a Building group such as *Speech Arts Center* seems to emphasize that speaking, and of course, listening is the primary purpose of the assembly hall. But no specific sensory appeal is hardly ever fully isolated and all senses collaborate heterogeneously to convey to us the raw material for forming, in the "central area" of our nervous system, a picture, an impression of the surrounding outer world, our position within it, and our relationship to external happenings.

This sensed relationship includes a good deal of emotional admixtures, more or less subconscious feelings of comfort or uneasiness, as the case may be. It includes, for example, a dim but effective consciousness whether, after a while, we get sufficient oxygen into our lungs to revive us; whether there is an air inflow with marked draft phenomena over our skin with too fast a cooling by evaporation of those million tiny sweat droplets, continuously secreted through each pore and lodged there.

While we seem to follow a choral performance in the Auditorium we can become faintly, and finally quite distinctly, aware that the humidity content of the air cushion around us is too high or in another section of our sensation, that the cushioning of our seat is too low or too stiff. Our posture, while we crane our necks to see between two persons in front of us, or over their heads, what is going on in the facial expression of the singers—is recorded to us by a multitude of muscle senses. We might get even weak visceral responses of not feeling well, getting seasick, dizzy.

The volatile smells which emanate from all the organic life around us may and should never, in an auditorium, reach the level of a zoological garden, nor should we be affectionately distracted by identifying the cleaning fluids and floor polish which had been used to shine up the place before we entered it.

But above all, there is no doubt that an auditorium, unless it is in a school for the blind, is not devoid of wealth of visual images, which should be made thoroughly meaningful by the designer. The space which we humans actually live in and, as architects, create, is not a mathematical or geometrical abstraction, but a multi-sensory and an organically fused unified experience. An auditorium where we are to share the intuitive and intellectual offering of a performance, be it that of a speaker, a chamber music group, a play done by professional actors or by beginners, or some pageantry of a commencement service,—an auditorium is actually in all of these cases a classic example of humanly created and enjoyed space.

The all-purpose character of such a space which is to serve and activate a community is markedly different from that of the more specialized Theatre as it developed especially since the Renaissance into a place where spectators forming one world peep through a proscenium arch into another well rehearsed and staged world behind the barrier of footlights.

Even quantitatively speaking, the audience formed by Court society—say, in Verona or Parma, or Mannheim, was a given immutable entity—so and so many boxes would take care of all the noble families which the kingdom and its subjects could support.

Behind the student body of a college, for example, stands a wider and elastic community which may and should on occasion, converge on the campus. A neighborhood recreation center may on special and festive occasions, draw crowds from way beyond the immediate neighborhood. Static classical proportions and set constrictive limitations of performance, [illegible] during its amortization period, produce [illegible]

Returning now from such sociological trains of thought to the [illegible] base of all that is human and concerns the individual and the [illegible] which is is geared in all stages of life, we have to recognize an [illegible] fact. Rather than spectatorship that views through a Louis XV [illegible] an actors', and singers' troupe on the Prince's retinue, performing [illegible] "Opera Seria", or a kept ballet corps going through the paces [illegible] playing most traditionalized set technique, we have today in mind [illegible] *participation*, change and experiment.

Participation means being taken in, as much as feasible, making [illegible] formative mind, instead of "hail and hell". The stage extending [illegible] the "Audience", or the audience surrounding the stage and [illegible] two approaches to this totality, and at the same time, toward the [illegible] intimacy between the two halves. The Greek amphitheatre was [illegible] the "Theatre-in-the-Round". But daylight makes always [illegible] hers see each other and the chorus and actors simultaneously. [illegible] emotion was transmitted in this extended face-to-face group. [illegible] "Penthouse Players" of Seattle and the other Little Theatres [illegible] of today, turn off the electric lights except those on the [illegible] as the activity starts.

We should have this treatment on occasion, in a "Little Theatre" [illegible] then, there is also the opposite approach: it is the one of [illegible] audience by action: simultaneous activity or action in sequence. [illegible] Watching can also be enriched by illumination reaching [illegible] beyond "frontal" into peripheral vision, with stimuli to the right [illegible] eliciting drastic eye and head movements of the entire audience [illegible] binocular field may perceptibly and impressively be deepened [illegible] the rear stage wall into a relaxing distance, a backdrop of [illegible] nature which even the grand Vienna Opera, with a stagehouse [illegible] a city block, could not offer, when the ghost ship of the Flying [illegible] became visible in the gruesome thunderclouds of a far away [illegible] The broad opening of the rear stagehouse into an outdoor backdrop [illegible] permits, on special occasions to have an indoor audience [illegible] audience and thus sandwich the performance between the two. [illegible] the mentioned potential cases staging, illumination, and the [illegible] watching meaningful movement will have to be varied, the [illegible] director and artists, the grouping of musicians, the arrangement [illegible] and instruments.

Sidestages, broadening the main stage may sometimes be [illegible] They too, can open and deepen into outer yards, kept as dark [illegible] space at night performances, while a few props, a plant [illegible] black tree trunk may suggest the private garden of Don [illegible] fateful battlefield of Philippi.

Auditorium-and assembly hall with appendages of "[illegible] vistas from the "Camino Real" over the sacred plains, [illegible] timeless precipices that make up a more-than-physical universe [illegible] thinking and creation—all this is indeed a wonderful [illegible] and artist of space.

BUSINESS EDUCATION BUILDING

The Business Education building, with its interesting [illegible] tory for the most practical and realistic instruction, [illegible] Speech Art Center with the grand "aula" or auditorium [illegible] of the campus are perhaps the most original additions [illegible] development of an institution of learning. Science, sport [illegible] stadium, swimming pools have been gradually developed [illegible] ing conditions of the building market, by faithful budgetary [illegible] well as devotion to the educational program of the college. [illegible]

ER DES ORANGE COAST COLLEGE IN ORANGE COAST, USA

ARCHITEKTEN: RICHARD NEUTRA UND ROBERT ALEXANDER, LOS ANGELES

Dieses Theater bildet einen Teil einer Hochschulanlage, welche etappenweise vollendet werden soll. Es stellt eine Verbindung eines Instituts zur Pflege der englischen Sprache, der Dramatik sowie der Vokal- und Instrumentalmusik mit einem Theater- und Konzertsaal dar. Es handelt sich um eine Stiftung, und das Theater soll nicht nur Lehrzwecken dienen, sondern auch zu einem Bindeglied mit der außerhalb des Campus wohnenden Gemeinde werden. Um die überragende Rolle, die es im Hochschulkomplex spielt, zum Ausdruck zu bringen, erhielt es einen zentralen Platz.
Das Auditorium, ein Vielzweckbau, soll bühnenmäßige Experimente ermöglichen. Die Technik des Rundtheaters wie auch die der dramatischen Szene, welche die Zuschauerschaft so weit wie möglich umgibt, soll während der nächsten Jahrzehnte Gegenstand von Untersuchungen werden. Vorkehrungen für diese beiden Möglichkeiten wurden getroffen, um die emotionale Teilnahme der Zuhörer zu wecken, und die Erfordernisse für die Darbietung von Sinfonien und Chorälen wurden sorgfältig geprüft.

PLANNING ARTICLES

THIS PAGE WAS LEFT INTENTIONALLY BLANK

Memo to: RICHARD J. NEUTRA
From: ROBERT E. ALEXANDER

Re: PLANNING A CAMPUS

Here we may look over the shoulder of a well known architect and planning consultant as he reads a report of a study of campus planning prepared by his partner

AS WE have found time after time, no two campus planning problems are the same.

At Orange Coast College we found a new institution starting in many ways from scratch, yet it was completely housed in temporary army buildings which had been condemned. An entirely new program was being developed from a survey of the community's indigenous needs and aspirations.

At St. John's we found a campus almost 300 years old, on which many of the physical determinants were already played out. Its unique curriculum and position as a pilot college in liberal arts education provided the background for a fascinating study.

Midway between these examples, at Adelphi College, we found a few permanent old buildings and an intriguing new concept for the development of a center of communicating and performing arts.

In every case, however, there is a common denominator in a method of approach and study, which we have brought to paper only as it is reflected in the end result. These methods are similar to those we have developed for the study of entire communities, and many elements of similarity, of course, can be found to any thorough architectural study. In every case, whether a new college is to be founded on a virgin site still undetermined or on the campus of the oldest university in the land, an outline of methods and approach would be helpful.

Even here, of course, a variety of approaches may be contemplated, and many steps might be eliminated or treated lightly. Naturally some factors are much more important in some cases than in others. It is also true that many boards cannot see their way clear to appropriate the funds necessary for a comprehensive study. Sometimes it is only after several years of development that it becomes painfully clear that hundreds of thousands of dollars would have been saved, if a few thousand dollars had been spent on development planning prior to the commitment of several million dollars in buildings which will serve the public for a hundred years or more.

An orderly summary of the considerations that should be taken into account in preparing a development plan should be helpful to any institution contemplating a long-range construction program.

Educational Planning

Purposes: A clear statement of the aims and purposes of an institution is essential as a guide not only to the faculty and student but to the architect as well. Here we should find the essential distinguishing characteristics which should be reflected throughout the entire planning process.

Organization: A description and even a reexamination of the organization of the institution may have a profound effect on planning. The philosophy of the institution may indicate the desirability of eliminating departmental or subject lines wherever possible, or the functional organization may be enhanced by a planning solution.

In one case that comes to mind, traditional departmental walls were consciously demolished or reduced in effect by the planning concept. In another case public attention and support were enhanced by distinguishing the unique characteristics of certain elements of the organization.

Educational program: The program developed to carry out the aims of the institution through its organization should be stated clearly. Elements of the program not yet installed, but contemplated, will affect a long-range plan. Here again it is the unusual or different educational offering which holds the greatest interest for the planner. An insight into the reasons for certain elements of the program will help in relating the design to the community, and in the development of interrelationships on the campus itself. Teaching methods should be analyzed, observed and described. These will vary from one institution to another and from course to course within the same institution.

Forecast of enrollment: A quantitative analysis of the probable growth of an institution should be made to cover the next 10 or 15 years. The technic must vary according to the circumstances. In any event it is essential that the governing board establish the ultimate enrollment for which the plan is to be made. This may involve not only the probable growth of the community and a study of age groups, but policy determinations governing admission policies as well.

Distribution of students: Quantitative assumptions must be made on the probable distribution of students among courses of study. These may be based on the past history of the institution or on a study of employment opportunities in the community.

Space Planning

Space requirements: Standards of space requirements per student for various activities should be established. Faculty members should be encour-

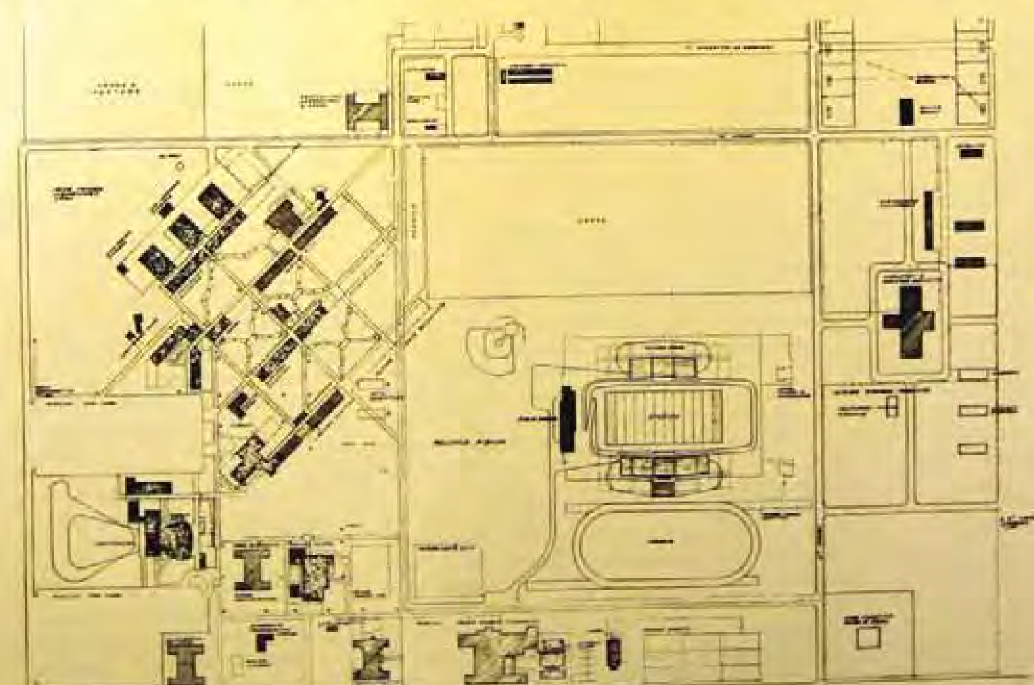
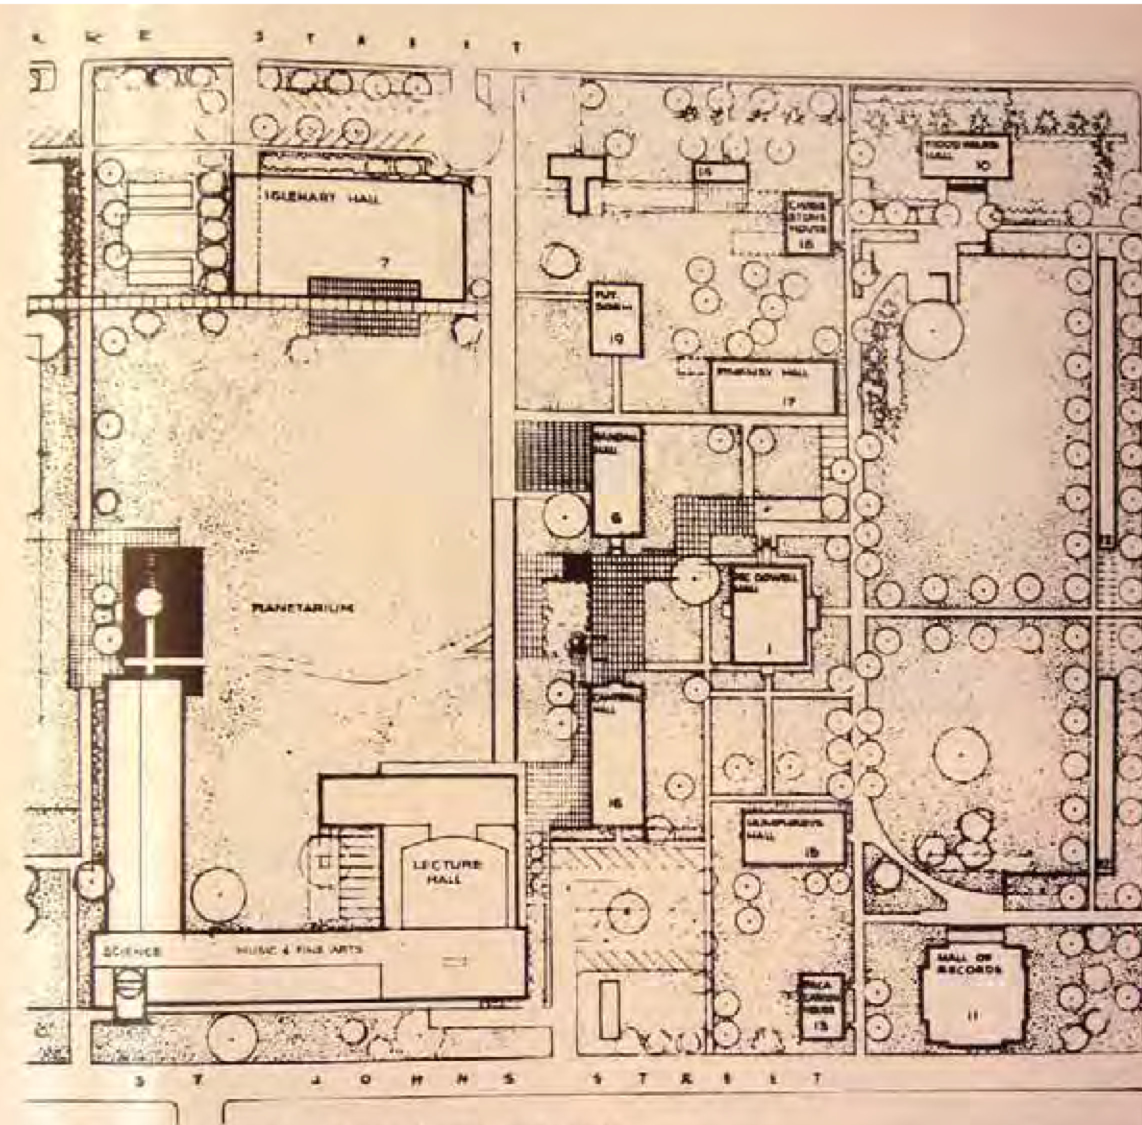
Above: Master plan approved by the board of Orange Coast College in March 1949. Below: Master plan modified over a period of eight years. The major modifications consisted of moving the stadium with its field house closer to the center of the campus and integrating the track with it. This permitted the field house to be used in conjunction with track and baseball as well as football, and to become a regular classroom building. The pools were moved from the center of the campus, where they had been located close to the Student Center, to a location adjacent to the old gymnasium so that showers and gymnasium facilities could be used without duplication.





Master plan for St. John's College, Annapolis, Md., which in contrast to Orange Coast College, where the architects virtually started from scratch, contained buildings dating back to colonial times. The portion of the campus toward College Avenue contains 11 historic buildings on a sort of acropolis. The steam plant had been built in recent years, but otherwise the lower part of the campus contained open space on which a composite building (with auditorium, science laboratory, and music lecture hall) has recently been constructed. It is known as the Francis Scott Key Memorial and Science Laboratory.

ARCHITECTS MAY 1956

Building policies: Certain fundamental decisions regarding building design may be made as a matter of policy at the start. The relationship of the program to the amount of land available may determine a building height policy. Decisions on space standards and typical dimensions may determine a modular unit which will carry through the entire campus. Daylighting policy should be established.

The objectives of the institution may be enhanced by a close-knit, unified court scheme or by a spreadout, spacious pattern of buildings grouped around a grand mall. A minimum budget related to the scope of the problem may call for individual buildings limited in scope and separated for fire protection. A more liberal budget or policies of permanence may permit multistory, connected structures.

Interrelationships: Certain functions or buildings may be grouped in categories according to their use by the students or by the community. For instance, certain functions such as the cafeteria, gymnasium or library are

Alexander, Robert E. “Memo Re: Planning a Campus.” Reprinted from *College & University Business* (January, 1959). Source: Robert E. Alexander Collection, Division of Rare and Manuscript Collections, Cornell University Library.

Francis Scott Key Memorial and Science Laboratory, St. John's College.

used by all students frequently. Others, such as an auditorium or chapel, may be used by all occasionally. Others, such as science laboratories and other specialized spaces, are used by special groups, some of which are related to others. Certain functions, such as the administration building and the auditorium, are used frequently by the public. The fact that every student of nursing spends a great deal of time in biology or that science students take a great deal of mathematics helps determine the interrelationship and location of certain functions.

As a policy of the institution, it may be decided to promote the use or awareness of certain functions of the institution by placing the library, for instance, in such position that everyone must pass it on his way to the student union. There should be conscious reason for the placement of functions in relationship to one another.

Construction Program

Grounds improvement: When a master development plan has been prepared to accomplish a certain program, the general assessment of construction cost requirements and ways and means must be developed. In the shuffle of estimating square foot areas and building costs, adequate attention is seldom given to grounds improvement. Adequate allowance should be made for the development of utilities, especially underground electric lines and drainage. Curbs, gutters, walks, outside terraces, reflecting pools, and landscaping should be calculated. A specific schedule should be made for an incremental program to proceed with the construction of buildings.

Building construction: In developing a comprehensive program at this formative stage, a contingency of at least 10 per cent should be added to all estimates of construction costs. In addition to this, allowance should be made for site and foundation surveys, advertising and prints, inspection and laboratory tests during construction, technical services, and furnishings. It is sometimes overlooked by governing boards that these items may easily add 25 per cent to the actual construction contracts. If a fund raising campaign is required, its cost must also be taken into account.

A clear understanding of what is to be included in buildings by way of equipment and furnishings, as contrasted to those things to be purchased as movable equipment and furniture, should also be made.

Priorities: When the entire construction cost program is outlined, it may be necessary to establish an incremental program. This may become a complicated game of chess when old buildings to be removed are involved in the scheme. It may prove most economical to build an entire structure in the ultimate program which will accommodate several functions temporarily until specific buildings are constructed to house them. Construction of scattered fragments may prove more costly and unmanageable than periodic remodeling to suit a changed use.

Fiscal program: Studies of alternative plans of financing must be made. For public institutions, a tax rate increase may be feasible politically and prove adequate to meet the growing need through a pay-as-you-go financing plan. An older public institution needing a new campus may have to resort to a bond issue. The resources of a private institution must be analyzed and related to the development program. The potential resources may even influence the concept of the plan itself, as we have seen.

In any event the careful preparation of the plan of development, properly presented to the citizens or potential donors, will play a major role in the financing of the project.

Schedule: A precise schedule of critical dates in the development program should be established and maintained.

Continued Planning

Building plans: Ideally, the advisers who have prepared the development plan should carry through the design of specific buildings. When this is impractical for any reason, they should at least be retained to advise on the design of specific buildings. As careful as they have been to bring as much as possible to paper during the preparation of a development plan, the end result will still depend on the specific execution of the designs.

Development plan review: The development plan itself is intended to be a guide. Over the period of development, especially in the case of a long-range incremental plan, logical changes are usually necessary, regardless of the time and thought devoted to the plan in the first instance. Experience in the growth and development of the institution, not to mention changes in contemporary life as reflected in educational needs, will demand certain adjustments. Advisers who worked with the institution in the first instance would be helpful in servicing the continuity of the plan. ■

AN ARCHITECT VIEWS THE CLIENT'S ROLE IN SCHOOL BUILDING PLANNING

by ROBERT E. ALEXANDER

Richard J. Neutra and Robert E. Alexander, Architects, Los Angeles, California

Mr. Alexander has practiced architecture alone and in partnerships since 1935. Prior to that he worked in various offices in Los Angeles and New York. He has also served as consultant on various government projects, and is presently a consultant for the Government of Guam. Mr. Alexander has a Bachelor of Architecture degree from Cornell University.

In contemporary society, the architect's client is seldom an individual person. In the case of school buildings it is sometimes difficult even to identify the real client. The theory is that the board of education, board of regents or board of trustees act as owners in trust for the people of a district which they represent. Yet, they, themselves, seldom use the buildings and seldom have a background knowledge of construction. The chief administrator, the superintendent of buildings and grounds, the faculty and even the students, all of whom use the buildings every day, must somehow be brought together with the trustees or policy group in a cooperative effort to represent the client, who is ultimately the people themselves.

Perhaps cooperative planning is taken for granted. As we all know, many an educational institution has been designed from a set of space requirements, presented by the department of buildings and grounds or some executive office to the architect, who has then produced the design without further reference, other than his own intuition or past experience, to the detailed activities or the philosophy behind the school. Very often his goal and the measure of his success is determined by winning the board of trustees through the presentation of pleasing sketches, without detailed reference to the activities within the buildings.

The architect is asked by a donor or by the board to show what the buildings will look "like." This expression gives itself away. Looking "like" something is not the same as being. The request presupposes a fraud or imitation of the real thing. This method of approach, of course, might be carried out brilliantly. An architect with great intuitive insight and broad experience might produce a superior design which satisfies not only the board of trustees and the public, but the faculty and students as well. We are convinced, however, that even in the rare instances when this method appears to produce satisfactory results, the institution would have gained precious advantages if cooperative planning had been employed.

Cooperative Planning Is a Search

Cooperative planning is an honest search for the truth in building. The process itself is even more im-

The merchandising laboratory of the Business Education Building at Orange Coast College has a variety of display cases and windows to accommodate the class projects.

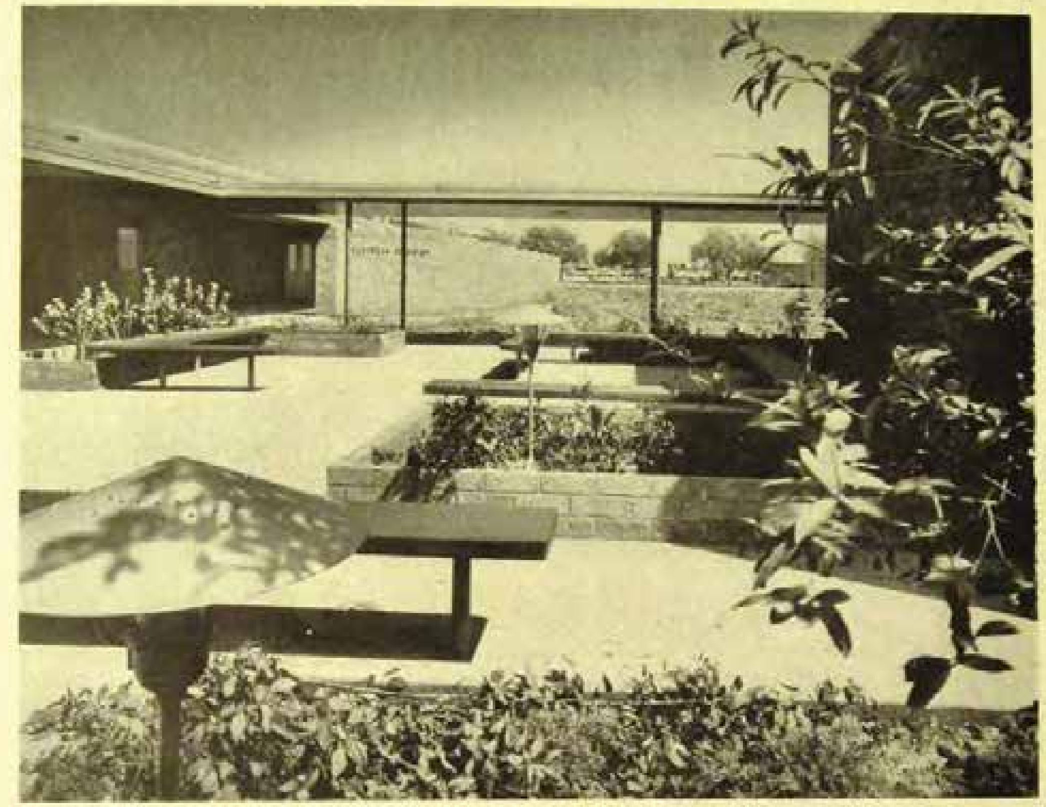
The secretarial laboratory has a switchboard and different types of office machines. A sliding partition at the front of the room separates the duplicating machines area.

portant than the building it produces. When conducted properly, it gives the many people who will occupy and use the buildings a real sense of participation, ownership and pride in the product. It fails in this, of course, if the faculty and students involved treat it merely as a necessary chore to which they are asked to devote extra hours without compensation.

When the buildings are finished, occupied and used, every instructor should feel that he at least had a voice in planning decisions. A new faculty member, coming years later, should still feel the effects of faculty solidarity and general satisfaction. He should be able to see that these are buildings in which the users themselves, that is, the real clients, had something to say which was heard and heeded.

As architects, our main professional satisfaction is derived mostly after the buildings have come to life and are found to suit their purpose better than anyone could have dreamed. Where the analysis of methods, activities and curriculum comes first and the design comes second, flowing out of them, we are convinced that we stand a fine chance of success. An investment, on the part of a faculty member, of a few hours of time in cooperative planning may easily save him and his successors countless hours and headaches in the years to come.

Assuming that cooperative planning takes place, the client's functions might be divided into two categories. One, usually handled by the policy board or by a buildings and grounds committee of the board, would include the decisions which establish aims and objectives. The second is to define the educational program and to begin the building plans. This is best handled by a building committee, composed largely of faculty members, the chief administrator and at least one member of the policy board. Invaluable guidance throughout the entire planning process is sometimes furnished by an educational consultant.



The courtyard of the Business Education Building is a pleasant outdoor area with benches placed near the planting sections.

In addition to the board members, the chief administrator, the superintendents of business and buildings and grounds and the leaders in education or deans can help to establish the client's aims and objectives. We have also found it highly desirable to include one or more students on the building committee, especially when such buildings as the student center, the auditorium, the gymnasium or any general use buildings are being considered. Buildings and grounds should also be represented on every building committee, unless there is a separate group which reviews plans.

Define Fundamental Aims

It has been found that the definition of fundamental aims of a building program is often neglected. One of the most important of these neglected items is the quantitative goal of the institution. What is the ultimate student capacity? If construction is to be accomplished in stages, what is the immediate planning goal? Either decision should be made officially and recorded as fundamental policy.

Although there is little need to involve the architect in a decision on student capacity, there is every reason for bringing him into the picture when budgets are being determined. The development of the budget should be a cooperative effort. It is quite clear that many non-architectural factors may determine a budget. The wealth of a district, the public relations policy of the board and competition for funds by other agencies must be taken into consideration. It is a frequent mistake, however, for the client to attempt to establish a building program and a fund raising plan without the full collaboration of the architect.

The most active participation of a client in the cooperative planning process comes to play in building committee meetings. Our first step, in organizing information regarding a specific building, is to distribute planning outlines to building committee members prior to the first meeting. This is a questionnaire to be filled out by individuals and designed to bring out differences of opinion before any committee discussion takes place. In addition to the questionnaire, we sometimes provide sketches of floor plans, in schematic form, of various elements of the proposed building. Although

Alexander, Robert E. "An Architect Views the Client's Role in School Building Planning." *American School & University* (1955-56). Source: Robert E. Alexander Collection, Division of Rare and Manuscript Collections, Cornell University Library.

Draw drapes close off the doors and windows of the merchandising laboratory when necessary.

this practice might result in unfortunate preconceptions, it is pointed out strongly that these are simply test plan sketches intended merely to stimulate concrete and specific suggestions, rather than general discussion. After questionnaires are distributed, we visit classrooms in session and observe the activities as they are being carried out in existing facilities.

When the questionnaires are returned, they are digested and conflicting answers are tabulated. A diagrammatic sketch is made of the proposed building, incorporating the answers to the questionnaire in notes wherever possible. Copies of the plan are distributed to committee members at the first meeting of the building committee, at which time we explain the plan and the reasons for our decisions. Discussions and criticism ensue and a record is made of decisions by the building committee. Preliminary plans are revised and presented at a subsequent committee meeting, and the process is repeated until the committee is prepared to recommend the plan to the policy board.

Planning Problems

There are several problems connected with the cooperative planning method which can be solved only by the client. Strong and wise administration is sometimes required to hold down the skyscraping ideas of one faculty member, while encouraging and stimulating the response of another. In this way a proper balance is maintained among departments or divisions of the same department. Another problem is presented by the faculty member whose ideas are so extraordinary that they might result in an inflexible space. Such a space could not be converted easily for other uses. Most educational buildings have a longer amortization period than the teacher.

Constant and careful cost estimating and reporting by the architect, backed up by strong control at the head of the committee, will sometimes be required to keep faculty requests in line with the budget established by the board. On the other hand, when budgets are established without reference to the real needs of the program, waste of funds often results.

Cooperative planning requires plenty of "blood and sweat," but we are convinced that it saves the tears. In spite of the work involved for both client and architect, or rather because of it, the system itself is intrinsically important in planning school buildings. If we wanted to raise peaches, we would hardly plant a prune pit. Cooperative planning is the systematic seed from which good buildings grow.

VERSATILE FACILITIES FOR TECHNOLOGY

WILLIAM F. KIMES, and
ROBERT E. ALEXANDER

The basic principles of planning used for other types of instructional areas may also be utilized for a technology building. However, it must be emphasized that the more complicated and involved a building is, the greater the need for careful educational planning. Recognizing this, it is common practice to work out an agenda for directing the educational planning for each building. Presented here are the procedures followed at Orange Coast College to solve their building problems.

The philosophy of education at Orange Coast College is based upon the premise that it is a community-centered institution. Consequently, the college offers the best of academic opportunities in areas of general education as well as vocational or trade training for students who wish to complete their education in two years. Approximately one-half of the regularly enrolled students pursue the terminal program. Several thousand adults make use of the college facilities, particularly in the fields of technology, as a means of improving their vocational skills. The stated purpose of Orange Coast College is to teach all of the people of the community all they wish to know, or are qualified to learn, in all the areas in which there are opportunities for employment or for further education in institutions of higher education.

OCCUPATIONAL SURVEY

To determine the areas of employment for which this community college should train students, a careful and intensive study was made of the vocational and professional opportunities of the district before the college commenced instruction in 1948. Two re-surveys have been made since that time. The original survey indicated sufficient job opportunities within the district in building trades, engine mechanics, metal trades (including welding), petroleum technology, and mechanical drawing to warrant providing facilities for instruction in these areas. Re-surveys showed needs in the fields of

80

Alexander and Kimes. “Versatile Facilities for Technology.” In *New Dimensions in Junior College Planning* (Stanford University School Planning Lab, 1958): cover page and page 80. Source: Education Information Resources Center, http://eric.ed.gov/

radio-television technology and electronics. Orange Coast conducted the courses for the first year in temporary army buildings, giving instructors the opportunity to carefully determine the needs for the permanent structures. These instructors found that teaching a course in an inadequate area served as a strong stimulus to carefully plan the permanent structures.

As planning progressed, the architect determined that the funds available for construction were sufficient for only half of the facilities desired. Each member of the faculty committee seemed to feel that it would take at least half of the available budget for his program alone. Unavoidably, philosophies of instruction must often be influences by the amount of money available to provide housing for the several programs. At times administrative decisions were necessary to maintain realism in the face of divergent interests and objectives.

FACILITY PLANNING COMMITTEES

At Orange Coast facility planning committees have traditionally met under the leadership of the superintendent. Members of the Board of Trustees have always been invited to participate in the committee discussion. The District has been fortunate in having at least two members who have had the time and interest to serve on building committees. In addition to faculty members, a Board member, and the Assistant Superintendent in charge of Business, two students have been included on each building committee. While the students probably gained more than they gave, often the students have had real contributions to make.

Lay persons from the trade and vocational committees were not included on the building committees. The Orange Coast administrators felt that the instructor in the field, who was a member of the trade advisory committee, could adequately represent the trade in planning educational facilities.

For a facilities planning committee to be effective a plan or agenda for the meeting must be prepared by the administrative chairman. Sufficient time must be allotted for each meeting and, of no less importance, there must be sufficient time between meetings, so that the ideas of the committee may develop. At Orange Coast College the committee for the Technology Building was in session over a period of six months. The architect prepared no less than eight floor plan revisions during this period.

ADMINISTRATIVE LEADERSHIP

Administrative leadership, diplomacy and statesmanship are required to promote the best work of a faculty committee without having the individual members feel that they are being "yes men" for the superintendent. It has long been recognized that a corporate mind is superior to the sum of the several individual minds. In short, the give and take of a group of competent and interested persons brings out ideas that no individual of the group is capable of creating.

The key person is the administrator to whom falls the responsibility of holding the overly enthusiastic faculty member to the budget and at the same time drawing out the best in the quiet and retiring member of the faculty. The administrator is the only one who can tell the faculty members what he can have. This is not the function of the architect. Even where the architect has been directed to a particular committee member to work out details, it is still the responsibility for the administrator to make the final decisions.

Finally, it should be remembered that faculty members, administrators, board members, and architects come and go but the taxpayer expects the building to be there a long time - a half century or more. It takes the highest kind of educational leadership to direct the planning of a functional, flexible, adequate building that is within the financial ability of the community. The buildings must implement the curriculums, not determine them. The faculty of Orange Coast feels that their Technology Building meets these principles to a reasonable degree.

CURRICULUM DICTATES FACILITY PLANNING

The field of technology covers a number of separate disciplines or trades. Those included in the curriculum of a particular junior college will depend upon the nature of the community in which the college is located--what a community survey reveals are the interests and needs of the area.

Orange Coast College decided to make its wood shop a building trades center, not a cabinet mill. If the college had been located in Grand Rapids, Michigan, the facility probably could have been best oriented toward the manufacture of furniture. Even though the college was located in a semi-rural area when the college was begun in 1947, it was quite obvious there would be great opportunities in the building trades. This stimulated plans to provide something that was guite different from the normal secondary school vocational program, in which basic carpentry, plumbing, and electric wiring is taught.

At Orange Coast College the classes were extended into the out-of-doors. This necessitated the provision of areas in which several

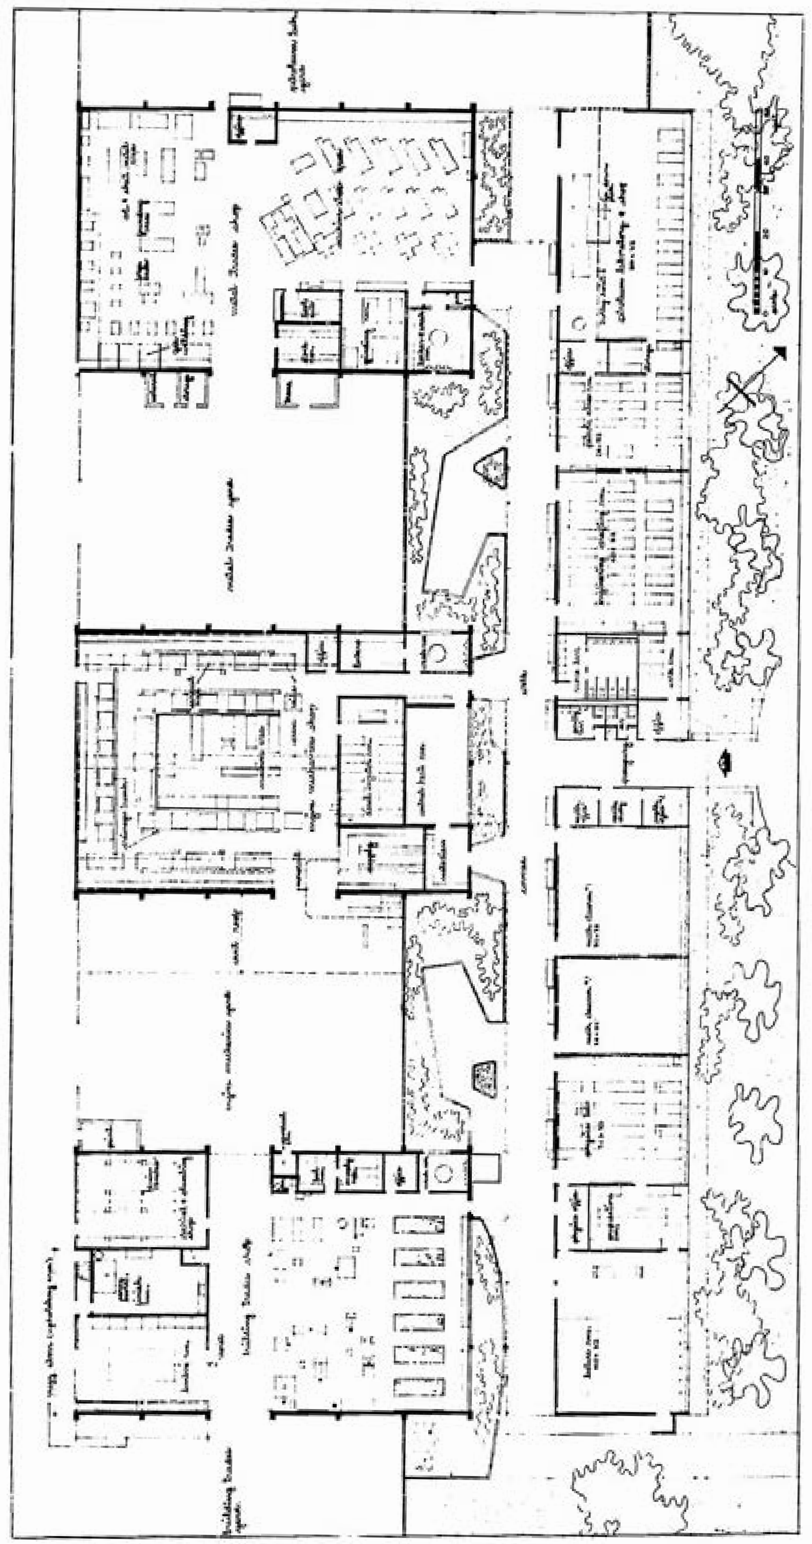
Source: Education Information Resources Center, http://eric.ed.gov/



Floor plan of the multi-unit Technology Building, Orange Coast College, Costa Mesa, California

houses could be built. The first classes poured the foundations and succeeding classes layed the floor joists, framed and finished the homes. The students actually frame and tear down a half dozen houses during each semester. They also do a certain amount of plumbing and wiring. All of this requires a rather large portion of outdoor space. The nature of the activities further conditions the locations on the campus where these activities may be conducted. The buzz saws, hammers and other tools create a considerable amount of noise. The area must have easy access for trucking large pieces of machinery and bulky materials.

The woodshop portion of the building trades structure is one of the very few "clean" facilities existing. This was made possible by including a four foot crawl space below the wooden floor and using extensive blower equipment. Every machine that makes wood-chips, shavings, or sawdust is directly connected to a blower system which blows the waste out of the building. In addition, sawdust traps are located in the floor. The sawdust is carried from these receptacles into a closet located near the outside wall which facilitates disposal.

The main accent in the engine mechanics area is on diesel engines, farm machinery, and marine engines. The latter is important because the college is very close to the largest small boat harbor in California. The shop in which marine engine technology courses are taught is equipped with a universal traveling crane capable of lifting three-ton marine engines. This building includes an exhaust system which makes possible operating an engine inside and exhausting outside the building. A water pipe is located next to the exhaust connections for water cooling these motors.

The petroleum technology program at Orange Coast College concentrates on field work, exploration, and geology, preparing qualified persons for the oilfields in nearby Huntington Beach. By agreement between Orange Coast and Los Angeles Harbor College the latter offers a petroleum technology program oriented toward the type of laboratory work conducted in refineries.

In developing the facilities for the petroleum technology program the architects and the faculty sought examples of existing facilities which might be visited and studied. However, since there were no existing educational institutions which had a program of the size and type envisioned by the college authorities, the college relied upon the petroleum industry for ideas and information. A model oil well, another example of the extension of the teaching area into the out-of-doors, pumps oil from a storage tank to the well and then back to the tank. Completely equipped as a functional field unit, this facility provides a realistic field experience for students.

The type of facilities required to conduct a petroleum technology

84

Alexander and Kimes. “Versatile Facilities for Technology.” In *New Dimensions in Junior College Planning* (Stanford University School Planning Lab, 1958): pages 83-84.
Source: Education Information Resources Center, http://eric.ed.gov/

pair of stations providing sufficient depth to fill or wash flasks or beakers. Extending the full depth of the table, it serves four students, each of whom has plenty of water within reach. Two students share a faucet and each has a separate aspiration, gas, and electric outlet. Compressed air and steam lines were omitted. When steam is available on campus generally, it is included at little cost. Warm air is desirable for glass drying, but care must be taken to keep it free from oil.

A sink at the end of the table, with a high faucet is used for filling unusually long tubes, and one central sink in the room contains a distilled water outlet and an eye washer. Additional distilled water stations would be convenient, but the block tin pipe required is expensive. Two table ends contain first aid fire blankets. The shower required by some codes was considered unnecessary.

A table height of three feet is standard and satisfactory. Space between tables varies from a crowded four feet to over five feet. Five feet was agreed upon but the instructor wishes it had been seven. Station widths vary from three to six feet; four and a half feet plus the sink width was the linear dimension chosen. Except in the organic lab, an improvement can be made by reducing the utility rack height in the center of the table to about nine inches. This permits a better view of demonstrations and better supervision.

These ideas may be incorporated into various room arrangements. If the class size can be kept small, an ideal plan might distribute clusters of four stations each around the perimeter of the room, leaving the center flexible and free for report writing and lectures. The population pressure in community colleges, however, usually calls for maximum class sizes, often resulting in more concentrated grouping. At Orange Coast College an eight-station table was placed in the center, and two twelve station tables at the outside, leaving space for a portable demonstration table in an ideal viewing location.

Every college visited had at least one hood with a sliding glass door. No instructors recalled ever using the door so it was decided to omit it and extend the hood the full width of the room, enabling the entire class to use it at one time. All air exhaust is brought through the hood, and no air is returned. A three minute air change provides ample ventilation. A greater flow of air produces an undesirable draft. Special hoods for radio-active or other hazardous work will probably see more use even in junior colleges in the future. Since they may be provided as portable equipment, suitable exhaust connections should be installed.

A mistake observed frequently was the instability of balance tables. Many are attached to the building, making them subject to vibration.

SCIENCE: FACILITY DESIGN

ROBERT E. ALEXANDER

Every Community College facility should be planned for the specific needs and program of the particular institution. The example presented here is the Science Building of Orange Coast College, which was planned with few preconceived notions. It is not intended to serve as a prototype to be duplicated without careful analysis and comparison with other possibilities.

Policy decisions were made by the Building Committee, headed by the President, and including the Science faculty and the Superintendent of buildings and grounds. Decisions were based on alternatives suggested by the architects after reviewing written program requirements and after visits to seven community colleges, three universities, and the office of the State Architect. The method of study and the planning procedures may be repeated with success.

PHYSICAL SCIENCE FACILITIES

The principal adverse criticisms encountered in our survey of science facilities dealt with laboratory furniture. The central trough so common in chemistry tables is difficult to keep clean and water splashes out of it a distance of several feet. To prevent splashing, some faucets had been fitted with rubber tubes, making them even more difficult to use. The typical deep end sink in such installations provided the only suitable water supply for most purposes. It was always crowded, resulting in loss of time and glass breakage. Individual "cup sinks" were universally denounced as an abomination, even worse than the trough.

The design developed to overcome these objections has proved highly successful, although the instructor is not convinced it is "necessary." An eighteen inch deep tub is placed between each

90

Source: Education Information Resources Center, http://eric.ed.gov/

pair of stations providing sufficient depth to fill or wash flasks or beakers. Extending the full depth of the table, it serves four students, each of whom has plenty of water within reach. Two students share a faucet and each has a separate aspiration, gas, and electric outlet. Compressed air and steam lines were omitted. When steam is available on campus generally, it is included at little cost. Warm air is desirable for glass drying, but care must be taken to keep it free from oil.

A sink at the end of the table, with a high faucet is used for filling unusually long tubes, and one central sink in the room contains a distilled water outlet and an eye washer. Additional distilled water stations would be convenient, but the block tin pipe required is expensive. Two table ends contain first aid fire blankets. The shower required by some codes was considered unnecessary.

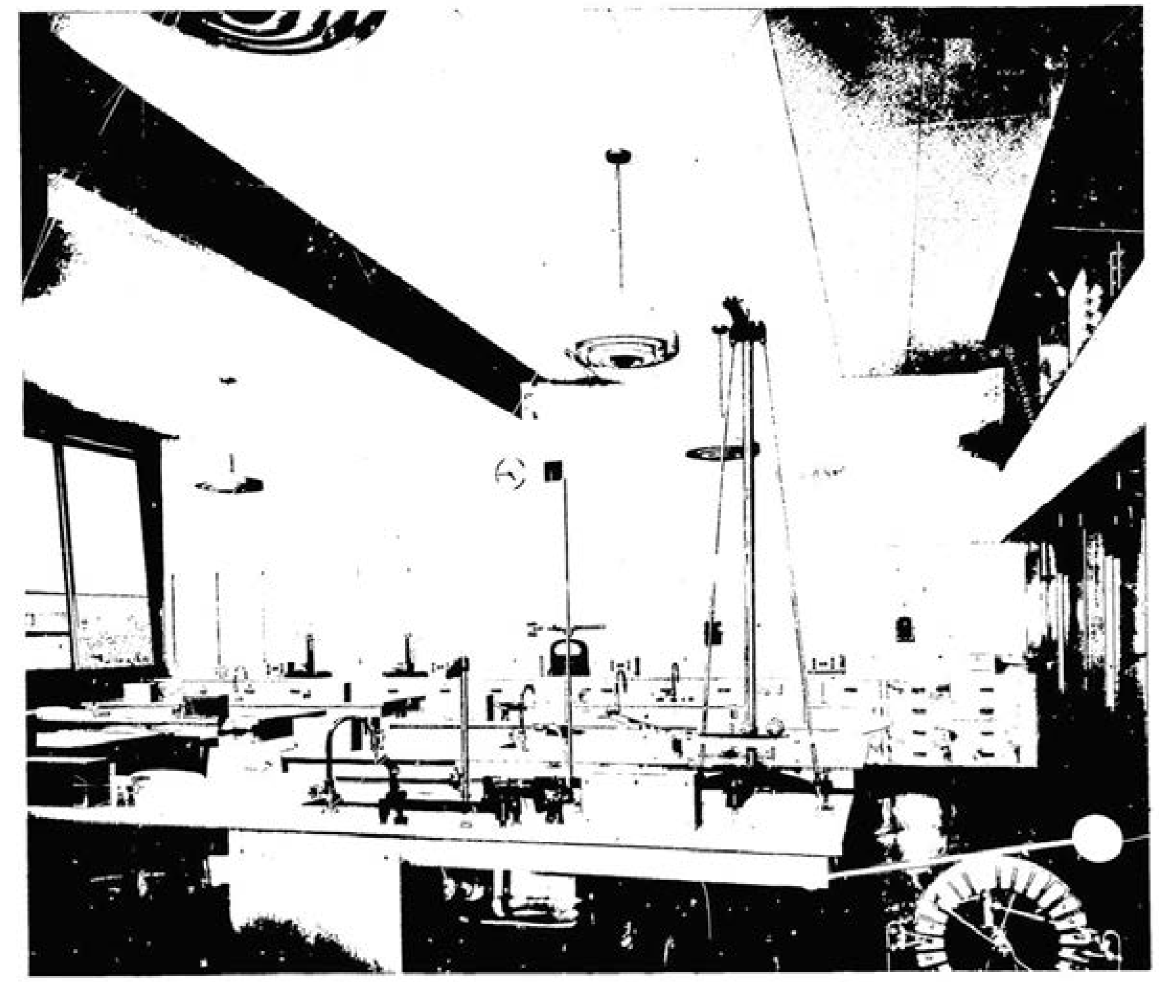
A table height of three feet is standard and satisfactory. Space between tables varies from a crowded four feet to over five feet. Five feet was agreed upon but the instructor wishes it had been seven. Station widths vary from three to six feet; four and a half feet plus the sink width was the linear dimension chosen. Except in the organic lab, an improvement can be made by reducing the utility rack height in the center of the table to about nine inches. This permits a better view of demonstrations and better supervision.

These ideas may be incorporated into various room arrangements. If the class size can be kept small, an ideal plan might distribute clusters of four stations each around the perimeter of the room, leaving the center flexible and free for report writing and lectures. The population pressure in community colleges, however, usually calls for maximum class sizes, often resulting in more concentrated grouping. At Orange Coast College an eight-station table was placed in the center, and two twelve station tables at the outside, leaving space for a portable demonstration table in an ideal viewing location.

Every college visited had at least one hood with a sliding glass door. No instructors recalled ever using the door so it was decided to omit it and extend the hood the full width of the room, enabling the entire class to use it at one time. All air exhaust is brought through the hood, and no air is returned. A three minute air change provides ample ventilation. A greater flow of air produces an undesirable draft. Special hoods for radio-active or other hazardous work will probably see more use even in junior colleges in the future. Since they may be provided as portable equipment, suitable exhaust connections should be installed.

A mistake observed frequently was the instability of balance tables. Many are attached to the building, making them subject to vibration.

91



Interior view of the physics laboratory, Science Building, Orange Coast College, Costa Mesa, California

Heavy concrete platforms resting on a slab insulated from the building and resting on separate foundations should be used. Table height is frequently too low or too high. Two feet eight inches are best for working from a stool, from which most of this painstaking work should be done. Material selection constitutes a real problem. Steel

92

Source: Education Information Resources Center, http://eric.ed.gov/

screw-heads, lighting fixtures, register, etc. showed signs of rust even in new installations. Stainless steel, coated with pitch or asbestos-cement, may be used for ducts. Asbestos-cement was selected for the hoods and glass blowing tables. Stone table-tops and sinks are expensive but stand up well. A thirty-year old installation the committee checked looked beautiful. It was waxed once a week. Orange Coast College used a more economical patented material in which the dark colors are the least subject to staining. It may be repaired or renovated easily. No flooring is perfect, but vinyl tile may prove best, and can be replaced. Silver nitrate will mark almost any material otherwise satisfactory.

The stock room policy is an important determining factor in planning. The pre-arranged tote-tray containing materials required for a specific experiment will probably gain favor as student volume pressure and intensity of instruction develop. Where only two labs are served, the pigeon-hole wall, with tote-trays sliding through, seems a good idea, but it requires wall space even there. The central store room is needed where several labs are to be served. Seldom is sufficient space allowed for storage and preparation within the area, or for students outside. Decentralized stores are wasteful of material, space, and manpower.

The faculty requested direct access from the preparation-store room to the service entrance, three laboratories, and a lecture-demonstration room. "Seeing-eye" control of two labs from the office and of the balance room from two labs was requested. They also wanted the office to be accessible from two labs and the corridor, and two labs had to have access to a small instrument room. This series of requirements resulted in a cluster plan which provides maximum compactness, but limited flexibility for expansion.

The survey of physics facilities revealed several examples in which maximum flexibility was the objective. Service centers containing all utilities were distributed around the room, permitting a variety of loose table arrangements. Although it is used in such advanced laboratories as that at the U. S. Naval Academy, it should be clearly understood that flexibility is incompatible with sturdy stability required for many experiments. Sockets frequently provided in table tops for inserting rods were also criticised as impractical. Heavy duty clamps on firm, fixed bases are preferred.

At Orange Coast College, eight two-station tables built of two-inch thick maple stock, bolted to the floor were provided. Each bench contains a sink, two gas cocks, and two variable voltage stations. A central panel provides A-C or D-C current in a variety of voltages to any station. It eliminates the mess of wet-cell batteries, but does not provide the precision required for advanced work. Four concrete piers are distributed at table ends for optical work. A room which

can be completely darkened is necessary for demonstrations in optics. Even a "blackout" room without windows failed in one installation observed, because the exhaust ventilator admitted a faint fractional foot-candle. Stability is also provided by a wall of heavy T and G paneling. A concrete wall contains vertical slots and sliding bolts for firm attachment of instruments. A storage-preparation room serves both laboratory and demonstration-lecture room, used by physics and life-science classes.

LIFE SCIENCE FACILITIES

The survey of biology labs indicated that few tables are designed for microscope work. Tables thirty-seven inches high forced students to stand during the entire period even where adjustable stools were provided. The standard thirty inch height denies comfortable microscope work sitting or standing. Tables twenty-seven inches high were used with success.

Microscope storage also presented difficulties. When they are stored at the table, to reduce breakage, the student has no knee room and they may be easily lost. They may be stored in a cabinet behind glass doors, or bolted to a spring drawer so they pop out like a "disappearing typewriter."

Four six-station tables are provided in each room. This serves well for lecture and demonstration as well as laboratory work. A sink separates each pair of students and each one has an electric outlet, a gas connection, and a twelve-inch wide drawer. It was found that a dark-colored fiberglass is a satisfactory material for sinks and tops. Methaline blue and other stains are hard even on stainless steel. A hood is provided for lamp-blacking paper. Cats are stored in drums vented to the outside by faculty preference, but a good arrangement observed stored them in plastic sacks on sliding shelves.

Where the budget permits, a museum is an important teaching tool and a community asset. An orderly means of storing, exhibiting, and transporting small material is by mounting it in the bottoms of drawers of standard size. The top row of drawers can then be made visible through a glass counter-top, and drawers may be inter-changed easily and frequently. They may be removed readily for classroom use. Thus a storage room for demonstration material may serve also as a stimulating local natural science museum.

An animal room and a greenhouse separated by a work room are provided at Orange Coast College opposite life science rooms across the corridor. A glass wall on the corridor side makes the aquarium, small animals, and plants visible as a display. Shades permit screening at times when desired. The opposite side borders a garden for

Source: Education Information Resources Center, http://eric.ed.gov/

raising live plant material. The entire landscape plan was designed to provide specimens related to the study of botany. A reflecting pool, sectioned for various uses, provides a place for growing water plants and animals. A separate source must be provided for heating and ventilating spaces where live material is stored. Otherwise sudden temperature changes over weekends or even at night may destroy an entire collection.

THE PLANETARIUM

An interesting teaching facility at Orange Coast College is the Planetarium. When built, it was unique in junior college buildings. A projector developed during the war for teaching navigation makes it economically feasable. The proximity of Orange Coast College to Newport Harbor, a small boat center, made it seem unusually appropriate. It was designed fundamentally as a classroom, however, as a day-time teaching aid and as a unique community asset. This combination is not recommended.

Due to the economical design of the pin-hole type projector, the dome was limited to a diameter of twenty-four feet. The floor is extended past the dome to accommodate a full class in tablet arm chairs for general science demonstrations. A chalkboard, cabinet, and sink

Floor plan for Science Building, Orange Coast College, Costa Mesa, California

add to its general utility, providing an interesting experiment in classroom form. Storage is provided for the projector and for folding chairs when it is used as a classroom. The acoustical problems in a circular classroom with a full domed ceiling are intense. A telescope mounted on a nearby roof is used in combination with the planetarium for the study of astronomy.

The planetarium dome, illuminated and reflected in the pool, forms a focal point at the entrance to the Campus. The chemistry laboratory cluster forms a nearby appendage to the long strip of life-science, physics and general science labs and the mathematics classrooms facing North-East. Following the policy of the Campus, a small patio provides a place for students to sit outside between classes. A simplified astrolabe, resting on a base sculptured by Peterpaul Ott, graces the entrance to the building, symbolizing science.

Designing for Science at Orange Coast College

by ROBERT E. ALEXANDER

FAIA, Richard J. Neutra and Robert E. Alexander, Architects, Los Angeles, California

Mr. Alexander is a graduate of Cornell University's College of Architecture. In New York City he worked on the 80 story Metropolitan Life Insurance Office building and was in charge of floor plan production of Metropolitan's Parkchester housing project. After coming to California he practiced as a partner in two successive firms before establishing his own practice in 1946. Mr. Alexander's firm has produced a variety of commercial and institutional work. His designs have won many prizes and have been published in the USA and abroad.

IGNORANCE can be an asset in planning a new building, if the architect will apply keen observation, hard work and the fundamentals of architectural organization and design. As is our custom, we approached the design of the Orange Coast College, Costa Mesa, California, Science Building as if we had never before planned such a building or even taken courses in chemistry, physics or biology.

This attitude of naiveté is essential to the development of an original design specifically suited to the needs of a particular institution. It prevents the repetition of inadequate facilities and planning mistakes which are so common that they are usually taken for granted.

After reviewing a tentative program to guide our observations, we inspected science facilities in seven similar colleges and in three universities. On these visits we were accompanied by some members of the faculty building committee. Host faculty members were generous with their time and effort and fascinated with the chance to show us good and bad points encountered in operating their facilities.

Most installations were new, but one was twenty-seven years old, providing a good test in time not found in recent examples. We made copious notes, measurements and sketches, and compiled our observations in book form for our faculty committee, headed by Dr. Basil Peterson, president of the college.

The office of the California State Architect was unusually helpful in sharing its treasure of experience. Staff members readily showed us many plans and specifications, and discussed our observations in the light of their own diverse experience.

We Uncover Problems

We found that the most common problem concerned the chemistry tables. The traditional narrow central trough, draining to the end, was severely criti-

Alexander, Robert E. "Designing for Science at Orange Coast College." *American School & University* (1955-56): page 1 of 8. Source: Robert E. Alexander Collection, Division of Rare and Manuscript Collections, Cornell University Library.

cized. Water splashes out to a distance of several feet. Short hose lengths, added to faucets to avoid splashing, are suitable only for filling test tubes, if suitable at all. Anyone who wants more than a thimbleful goes to the deep sink at the end of the table, where he fights his way through a mob doing the same thing.

This "water hole" design was not a success even where a deep sink was provided at each end of an eight station table. Paper towels, match sticks and other flotsam and jetsam usually clogged the trough which was found almost impossible to keep clean.

The use of so-called "cup sinks" would not deserve the dignity of mention if they had not been observed in recent installations. Apparently few other devices will turn a chemistry instructor into a wild man. They were universally denounced as monstrous, even for eye-dropper work, in any section of science.

The solution found most satisfactory is a standard eighteen-inch deep sink, extended the full width of the table and serving four students. Refuse jars may be placed below. This arrangement gives every student immediate access to water and enough depth to fill a flask or wash a beaker. One faucet serves two students, and each student has a separate aspirator, gas and electric connection.

The circular general science classroom has a planetarium projector.

Each table has a deep sink and high faucet at one end for filling king-sized tubes and for other general use. An extra end sink, centrally located, contains a distilled water supply and an eye-washing device for accidents.

External form of the circular general science room is a focal point of interest as seen from the main entrance road. The room is used for demonstration and lecture purposes and is an interesting experiment in circular classroom design.

Life science laboratory was designed after study and examination of such accommodations in other colleges and universities. Special attention was given to table heights for comfortable work with microscopes.

have ample suction to lift heavy gasses to the roof. Asbestos cement appeared to be the most serviceable, inert material for hood construction. This material was also u..ed for the glass-blowing tables. Two sinks and 32 gas cocks were provided for each hood.

On Sunlight and Balance

Two pet peeves were discovered among chemists. Sunlight is the chemist's worst enemy. Screen out even the smallest beam! And make the balance tables rigid. A student may wait five minutes for the balance needle to come to rest, only to have a neighbor touch his table, forcing him to tear his hair and start over again. Yet we found wooden shelves hung on walls subject to every vibration of the building and light-weight, free-standing, wooden tables with legs begging to be kicked!

We cast heavy concrete benches, separated from building walls on small slabs insulated from the building slab, and resting on separate foundations. The benches are 2 feet 8 inches high and a student can take a reading without developing curvature of the spine.

Since the ultimate program for the Orange Coast College Science Building contemplates three chemistry

A small greenhouse and animal room were provided across the corridor from the life science laboratories. A common workroom separates the two areas and leads into a small garden where plant material is raised for special experiments.

labs, direct service from the storage and preparation room was requested. The faculty also requested visual control of laboratories from the office, access to the office from a corridor, access and visual control from two labs to the balance room, and access from two labs to a small instrument room. The lecture room was also to be served by the storage-preparation room, and the storage room was to be accessible to a service drive. This set of requirements could only be met by a "cluster" arrangement, as illustrated.

Master Plan Is Followed

Planning policy of the remainder of the building follows concepts determined in 1948 for the entire campus. Large windows face northeast and clerestory windows, on the southwest above the open corridor, are shielded by horizontal louvers. Three classrooms are used for general purposes including mathematics and surveying. One will be converted in the future to a general science lab. One room contains tablet arm chairs and another has small tables suitable for cartography. A math calculating room, office and surveying instrument storage room complete this group.

A general science room contains 8 two-station tables equipped with water, electricity, gas and air. A demonstration table occupies the front, and the rear wall contains metallurgical equipment for a materials testing course. Galvanized iron is used to take abuse and heat on the bench top. An office and storage room will ultimately serve two general science laboratories.

The Physics Lab

A variety of physics laboratory arrangements was observed. Maximum flexibility is often requested in such spaces. In most installations a common corollary of flexibility was observed. It is almost impossible to get the stability or firm, steady support required by many experiments. The utility islands should be supplemented by more than simple tables. Another failure was also noted in the commonly used sockets built into tables for inserting vertical rods. Sturdy clamps on firm, steady bases were recommended.

A physics lab, built on the Orange Coast Campus in 1949, had proven successful, and its best features were duplicated. Eight two-station benches with 2-inch thick maple tops were bolted to the floor. The ends of four benches contain solid concrete piers for optical stability. Each bench contains a sink, two gas cocks, and two variable voltage stations. A variable voltage panel previously found satisfactory for use in this college was used again, although nothing but an elaborate wet-cell battery bank is considered adequate for D-C work in many institutions.

A heavy side wall is sheathed in tongue and groove wood paneling for attaching instruments at will, and the rear wall contains bolts in slots for firm attachment. An office and a preparation-storage room serve both the lab and a demonstration lecture room. The latter is also used by life science classes.

Accommodations for the "life sciences" also varied widely in the colleges examined. A common problem encountered was the table height for microscope work. Many tables were as high as 37 inches. Even with adjustable stools, most students were standing for an entire lab period. The usual 30-inch table height will not permit comfortable microscope work either sitting or standing. We settled on a 27-inch height as maximum. Careful detailing should avoid aprons or other obstructions to knee room.

Special Storage Spaces

We found that storage of microscopes was handled in different ways. When stored in the table, there was the problem of pilfering. Frequent damage in handling was reported. For the Orange Coast Science Building we used a central storage cabinet with glass doors so that the microscopes are visible at all times, and there is extra knee room. One good solution, which we used in another case, houses the microscope in a drawer similar to a "disappearing" typewriter drawer. When the drawer is pulled open, the scope springs up to proper height at the side of the student. It is bolted to the frame.

In some situations drawers were only large enough to contain an eyedropper, slides, a pair of scissors, a probe, a 4H pencil, and a razor blade or dissecting kit. Some instructors prefer this, but others insist on sufficient size to include notes, paper and course outline material. We decided on the latter, calling for a 12-inch outside width. Four 6-station tables are provided in

The firm of Richard J. Neutra and Robert E. Alexander, Architects, inspected science facilities in seven colleges and three universities as preparation for designing the new Science Building for Orange Coast College, Costa Mesa, California.

Photos by Julius Shulman

each room, rather than individual tables. A double electric outlet and gas connection are available for each station, and a sink is located between each two stations in a 5-inch high rack at the rear of the 26-inch deep table. The arrangement is ideal for combining lecture, demonstration and lab work.

A common problem in the physiology laboratory is the staining of table tops and sinks. Even stainless steel, excellent otherwise, looks messy in time. We used a dark fiberglas sink successfully, and would have used plastic table tops except for cost. Hardwood tops, varnished with a special plastic lacquer, seem to hold up well for a reasonable time.

A small greenhouse and animal room have been provided across the corridor from the life science laboratories. They are separated by a common workroom, which opens onto a small garden for raising plant material. The corridor wall of these rooms is glass, providing an interesting exhibit of plant material, squirrel cages and aquariums.

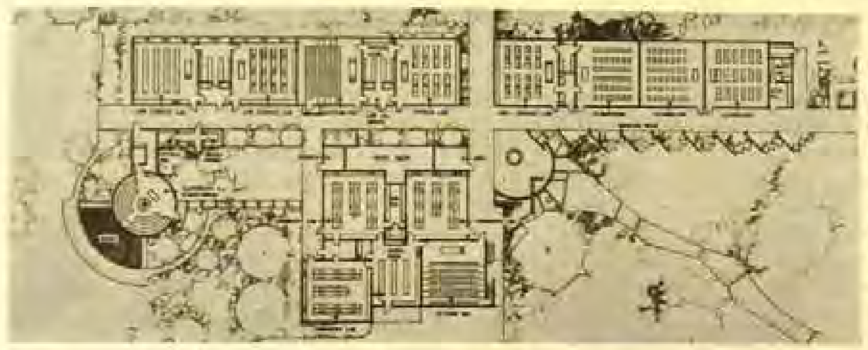
Additional exhibits line the corridor walls of the life science laboratories, and an exhibit of fossils and rocks is housed in the entrance to the Planetarium. Separate humidity and temperature control is provided for the animal room and greenhouse so that live material will not suffer when classrooms are not in use.

The College Planetarium

A feature of the Orange Coast building is the Planetarium. Based on the use of an inexpensive pinhole projector type of planetarium, the dome could not exceed a 24-foot diameter. To accommodate a full class at tablet arm chairs, the room was extended below the dome. The room is used for demonstration and lecture purposes, providing an interesting experiment in circular classroom design.

The focal point of the dome is necessarily very close to the ear of a person standing at the center of the room. Absorption material compatible with projection will only slightly reduce the effect of sound focus at this point. The effect on the audience, however, is quite satisfactory due to high absorption at the walls. The instructors, fully aware of the problem, have accepted the echo when lecturing for a "show." For other purposes they stand at the chalkboard or demonstration table, where the effect is not noticed.

The room forces a psychologically satisfying grouping conducive to seminar discussion. "Blackout" conditions, necessary for projection, are useful for optical demonstration. The external form is used as a focal point of interest as seen from the main entrance road and reflected in a pool used for raising microscopic "live stock."



Plan of the Orange Coast College Science Building. Planetarium and reflecting pool are at lower left. Wing at upper left houses life sciences and physics. Wing at right has three classrooms and the general science laboratory. Central wing has three chemistry laboratories, storage room and a lecture room.

Other Features of the Building

The building, as a whole, is enhanced by a patio with benches at the intersection of main walks and by a sculptural feature at the entrance. This feature consists of a simplified armillary sphere, identifying the building by symbolizing science. The sculptured base, bench and superstructure were developed by Peterpaul Ott, a sculptor on the faculty. The landscape design contains plant material requested by the botany instructor for demonstration and class material.

Those Who Participated

Architects of the building were Richard J. Neutra and Robert E. Alexander, with Dion Neutra, Robert R. Pierce and C. Howard Miller, associates. Structural engineers were Parker, Zehnder and Associates; mechanical engineer was Boris M. Lemos; electrical engineer was Earl Holmberg and Associates. Eckbo, Royston and Williams were the landscape architects.

The Orange Coast College, Costa Mesa, California, Board of Trustees consists of Walter M. Longmoor, president, Harry B. LeBard, Robert Niblick, Horace Parker and Donald G. Hoff. Dr. Basil H. Peterson is the president of the college, and Charles H. Lewis is chairman of the Division of Natural Science and Mathematics at the college.

1. TABLE OF CONTENTS

2. EXECUTIVE SUMMARY

The purpose of this report is to summarize the field verification, background research, conditions observed at the time of the survey, and preliminary structural evaluations that have been conducted for historical buildings located at 2701 Fairview Road in Costa Mesa, California, as part of the Historic Structures Assessment of the Orange Coast College.

The evaluation that has been performed addresses the seismic resistance of each building, and provides some additional background information and recommendations to further address areas of concern.

The Orange Coast College campus buildings included in the evaluation have been organized by building "complex" and are as follows:

1. Buildings 2 & 4
    a. Building 2 – Stage and Auditorium, Drama Workshop
    b. Building 4 – Music
2. Buildings 7, 8 & 9
    a. Building 7 – Student Success Center
    b. Buildings 8 & 9 – Classrooms and Labs
3. Buildings 12 & 13 – Business Education
4. Buildings 35 to 39
    a. Buildings 35 & 36 – East and West Math Wings
    b. Building 37 – Reprographics
    c. Building 38 - Small Office Addition
    d. Building 39 - Planetarium
5. Buildings 93, 105 & 110
    a. Building 93 – Pool Stadium
    b. Building 105 – LeBard Stadium with Press Boxes
    c. Building 110 – Field House

Note that Building 14 was not a part of this evaluation since it is currently considered non-contributing.

3. TIER 1 SCREENING BUILDING MATRIX

The following sheet contains the ASCE 31-03 Tier 1 Assessment Matrix showing a summary of deficiencies per building, classifying each as major, moderate and minor items. For more detailed information, see individual building assessments in Section 6 as well as recommendations in Section 7.

TIER 1 SCREENING BUILDING MATRIX

COMPLEX	BUILDING		CONSTRUCTION DATES				CONSTRUCTION TYPE									NONCOMPLIANT : STRUCTURAL													NONCOMPLIANT : NON-STRUCTURAL						
	No.	Name	Original	Structural Alteration 1	Structural Alteration 2	DSA File No.	Wood frames, commercial and industrial	Reinf. masonry bearing walls with flexible diaphragms	Steel moment frames with flexible diaphragms	Steel braced frames with flexible diaphragms	Conc. moment frames	Conc. shear walls with stiff diaphragms	Conc. shear walls with flexible diaphragms	Precast conc. shear walls with flexible diaphragms	ESTIMATED LEVEL OF STRUCTURAL MITIGATION REQ'D FOR COMPLIANCE	Deterioration	Proximity of adjacent buildings	Concrete shear walls	Wood shear walls	Steel braced frames	Steel moment frames	Interior mezzanine bracing	Wall anchorage	Wood diaphragm cross ties	Wood diaphragm drags	Wood diaphragm span	Precast wall foundation anchorage	Pile cap anchorage	Ceiling support / lay-in tile clips	Light fixture support in ceilings	Appendages bracing	Equipment anchorage	Tall narrow contents	Flexible pipe couplings / fire suppression bracing	MITIGATION OF DEFICIENCIES

5	110.	Field House	1955	2007	---	12136	X								L	X										X							X		See Section 7 and Appendix A

MATRIX NOTES:

1. No drawings are available for the Planetarium building additions.
2. No drawings are available for the LeBard Stadium West Press Box. It appears as if this structure may not have been permitted.
3. At Building 04, adequate collectors are not present at 1 re-entrant corner location in the roof diaphragm. While this is not specifically noncompliant according to the ASCE 31-03 Tier 1 checklists, this is a deficient condition.
4. At Building 35, Building 38 and Building 105 East Press Box, no lateral force resisting system is present in at least one exterior line of walls.
5. At Building 93 Pool Bleachers, torsional irregularity is present.

M/H	Medium/Heavy
H	Heavy

4. APPROACH

The investigation of the existing building structures was conducted using the criteria outlined in the Tier 1 standards contained in the *ASCE/SEI Standard 31-03 Seismic Evaluation of Existing Buildings* (ASCE, 2003). This was published by the American Society of Civil Engineers with the intent to provide a standard for establishing potential seismic hazards in existing building structures.

This evaluation is based on a desired performance goal of Life Safety as defined by ASCE31-03:

> "Life Safety: Building performance that includes damage to both structural and nonstructural components during a design earthquake, such that: (a) partial or total structural collapse does not occur, and (b) damage to nonstructural components is non-life-threatening."

Original structural drawings have been made available to us for our evaluation, with the exception of 2 buildings: the Pool Stadium bleachers and the LeBard Stadium west press box. Additionally, drawings for building additions to Building 39 were not available. The evaluation included visual observations performed by 3 teams of 2 persons each on January 12, 13 & 14, 2015. Teams were led by professional engineers licensed in California. Field work was completed using ladders. No invasive measures were taken and no material testing was performed.

The teams were organized as follows:

TEAM 1	Matthew C. Breaks, SE (Leader)
	Troy Quiambao (1 day), Kerry Regan (2 days)
TEAM 2	Rimah Nazzal, PE (Leader)
	Joel Policarpio, EIT
TEAM 3	Teodor Francu, PE (Leader)
	Christian Cattan, PE

A non-structural evaluation is also included in the scope for this investigation. Miscellaneous signs, appendages, etc. may be deficient and pose a falling hazard threat. Not all non-structural components are shown on the drawings or provided with respect to the attachment used to the structure. Furthermore, the Building Code changed significantly since the original design of the buildings, making most of the current attachments likely to be non-compliant.

The evaluation entailed completion of structural and non-structural checklists identified by ASCE31-03 as Tier 1. The requirements for Tier 1 have been verified in order to identify deficiencies and make recommendations on future required actions.

5. REPORT ORGANIZATION

Following the introductory sections of the report, a detailed listing of the observations and findings is organized by individual building.

For each building, a general description of building construction and history is included. Next is a list of building deficiencies and other comments regarding structural and non-structural findings based on the completed ASCE 31-03 checklists. This is followed by pictures for each building, and then the ASCE 31-03 Tier 1 structural and non-structural checklists as completed for each building corresponding to its Building Type.

The report concludes with recommendations and limitations.

6. OBSERVATIONS & FINDINGS

6.1 GENERAL COMMENTS

The following general comments apply to each individual building evaluation contained in this section.

Performance Level - All individual building evaluations are based on a desired performance level of Life Safety as defined by ASCE31-03.

6.2 GEOLOGIC SITE HAZARDS AND FOUNDATIONS

This section applies to the campus site and therefore each individual building evaluation contained in this section. Deficiencies are noted by individual building.

Site Properties

LEVEL OF SEISMICITY: The level of seismicity as defined by ASCE31-03 is high with contributions from four major seismic faults: Newport-Inglewood, Whittier, San Andreas and San Jacinto. Lesser seismic hazard is posed by other faults such as Norwalk, Palos Verdes, Aliso, El Modeno and 4-S Ranch. The largest documented earthquake that has affected Costa Mesa, generated by the aforementioned Newport-Inglewood fault, is the Long Beach earthquake (1933) with a magnitude of 6.3 M (Mercalli Intensity Scale).

SOIL TYPE: Based on review of Geotechnical Investigation report titled “Proposed Interdisciplinary Complex, Phase I & Phase II, Orange Coast College, Costa Mesa, CA” by Geocon Geotechnical Consultants, Inc. and dated July 7, 2008, the top layer of in-situ fill is sandy clay with silty sand alluvium below.

Also based on this geotechnical investigation, there are no known liquefaction areas within the area of study for this report.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

1. OVERTURNING ratio at the following buildings:
    a. Building 2 – Foundations at the curved shear walls noncompliant.
    b. Building 105, West Press Box – inadequate ratio in the E-W direction.

Additional Observations

Pole foundations appear to occur at some canopies consisting of post supports on one edge and connected to the building along the other edge. Support posts in these locations are embedded in piles, which are tied together with grade beams.

Geologic Site Hazards and Foundations Checklist Sheet 1 of 2
OVERALL PROJECT SITE

Geologic Site Hazards

The following statements shall be completed for buildings in levels of high or moderate seismicity.

C	**NC**	**N/A**	LIQUEFACTION: Liquefaction-susceptible, saturated, loose granular soils that could jeopardize the building's seismic performance shall not exist in the foundation soils at depths within 50 feet under the building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.7. 1. 1)
C	**NC**	**N/A**	SLOPE FAILURE: The building site shall be sufficiently remote from potential earthquake-induced slope failures or rockfalls to be unaffected by such failures or shall be capable of accommodating any predicted movements without failure. (Tier 2: Sec. 4. 7.1.2)
C	**NC**	**N/A**	SURFACE FAULT RUPTURE: Surface fault rupture and surface displacement at the building site is not anticipated. (Tier 2: Sec. 4.7. 1.3)

Condition of Foundations

C	**NC**	**N/A**	FOUNDATION PERFORMANCE: There shall be no evidence of excessive foundation movement such as settlement or heave that would affect the integrity or strength of the structure. (Tier 2:Sec. 4.7.2.1)
C	**NC**	**N/A**	DETERIORATION: There shall not be evidence that foundation elements have deteriorated due to corrosion, sulfate attack, material breakdown, or other reasons in a manner that would affect the integrity or strength of the structure. This statement shall apply to buildings in levels of high or moderate seismicity being evaluated to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.7.2.2)

Capacity of Foundations

C	**NC**	**N/A**	POLE FOUNDATIONS: Pole foundations shall have a minimum embedment depth of 4 feet for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4. 7 .3.1)
C	**NC**	**N/A**	OVERTURNING: The ratio of the horizontal dimension of the lateral-force-resisting system at the foundation level to the building height (base/height) shall be greater than *0.6Sa.* (Tier 2:Sec .. 4.7.3.2)

Geologic Site Hazards and Foundations Checklist Sheet 2 of 2

OVERALL PROJECT SITE

C	**NC**	**N/A**	TIES BETWEEN FOUNDATION ELEMENTS: The foundation shall have ties adequate to resist seismic forces where footings, piles, and piers are not restrained by beams, slabs, or soils classified as Class A, B, or C. (Section 3.5.2.3.1, Tier 2: Sec. 4.7.3.3)
C	**NC**	**N/A**	DEEP FOUNDATIONS: Piles and piers shall be capable of transferring the lateral forces between the structure and the soil. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.7.3.4)
C	**NC**	**N/A**	SLOPING SITES: The difference in foundation embedment depth from one side of the building to another shall not exceed one story in height. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.7.3.5)

6.3 BUILDINGS 2 & 4

6.3.1 BUILDING 2 – STAGE AND AUDITORIUM

Building Description

YEAR OF CONSTRUCTION: 1953
YEAR OF ALTERATIONS: 1992 – Theatre Alterations
BUILDING TYPE: C2A

GENERAL BUILDING DESCRIPTION: Based upon the original structural drawings provided to us and dated circa 1953, the structure is one story high. The existing building comprises diagonally sheathed wood diaphragm supported by double angle steel trusses. Exterior walkway canopies which further connect to adjacent buildings are supported by exterior building walls on one side and cantilever columns on the opposite side.

The 9,800 square feet auditorium located at the south-east corner of the campus consists of diagonally sheathed roof supported by double angle steel trusses. The bearing concrete walls extend 36 feet to the underside of the roof with no parapet.

The 140 feet long by 50 feet wide Stage, located on the south side of the Auditorium consists of diagonally sheathed roof supported by double angle steel trusses. The bearing concrete walls include a 42 inch parapet above the roof line creating an overall height of 30 feet.

In 1992, improvements carried out at the Moore Theatre primarily consisted of renovations to interior finishes, alterations for interior partitions and upgrades to the mechanical and electrical service. Additionally at the trusses above the Auditorium, supports for a new curtain were added, and outside, to the north west of the existing stage, a new mechanical enclosure was built.

There is no apparent seismic separation between the Stage and Auditorium Building and the Drama Workshop.

For exterior elevations and typical construction, see pictures Bldg02SA-01 to Bldg02SA-10.

VERTICAL STRUCTURAL SYSTEM: The foundations consist of pile caps and piles connected by reinforced concrete grade beams. The wood framed roof is supported by steel trusses and bearing concrete walls.

LATERAL STRUCTURAL SYSTEM: The lateral force resisting system comprises reinforced concrete shear walls. The roof comprises plywood sheathing over rafters. Some portions of the roof are labeled per the drawing as blocked, while the majority of the roof is labeled as unblocked.

NON-STRUCTURAL SYSTEMS: The ceilings over the auditorium are comprised of plaster and lath supported by cold rolled channels which in turn are hung from the roof wood framing. The stage is open to framing above with the exception of the west end where a mechanical mezzanine is present. The mezzanine is comprised of double tee concrete slab with reinforced concrete beams. The stage is built with wood framing and was not accessible at the time of our site visit.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. <u>STAGE & AUDITORIUM,</u> PROXIMITY OF ADJACENT BUILDINGS: The clear distance between the adjacent buildings is less than 4 percent of the height.
2. <u>STAGE & AUDITORIUM</u>, INADEQUATE REINFORCING STEEL SPACING: The spacing of reinforcing steel in the concrete walls is greater than 18 inches.
3. <u>STAGE & AUDITORIUM,</u> INADEQUATE WALL ANCHORAGE: Wall anchorages of concrete walls to diaphragm do not have the adequate strength to resist the out-of-plane connection force calculated by the ASCE 31-03 Tier 1 Quick Check Procedure.
4. <u>STAGE & AUDITORIUM</u>, NO CROSS-TIES: No continuous cross-ties are present between diaphragm chords.
5. <u>STAGE & AUDITORIUM</u>, UNBLOCKED DIAPHRAGM SPAN: The maximum unblocked plywood diaphragm horizontal span is greater than the 40 feet limit for Life Safety.
6. <u>STAGE,</u> INADEQUATE INTERIOR MEZZANINE BRACING: The interior mezzanine level is not anchored to the lateral force resisting elements of the main structure and does not have independent bracing.
7. <u>STAGE</u>, UPLIFT AT PILE CAPS: Pile caps in 2 locations do not have top reinforcement which is noncompliant.

Non-structural

8. <u>STAGE</u>, TALL NARROW CONTENTS: Various items are unanchored.
9. <u>STAGE</u>, INADEQUATELY ATTACHED EQUIPMENT: Various equipment weighing over 20 pounds is not braced.
10. <u>AUDITORIUM</u>, INADEQUATE FIRE SUPPRESSION BRACING: Fire suppression piping is not braced.

11. STAGE, NO FLEXIBLE COUPLINGS: Flexible couplings are not present at required piping type.
12. AUDITORIUM, INADEQUATE LATH AND PLASTER CEILING SUPPORT: Ceilings consisting of lath and plaster or gypsum board are not attached to resist seismic forces for every 12 square feet of area.
13. AUDITORIUM, NO INDEPENDENT LIGHT FIXTURE SUPPORT: Light fixtures in the suspended grid ceilings are not supported independently of the ceiling suspension system (picture Bldg02SA-03).

Additional Observations

There is no parapet or horizontal lifeline fall protection system at the Auditorium roof, which may pose a safety hazard.

The trusses are loaded in between panel points directly on the bottom chord by stanchions supporting a curtain on the east and west sides of the Auditorium (picture Bldg02SA-06). This is a non-desirable loading configuration which may destabilize the truss and impose loads on the bottom chord for which it is not designed.

Lights have been added in the plaster-lath ceiling over the Auditorium and in these locations the ceiling support channel is cut with no additional supports added to the roof. This may affect the ceiling's ability to span between supports (picture Bldg02SA-09).

Basic Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 - AUDITORIUM Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 - AUDITORIUM Sheet 2 of 3

C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)
C	NC	N/A	DETERIORATION OF CONCRETE: There shall be no visible deterioration of concrete or reinforcing steel in any of the vertical- or lateral-force-resisting elements. (Tier 2: Sec. 4.3.3.4)
C	NC	N/A	POST-TENSIONING ANCHORS: There shall be no evidence of corrosion or spalling in the vicinity of post-tensioning or end fittings. Coil anchors shall not have been used. (Tier 2: Sec. 4.3.3.5)
C	NC	N/A	CONCRETE WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 1 /8 inch for Life Safety and 1/1 6 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.9)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the concrete shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the greater of 100 psi or 2*sqrt(f’c) for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.1)
C	NC	N/A	REINFORCING STEEL: The ratio of reinforcing steel area to gross concrete area shall be not less than 0.0015 in the vertical direction and 0.0025 in the horizontal direction for Life Safety and Immediate Occupancy. The spacing of reinforcing steel shall be equal to or less than 18 inches for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.2)

Basic Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms

BUILDING 2 - AUDITORIUM Sheet 3 of 3

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3.7. (Tier 2: Sec. 4.6.1.1)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2 Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)

Supplemental Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 – AUDITORIUM Sheet 1 of 3

Lateral-Force-Resisting System

C	NC	N/A	COUPLING BEAMS: The stirrups in coupling beams over means of egress shall be spaced at or less than d/2 and shall be anchored into the confined core of the beam with hooks of 135° or more for Life Safety. All coupling beams shall comply with the requirements above and shall have the capacity in shear to develop the uplift capacity of the adjacent wall for Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.3)
C	NC	N/A	OVERTURNING: All shear walls shall have aspect ratios less than 4-to-1. Wall piers need not be considered. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.4)
C	NC	N/A	CONFINEMENT REINFORCING: For shear walls with aspect ratios greater than 2-to-1, the boundary elements shall be confined with spirals or ties with spacing less than 8d1t- This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.5)
C	NC	N/A	REINFORCING AT OPENINGS: There shall be added trim reinforcement around all wall openings with a dimension greater than three times the thickness of the wall. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.6)
C	NC	N/A	WALL THICKNESS: Thickness of bearing walls shall not be less than 1/25 the unsupported height or length, whichever is shorter, nor less than 4 inches. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.7)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)

Supplemental Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 – AUDITORIUM Sheet 2 of 3

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5. I .4)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)

Supplemental Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 – AUDITORIUM Sheet 3 of 3

C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-1. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3. I)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

Basic Nonstructural Component Checklist Sheet 1 of 4
BUILDING 2 - AUDITORIUM

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist
BUILDING 2 - AUDITORIUM

Sheet 2 of 4

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	NA	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist Sheet 3 of 4
BUILDING 2 – AUDITORIUM

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 2 – AUDITORIUM

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 2 - AUDITORIUM

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 2 – AUDITORIUM

C	NC	N/A	
C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

Basic Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 – STAGE Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 - STAGE Sheet 2 of 3

C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)
C	NC	N/A	DETERIORATION OF CONCRETE: There shall be no visible deterioration of concrete or reinforcing steel in any of the vertical- or lateral-force-resisting elements. (Tier 2: Sec. 4.3.3.4)
C	NC	N/A	POST-TENSIONING ANCHORS: There shall be no evidence of corrosion or spalling in the vicinity of post-tensioning or end fittings. Coil anchors shall not have been used. (Tier 2: Sec. 4.3.3.5)
C	NC	N/A	CONCRETE WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 1 /8 inch for Life Safety and 1/1 6 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.9)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the concrete shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the greater of 100 psi or 2*sqrt(f'c) for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.1)
C	NC	N/A	REINFORCING STEEL: The ratio of reinforcing steel area to gross concrete area shall be not less than 0.0015 in the vertical direction and 0.0025 in the horizontal direction for Life Safety and Immediate Occupancy. The spacing of reinforcing steel shall be equal to or less than 18 inches for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.2)

Basic Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 - STAGE Sheet 3 of 3

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on 1he diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3.7. (Tier 2: Sec. 4.6.1.1)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2 Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)

Supplemental Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 – STAGE Sheet 1 of 3

Lateral-Force-Resisting System

C	NC	N/A	COUPLING BEAMS: The stirrups in coupling beams over means of egress shall be spaced at or less than d/2 and shall be anchored into the confined core of the beam with hooks of 135° or more for Life Safety. All coupling beams shall comply with the requirements above and shall have the capacity in shear to develop the uplift capacity of the adjacent wall for Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.3)
C	NC	N/A	OVERTURNING: All shear walls shall have aspect ratios less than 4-to-1. Wall piers need not be considered. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.4)
C	NC	N/A	CONFINEMENT REINFORCING: For shear walls with aspect ratios greater than 2-to-1, the boundary elements shall be confined with spirals or ties with spacing less than 8d1t- This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.5)
C	NC	N/A	REINFORCING AT OPENINGS: There shall be added trim reinforcement around all wall openings with a dimension greater than three times the thickness of the wall. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.6)
C	NC	N/A	WALL THICKNESS: Thickness of bearing walls shall not be less than 1/25 the unsupported height or length, whichever is shorter, nor less than 4 inches. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.7)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)

Supplemental Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 – STAGE Sheet 2 of 3

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5. I .4)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)

Supplemental Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 – STAGE Sheet 3 of 3

C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-1. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3. I)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

Basic Nonstructural Component Checklist Sheet 1 of 4
BUILDING 2 - STAGE

Partitions

C	**NC**	**N/A**	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	**NC**	**N/A**	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	**NC**	**N/A**	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	**NC**	**N/A**	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	**NC**	**N/A**	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	**NC**	**N/A**	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 2 - STAGE

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	NA	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist Sheet 3 of 4
BUILDING 2 – STAGE

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 2 – STAGE

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 2 - STAGE

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 2 – STAGE

C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.3.2 BUILDING 2 –DRAMA WORKSHOP

Building Description

YEAR OF CONSTRUCTION: 1974
YEAR OF ALTERATIONS: N/A
BUILDING TYPE: C2A

GENERAL BUILDING DESCRIPTION: Based upon the original structural drawings provided to us and dated circa 1974, the structure is one story high. The existing building comprises insulating concrete over a metal deck diaphragm supported by steel framing. At the perimeter, 12 inch thick concrete walls extend all the way up to the roof. Exterior walkway canopies which connect adjacent buildings are supported by exterior building walls on one side and cantilever columns on the opposite side.

There is no apparent seismic separation between the Stage and Auditorium building and the Drama Workshop.

For exterior elevations and typical construction, see pictures Bldg02DW-01 to Bldg02DW-07.

VERTICAL STRUCTURAL SYSTEM: Most of the building is constructed of 12 inch thick reinforced concrete walls which are 24 feet high. The foundations consist of pile caps and piles connected by reinforced concrete grade beams.

LATERAL STRUCTURAL SYSTEM: The lateral force resisting system comprises reinforced concrete shear walls. The roof comprises metal decking over steel beams

NON-STRUCTURAL SYSTEMS: There is a pipe grid supporting lighting and curtains at the Drama Workshop. It is attached with beam clamps to the steel framing. Cable bracing provides lateral restraint for the pipe grid. At the west side of the Drama Workshop, there is a mezzanine with office space. Integrated ceiling system was observed in the office space.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. PROXIMITY OF ADJACENT BUILDINGS: The clear distance between the adjacent buildings is less than 4 percent of the height.

2. INADEQUATE INTERIOR MEZZANINE BRACING: The interior mezzanine level is not anchored to the lateral force resisting elements of the main structure and does not have independent bracing.
3. INADEQUATE REINFORCING STEEL SPACING: The spacing of reinforcing steel in the concrete walls is greater than 18 inches.
4. INADEQUATE WALL ANCHORAGE: Wall anchorages of concrete walls to diaphragm do not have the adequate strength to resist the out-of-plane connection force calculated by the ASCE 31-03 Tier 1 Quick Check Procedure.

Non-structural

5. APPENDAGES: The sign over the Drama Workshop, at the Theatre entrance, appears to be inadequately braced (Bldg02DW-08 to Bldg02DW-09).
6. TALL NARROW CONTENTS: Various items are not laterally braced.
7. INADEQUATE FIRE SUPPRESSION PIPING: Fire suppression piping is not braced properly, and flexible couplings are not provided.

Basic Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 – DRAMA WORKSHOP Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 - DRAMA WORKSHOP Sheet 2 of 3

C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)
C	NC	N/A	DETERIORATION OF CONCRETE: There shall be no visible deterioration of concrete or reinforcing steel in any of the vertical- or lateral-force-resisting elements. (Tier 2: Sec. 4.3.3.4)
C	NC	N/A	POST-TENSIONING ANCHORS: There shall be no evidence of corrosion or spalling in the vicinity of post-tensioning or end fittings. Coil anchors shall not have been used. (Tier 2: Sec. 4.3.3.5)
C	NC	N/A	CONCRETE WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 1 /8 inch for Life Safety and 1/1 6 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.9)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the concrete shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the greater of 100 psi or 2*sqrt(f'c) for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.1)
C	NC	N/A	REINFORCING STEEL: The ratio of reinforcing steel area to gross concrete area shall be not less than 0.0015 in the vertical direction and 0.0025 in the horizontal direction for Life Safety and Immediate Occupancy. The spacing of reinforcing steel shall be equal to or less than 18 inches for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.2)

Basic Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 - DRAMA WORKSHOP Sheet 3 of 3

Connections

C	**NC**	**N/A**	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on 1he diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3.7. (Tier 2: Sec. 4.6.1.1)
C	**NC**	**N/A**	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2 Sec. 4.6.2.1)
C	**NC**	**N/A**	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)

Supplemental Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms

BUILDING 2 – DRAMA WORKSHOP Sheet 1 of 3

Lateral-Force-Resisting System

C	NC	N/A	COUPLING BEAMS: The stirrups in coupling beams over means of egress shall be spaced at or less than d/2 and shall be anchored into the confined core of the beam with hooks of 135° or more for Life Safety. All coupling beams shall comply with the requirements above and shall have the capacity in shear to develop the uplift capacity of the adjacent wall for Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.3)
C	NC	N/A	OVERTURNING: All shear walls shall have aspect ratios less than 4-to-1. Wall piers need not be considered. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.4)
C	NC	N/A	CONFINEMENT REINFORCING: For shear walls with aspect ratios greater than 2-to-1, the boundary elements shall be confined with spirals or ties with spacing less than 8d1t- This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.5)
C	NC	N/A	REINFORCING AT OPENINGS: There shall be added trim reinforcement around all wall openings with a dimension greater than three times the thickness of the wall. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.6)
C	NC	N/A	WALL THICKNESS: Thickness of bearing walls shall not be less than 1/25 the unsupported height or length, whichever is shorter, nor less than 4 inches. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.7)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)

Supplemental Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms

BUILDING 2 – DRAMA WORKSHOP Sheet 2 of 3

C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5. I .4)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-1. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3. I)

Supplemental Structural Checklist for Building Type C2A: Concrete Shear Walls with Flexible Diaphragms
BUILDING 2 – DRAMA WORKSHOP Sheet 3 of 3

C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

Basic Nonstructural Component Checklist Sheet 1 of 4
BUILDING 2 – DRAMA WORKSHOP

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 2 – DRAMA WORKSHOP

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	NA	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist
BUILDING 2 – DRAMA WORKSHOP

Sheet 3 of 4

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist
BUILDING 2 – DRAMA WORKSHOP

Sheet 4 of 4

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 2 – DRAMA WORKSHOP

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 2 – DRAMA WORKSHOP

C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.3.3 BUILDING 4 – MUSIC

Building Description

YEAR OF CONSTRUCTION: 1954
YEAR OF ALTERATIONS: 1964 - Addition
BUILDING TYPE: W2, RM1

GENERAL BUILDING DESCRIPTION: Based on the drawings provided and dated circa 1954, the original building comprises wood framed walls combined with reinforced brick walls and a steel framed roof. In 1964, at the south end of the existing structure a building similar in shape and construction type was added to the original construction. Walkway canopies connected to other buildings are directly attached to the building.

For exterior views, see pictures Bldg04-01 to Bldg04-04.

VERTICAL STRUCTURAL SYSTEM: The original building roof framing comprises steel members with wood nailers and diagonal sheathing at the diaphragm level. The roof for the 1964 addition comprises wood framing and structural panels. The wood framed walls extend from the foundation to the roof framing.

LATERAL STRUCTURAL SYSTEM: The main lateral force resisting system of the original structure entails wood framed walls with diagonal sheathing. The 1964 addition was carried out with structural panels at the wood framed walls in lieu of the diagonal sheathing. The diaphragm comprises diagonal sheathing and structural panels for the original structure and addition respectively.

NON-STRUCTURAL SYSTEMS: Integrated ceilings appear to have compression struts and splay wires and the ceiling mounted lights are suspended independently by wires from two opposite diagonal corners.

For non-structural systems and items present within the building, see pictures Bldg04-05 and Bldg04-06.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. INADEQUATE WALL ANCHORAGE: Wall anchorages of masonry walls to diaphragm do not have the adequate strength to resist the out-of-plane connection force calculated by the ASCE 31-03 Tier 1 Quick Check Procedure.
2. PROXIMITY OF ADJACENT BUILDINGS: The clear distance between the adjacent buildings is less than 4 percent of the height; walkway canopies are directly attached, and further connect to buildings.
3. NO CROSS TIES: There are typically no cross ties between diaphragm chords.

Non-structural

4. INADEQUATE INTEGRATED CEILING SUPPORT: Lateral restraint of integrated suspended ceilings at exits and corridors are not compliant.
5. NO INDEPENDENT LIGHT FIXTURE SUPPORT: Light fixtures in the suspended grid ceilings are not supported independently of the ceiling suspension system.

Additional Observations

Within the original structure, at the south wall which connects to the new addition, there is an area with a low roof connecting to a mechanical room. This lower diaphragm contains reentrant corners which include no collectors. While this item is not specifically identified on a checklist for the building, this deficiency should be noted, as that it compromises the building's seismic lateral performance.

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial

BUILDING 4 - Music Sheet 1 of 3

Building System

C	**NC**	**N/A**	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	**NC**	**N/A**	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	**NC**	**N/A**	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	**NC**	**N/A**	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	**NC**	**N/A**	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	**NC**	**N/A**	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	**NC**	**N/A**	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 4 - Music Sheet 2 of 3

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C	NC	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 4 - Music Sheet 3 of 3

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2. 7. 7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive tics capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)
C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 4 - Music Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 4 - Music Sheet 2 of 2

C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end di stance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 4 – MUSIC Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The Structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 8- percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety an Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 4 – MUSIC Sheet 2 of 3

C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next Life safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)
C	NC	N/A	MASONRY UNITS: There shall be no visible deterioration of masonry units. (Tier 2: Sec. 4.3.3.7)
C	NC	N/A	MASONRY JOINTS: The mortar shall not be easily scraped away from the joints by hand with a metal tool, and there shall be no areas of eroded mortar. (Tier 2: Sec. 4.3.3.8)
C	NC	N/A	REINFORCED MASONRY WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 118 inch for Life Safety and 1/16 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.10)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in I.be reinforced masonry shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than 70 psi for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.4.1)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms

BUILDING 4 – MUSIC Sheet 1 of 3

C	NC	N/A	REINFORCING STEEL: The total vertical and horizontal reinforcing steel ratio in reinforced masonry walls shall be greater than 0.002 for Life Safety and Immediate Occupancy of the wall with the minimum of 0.0007 for Life Safety and Immediate Occupancy in either of the two directions; the spacing of reinforcing steel shall be less than 48 inches for Life Safety and Immediate Occupancy; and all vertical bars shall extend to the top of the walls. (Tier 2: Sec. 4.4.2.4.2)

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3. 7. (Tier 2: Sec. 4.6.1.1)
C	NC	N/A	WOOD LEDGERS: The connection between the wall panels and the diaphragm shall not induce cross-grain bending or tension in the wood ledgers. (Tier 2: Sec. 4.6.1.2)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)
C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 4 – MUSIC Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	REINFORCING AT OPENINGS: All wall openings that interrupt rebar shall have trim reinforcing on all sides. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.3)
C	NC	N/A	PROPORTIONS: The height-to-thickness ratio of the shear walls at each story shall be less than 30. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.4)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.4)
C	NC	N/A	OPENINGS AT EXTERIOR MASONRY SHEAR WALLS: Diaphragm openings immediately adjacent to exterior masonry shear walls shall not be greater than 8 feet long for Life Safety and 4 feet long for Immediate Occupancy. (Tier 2: Sec. 4.5.1.6)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 4 – MUSIC Sheet 2 of 2

C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-J for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-1. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5. 7.1)

Connections

C	NC	N/A	STIFFNESS OF WALL ANCHORS: Anchors of concrete or masonry walls to wood structural elements shall be installed taut and shall be stiff enough to limit the relative movement between the wall and the diaphragm to no greater than 1/8 inch prior to engagement of the anchors. (Tier 2:Sec. 4.6.1.4)

Basic Nonstructural Component Checklist
BUILDING 4 – MUSIC

Sheet 1 of 4

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 4 – MUSIC

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	NA	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	N/A	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist Sheet 3 of 4
BUILDING 4 – MUSIC

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 4 – MUSIC

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 4 – MUSIC

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 4 – MUSIC

C	**NC**	**N/A**	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	**NC**	**N/A**	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	**NC**	**N/A**	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	**NC**	**N/A**	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.4 BUILDINGS 7, 8 & 9

6.4.1 BUILDING 7 – STUDENT SUCCESS CENTER

Building Description

YEAR OF CONSTRUCTION:	1950
YEAR OF ALTERATIONS:	1959 - Library Addition
	1999 - Seismic Retrofit
BUILDING TYPE:	W2, RM1, S2A, PC1

GENERAL BUILDING DESCRIPTION: Based upon the structural drawings provided to us and dated circa 1950, the original structure, one story high, comprises wood framed, precast concrete and masonry walls with a wood diaphragm supported by steel framing. In 1999, the building underwent a seismic retrofit with significant improvements to the lateral force resisting system. The foundation system was not observed in the field, but study of the original construction documents indicate foundations consisting of continuous wall footings under walls.

For exterior elevations and typical construction, see pictures Bldg07-01 to Bldg07-10.

VERTICAL STRUCTURAL SYSTEM: The gravity system of the building is comprised of steel framing supported on steel columns, precast concrete walls, or reinforced masonry walls which in turn are supported by the continuous concrete footing.

LATERAL STRUCTURAL SYSTEM: The lateral force resisting system for the building includes wood shear walls, masonry shear walls, precast concrete shear walls and steel braced frames along with cantilevered columns. The base fixity of the cantilevered columns in the in-plane direction is achieved by casting them into a masonry stem wall, approximately 3'-4". New shear walls have been added during the 1999 retrofit along with collectors to transfer loads from the diaphragm into the various resisting elements. Plywood sheathing has also been added over the diagonal sheathing at the roof level.

NON-STRUCTURAL SYSTEMS: The integrated ceiling system appears to be adequately anchored and braced to the parent structure. The ceiling mounted lights are supported individually from two opposite corners. Cabinetry is present throughout the building.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. PROXIMITY OF ADJACENT BUILDINGS: The clear distance between Building 7 and Building 8 is less than 4 percent of the height (picture Bldg08-01).
2. INADEQUATE PRECAST PANEL CONNECTIONS: Less than 2 anchors from each precast wall panel into the diaphragm are present.
3. INADEQUATE STEEL BRACED FRAMES: The axial stress in the diagonals exceeds the 0.50Fy limit for Life Safety, and members do not meet compact section requirements.
4. PRECAST WALL PANELS AT FOUNDATION: Wall panels are not connected to the foundation along the panel lengths.

Non-structural

5. TALL NARROW CONTENTS: Cabinets throughout the building are typically unanchored.
6. DETERIORATION IN MECHANICAL ANCHORAGE: Deterioration is typical at wood support framing at units (picture Bldg07-11).
7. INADEQUATE FIRE SUPPRESSION PIPING: Fire suppression piping is not anchored and braced properly, and flexible couplings are not provided.

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The Structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 8- percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety an Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 2 of 3

C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next Life safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)
C	NC	N/A	MASONRY UNITS: There shall be no visible deterioration of masonry units. (Tier 2: Sec. 4.3.3.7)
C	NC	N/A	MASONRY JOINTS: The mortar shall not be easily scraped away from the joints by hand with a metal tool, and there shall be no areas of eroded mortar. (Tier 2: Sec. 4.3.3.8)
C	NC	N/A	REINFORCED MASONRY WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 118 inch for Life Safety and 1/16 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.10)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in I.be reinforced masonry shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than 70 psi for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.4.1)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 3 of 3

C	NC	N/A	REINFORCING STEEL: The total vertical and horizontal reinforcing steel ratio in reinforced masonry walls shall be greater than 0.002 for Life Safety and Immediate Occupancy of the wall with the minimum of 0.0007 for Life Safety and Immediate Occupancy in either of the two directions; the spacing of reinforcing steel shall be less than 48 inches for Life Safety and Immediate Occupancy; and all vertical bars shall extend to the top of the walls. (Tier 2: Sec. 4.4.2.4.2)

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3. 7. (Tier 2: Sec. 4.6.1.1)
C	NC	N/A	WOOD LEDGERS: The connection between the wall panels and the diaphragm shall not induce cross-grain bending or tension in the wood ledgers. (Tier 2: Sec. 4.6.1.2)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)
C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	REINFORCING AT OPENINGS: All wall openings that interrupt rebar shall have trim reinforcing on all sides. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.3)
C	NC	N/A	PROPORTIONS: The height-to-thickness ratio of the shear walls at each story shall be less than 30. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.4)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.4)
C	NC	N/A	OPENINGS AT EXTERIOR MASONRY SHEAR WALLS: Diaphragm openings immediately adjacent to exterior masonry shear walls shall not be greater than 8 feet long for Life Safety and 4 feet long for Immediate Occupancy. (Tier 2: Sec. 4.5.1.6)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	NA	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 2 of 2

C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-J for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-1. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5. 7.1)

Connections

C	NC	N/A	STIFFNESS OF WALL ANCHORS: Anchors of concrete or masonry walls to wood structural elements shall be installed taut and shall be stiff enough to limit the relative movement between the wall and the diaphragm to no greater than 1/8 inch prior to engagement of the anchors. (Tier 2:Sec. 4.6.1.4)

Basic Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1 . 1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and immediate Occupancy. (Tier 2: Sec. 4.3. 1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1I)

Basic Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 2 of 3

C	NC	N/A	PRECAST CONCRETE WALLS: There shall be no visible deterioration of concrete or reinforcing steel or evidence of distress, especially at the connections. (Tier 2: Sec. 4.3.3.6)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the precast panels, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the greater of 10 psi or $2(f'c)^{0.5}$ for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.3.1)
C	NC	N/A	REINFORCING STEEL: The ratio of reinforcing steel area to gross concrete area shall be not less than 0.0015 in the vertical direction and 0.0025 in the horizontal direction for Life Safety and Immediate Occupancy. The spacing of reinforcing steel shall be equal 10 or less than 18 inches for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.3.2)

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3. 7. (Tier 2: Sec. 4.6. 1.1)
C	NC	N/A	WOOD LEDGERS: The connection between the wall panels and the diaphragm shall not induce cross-grain bending or tension in the wood ledgers. (Tier 2: Sec. 4.6. 1 .2)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)

Basic Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 3 of 3

C	**NC**	**N/A**	PRECAST WALL PANELS: Precast wall panels shall be connected to the foundation for Life Safety and the connections shall be able to develop the strength of the walls for Immediate Occupancy. (Tier2: Sec. 4.6.3.7)
C	**NC**	**N/A**	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	COUPLING BEAMS: The stirrups in coupling beams over means of egress shall be spaced at or less than d/2 and shall be anchored into the confined core of the beam with hooks of 135° or more for Life Safety. All coupling beams shall comply with the requirements above and shall have the capacity in shear to develop the uplift capacity of the adjacent wall for Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.3)
C	NC	N/A	WALL OPENINGS: The total width of openings along any perimeter wall line shall constitute less than 75 percent of the length of any perimeter wall for Life Safety and 50 percent for Immediate Occupancy with the wall piers having aspect ratios of less than 2-to- l for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.3.3)
C	NC	N/A	CORNER OPENINGS: Walls with openings al a building comer larger than the width of a typical panel shall be connected to the remainder of the wall with collector reinforcing. (Tier 2: Sec. 4.4.2.3.4)
C	NC	N/A	PANEL-TO-PANEL CONNECTIONS: Adjacent wall panels shall be interconnected to transfer overturning forces between panels by methods other than welded steel inserts. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.3.5)
C	NC	N/A	WALL THICKNESS: Thickness of bearing walls shall not be less than 1125 the unsupported height or length, whichever is shorter, nor less than 4 inches. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.3.6)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant corners or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)

Supplemental Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 2 of 2

C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5. 1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-l for Life Safety and 3-to-l for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7. 1)

Connections

C	NC	N/A	PRECAST PANEL CONNECTIONS: There shall be at least two anchors from each precast wall panel into the diaphragm elements for Life Safety and the anchors shall be able to develop the strength of the panels for Immediate Occupancy. (Tier 2: Sec. 4.6.1.3)
C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3. 10)
C	NC	N/A	GIRDERS: Girders supported by walls or pilasters shall have at least two ties securing the anchor bolts for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.6.4.2)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 1 of 4

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 2 of 4

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C	NC	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 3 of 4

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2. 7. 7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive tics capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 4 of 4

C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 2 of 2

C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end di stance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

Basic Structural Checklist for Building Type S2A: Steel Braced Frames with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1 .2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)

Basic Structural Checklist for Building Type S2A: Steel Braced Frames with Flexible Diaphragms

BUILDING 7 – STUDENT SUCCESS CENTER Sheet 2 of 3

C	NC	N/A	DETERIORATION OF STEEL: There shall be no visible rusting, corrosion, cracking, or other deterioration in any of the steel elements or connections in the vertical- or lateral-force-resisting systems. (Tier 2: Sec. 4.3.3.3)

Lateral-Force-Resisting System

C	NC	N/A	AXIAL STRESS CHECK: The axial stress due to gravity loads in columns subjected to overturning forces shall be less than $0.10F_y$ for Life Safety and Immediate Occupancy. Alternatively, the axial stress due to overturning forces alone, calculated using the Quick Check procedure of Section 3.5.3.6, shall be less than $0.30F_y$ for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.2)
C	NC	N/A	REDUNDANCY: The number of lines of braced frames in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. The number of braced bays in each line shall be greater than 2 for Life Safety and 3 for Immediate Occupancy. (Tier 2: Sec. 4.4.3.1.1)
C	NC	N/A	AXIAL STRESS CHECK: The axial stress in the diagonals, calculated using the Quick Check procedure of Section 3.5.3.4, shall be less than $0.50F_y$ for Life Safety and for Immediate Occupancy. (Tier 2: Sec. 4.4.3.1 .2)
C	NC	N/A	COLUMN SPLICES: All column splice details located in braced frames shall develop the tensile strength of the column. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.3.1.3)

Connections

C	NC	N/A	TRANSFER TO STEEL FRAMES: Diaphragms shall be connected for transfer of loads to the steel frames for Life Safety, and the connections shall be able to develop the lesser of the strength of the frames or the diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.2)

Basic Structural Checklist for Building Type S2A: Steel Braced Frames with Flexible Diaphragms
BUILDING 7 – CLASSROOMS & LABS Sheet 3 of 3

C	NC	N/A	STEEL COLUMNS: The columns in lateral-force-resisting frames shall be anchored to the building foundation for Life Safety, and the anchorage shall be able to develop the lesser of the tensile capacity of the column, the tensile capacity of the lowest level column splice (if any), or the uplift capacity of the foundation, for Immediate Occupancy. (Tier 2: Sec. 4.6.3.1)

Supplemental Structural Checklist for Building Type S2A: Steel Braced Frames with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	COMPACT MEMBERS: All frame elements shall meet section requirements set forth by Seismic Provisions for Structural Steel Buildings Table 1-9-1 (AISC, 1997). (Tier 2: Sec. 4.4. 1.3.7)
C	NC	N/A	SLENDERNESS OF DIAGONALS: All diagonal elements required to carry compression shall have Kl/r ratios less than 120. (Tier 2: Sec. 4.4.3.1.4)
C	NC	N/A	CONNECTION STRENGTH: All the brace connections shall develop the yield capacity of the diagonals. (Tier 2: Sec. 4.4.3.1 .5)
C	NC	N/A	OUT-OF-PLANE BRACING: Braced frame connections attached to beam bottom flanges located away from beam-column joints shall be braced out-of-plane at the bottom flange of the beams. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2:Sec. 4.4.3.1.6)
C	NC	N/A	K-BRACING: The bracing system shall not include K-braced bays. (Tier 2: Sec. 4.4.3.2.1)
C	NC	N/A	TENSION-ONLY BRACES: Tension-only braces shall not comprise more than 70 percent of the total lateral-force-resisting capacity in structures over two stories in height. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.3.2.2)
C	NC	N/A	CHEVRON BRACING: The bracing system shall not include chevron, or V-braced, bays. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.3.2.3)
C	NC	N/A	CONCENTRICALLY BRACED FRAME JOINTS: All the diagonal braces shall frame into the beam-column joints concentrically. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.3.2.4)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT BRACED FRAMES: Diaphragm openings immediately adjacent to the braced frames shall extend less than 25 percent of the frame length for Life Safety and 15 percent of the frame length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.5)

Supplemental Structural Checklist for Building Type S2A: Steel Braced Frames with Flexible Diaphragms
BUILDING 7 – STUDENT SUCCESS CENTER Sheet 2 of 2

C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1 .8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-l for Life Safety and 3-to-l for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-I. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)

Connections

C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

Basic Nonstructural Component Checklist
BUILDING 7 – STUDENT SUCCESS CENTER

Sheet 1 of 4

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 7 – STUDENT SUCCESS CENTER

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	N/A	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist
BUILDING 7 – STUDENT SUCCESS CENTER

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 7 – STUDENT SUCCESS CENTER

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 7 – STUDENT SUCCESS CENTER

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 7 – STUDENT SUCCESS CENTER

C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.4.2 BUILDING 8 – CLASSROOMS & LABS

Building Description

YEAR OF CONSTRUCTION: 1950
YEAR OF ALTERATIONS: 1954 - Building 8 Addition
1986 - Mechanical Improvements
BUILDING TYPE: PC1, RM1, S1A, S2A

GENERAL BUILDING DESCRIPTION: Based upon the structural drawings provided and dated circa 1950, the original portion of the structure was built at the same time as Building 7. This area is comprised of restrooms and office space. The one story building has masonry walls and precast concrete walls with a wood diaphragm. In 1954 additions were made and at the same time Building 9 was constructed. The newly added construction matches the existing with masonry walls, precast concrete walls and wood diaphragm. As part of the Building 7 Seismic Retrofit in 1999, mechanical units were added on the roof of the covered walkway running along the west side of Building 8.

For exterior elevations and other exterior views, see pictures Bldg08-01 to Bldg08-06.

VERTICAL STRUCTURAL SYSTEM: The gravity system of the building comprises steel framing supported on steel columns, precast concrete walls or reinforced masonry walls which in turn are supported by the continuous concrete grade beam and piles.

LATERAL STRUCTURAL SYSTEM: The lateral force resisting system for the building includes masonry shear walls, precast concrete shear walls, steel moment frames, and steel braced frames. The diaphragms are sheathed with diagonal 1x lumber.

NON-STRUCTURAL SYSTEMS: The integrated ceiling system appears to be adequately anchored and braced to the parent structure. The ceiling mounted lights are supported individually from two opposite corners. Cabinetry is present throughout the building.

For non-structural systems and items present within the building, see pictures Bldg08-07 to Bldg08-09.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. PROXIMITY OF ADJACENT BUILDINGS: The clear distance between Building 7 and Building 8 is less than 4 percent of the height (picture Bldg08-01). Additionally, the walkway canopy is directly attached to Building 8 and also connects to Building 9.
2. REDUNDANCY: The number of steel braced frame bays in each line is not greater than 2.
3. INADEQUATE WALL ANCHORAGE: The wall anchorage of precast concrete wall panels to the diaphragm does not have the adequate strength to resist the out-of-plane connection force calculated by the ASCE 31-03 Tier 1 Quick Check Procedure.
4. CROSS-GRAIN BENDING IN WOOD LEDGERS: Ledger connection between precast wall panels and the diaphragm induces cross-grain bending.
5. PRECAST WALL PANELS AT FOUNDATION: Wall panels are not adequately connected to the foundation
6. NO CROSS TIES: There are typically no cross ties between diaphragm chords.
7. INADEQUATE STEEL BRACED FRAMES: The axial stress in the diagonals exceeds the 0.50Fy limit for Life Safety, and members do not meet compact section requirements.
8. DETERIORATION OF WOOD: The walkway canopy wood framing supporting mechanical equipment shows signs of moderate deterioration and in-grain splitting (picture Bldg08-05).
9. INTERFERING WALLS AT MOMENT FRAMES: Infill walls in moment frames are not isolated properly.
10. UNACCEPTABLE DRIFT AT MOMENT FRAMES: The drift ratio is greater than the limit of 0.025 for Life Safety.

Non-structural

11. TALL NARROW CONTENTS: Cabinets throughout the building are typically unanchored.
12. DETERIORATION IN MECHANICAL ANCHORAGE: Deterioration is typical at wood support framing at units.
13. INADEQUATE FIRE SUPPRESSION PIPING: Fire suppression piping is not anchored and braced properly, and flexible couplings are not provided.

Basic Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1 . 1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and immediate Occupancy. (Tier 2: Sec. 4.3. 1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1I)

Basic Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 2 of 3

C	NC	N/A	PRECAST CONCRETE WALLS: There shall be no visible deterioration of concrete or reinforcing steel or evidence of distress, especially at the connections. (Tier 2: Sec. 4.3.3.6)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the precast panels, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the greater of 10 psi or $2(f'c)^{0.5}$ for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.3.1)
C	NC	N/A	REINFORCING STEEL: The ratio of reinforcing steel area to gross concrete area shall be not less than 0.0015 in the vertical direction and 0.0025 in the horizontal direction for Life Safety and Immediate Occupancy. The spacing of reinforcing steel shall be equal 10 or less than 18 inches for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.3.2)

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls 1hat are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3. 7. (Tier 2: Sec. 4.6. 1.1)
C	NC	N/A	WOOD LEDGERS: The connection between the wall panels and the diaphragm shall not induce cross-grain bending or tension in the wood ledgers. (Tier 2: Sec. 4.6. 1 .2)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)

Basic Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 3 of 3

C	NC	N/A	PRECAST WALL PANELS: Precast wall panels shall be connected to the foundation for Life Safety and the connections shall be able to develop the strength of the walls for Immediate Occupancy. (Tier2: Sec. 4.6.3.7)
C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	COUPLING BEAMS: The stirrups in coupling beams over means of egress shall be spaced at or less than d/2 and shall be anchored into the confined core of the beam with hooks of 135° or more for Life Safety. All coupling beams shall comply with the requirements above and shall have the capacity in shear to develop the uplift capacity of the adjacent wall for Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.3)
C	NC	N/A	WALL OPENINGS: The total width of openings along any perimeter wall line shall constitute less than 75 percent of the length of any perimeter wall for Life Safety and 50 percent for Immediate Occupancy with the wall piers having aspect ratios of less than 2-to- l for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.3.3)
C	NC	N/A	CORNER OPENINGS: Walls with openings al a building comer larger than the width of a typical panel shall be connected to the remainder of the wall with collector reinforcing. (Tier 2: Sec. 4.4.2.3.4)
C	NC	N/A	PANEL-TO-PANEL CONNECTIONS: Adjacent wall panels shall be interconnected to transfer overturning forces between panels by methods other than welded steel inserts. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.3.5)
C	NC	N/A	WALL THICKNESS: Thickness of bearing walls shall not be less than 1125 the unsupported height or length, whichever is shorter, nor less than 4 inches. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.3.6)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant corners or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)

Supplemental Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 2 of 2

C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5. 1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-l for Life Safety and 3-to-l for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7. 1)

Connections

C	NC	N/A	PRECAST PANEL CONNECTIONS: There shall be at least two anchors from each precast wall panel into the diaphragm elements for Life Safety and the anchors shall be able to develop the strength of the panels for Immediate Occupancy. (Tier 2: Sec. 4.6.1.3)
C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3. 10)
C	NC	N/A	GIRDERS: Girders supported by walls or pilasters shall have at least two ties securing the anchor bolts for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.6.4.2)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 1 of 3

Building System

C	**NC**	**N/A**	LOAD PATH: The Structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	**NC**	**N/A**	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	**NC**	**N/A**	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	**NC**	**N/A**	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	**NC**	**N/A**	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 8- percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety an Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	**NC**	**N/A**	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	**NC**	**N/A**	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 2 of 3

C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next Life safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)
C	NC	N/A	MASONRY UNITS: There shall be no visible deterioration of masonry units. (Tier 2: Sec. 4.3.3.7)
C	NC	N/A	MASONRY JOINTS: The mortar shall not be easily scraped away from the joints by hand with a metal tool, and there shall be no areas of eroded mortar. (Tier 2: Sec. 4.3.3.8)
C	NC	N/A	REINFORCED MASONRY WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 118 inch for Life Safety and 1/16 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.10)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in I.be reinforced masonry shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than 70 psi for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.4.1)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 3 of 3

C	NC	N/A	REINFORCING STEEL: The total vertical and horizontal reinforcing steel ratio in reinforced masonry walls shall be greater than 0.002 for Life Safety and Immediate Occupancy of the wall with the minimum of 0.0007 for Life Safety and Immediate Occupancy in either of the two directions; the spacing of reinforcing steel shall be less than 48 inches for Life Safety and Immediate Occupancy; and all vertical bars shall extend to the top of the walls. (Tier 2: Sec. 4.4.2.4.2)

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3. 7. (Tier 2: Sec. 4.6.1.1)
C	NC	N/A	WOOD LEDGERS: The connection between the wall panels and the diaphragm shall not induce cross-grain bending or tension in the wood ledgers. (Tier 2: Sec. 4.6.1.2)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)
C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	REINFORCING AT OPENINGS: All wall openings that interrupt rebar shall have trim reinforcing on all sides. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.3)
C	NC	N/A	PROPORTIONS: The height-to-thickness ratio of the shear walls at each story shall be less than 30. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.4)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.4)
C	NC	N/A	OPENINGS AT EXTERIOR MASONRY SHEAR WALLS: Diaphragm openings immediately adjacent to exterior masonry shear walls shall not be greater than 8 feet long for Life Safety and 4 feet long for Immediate Occupancy. (Tier 2: Sec. 4.5.1.6)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	NA	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 2 of 2

C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-J for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-1. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5. 7.1)

Connections

C	NC	N/A	STIFFNESS OF WALL ANCHORS: Anchors of concrete or masonry walls to wood structural elements shall be installed taut and shall be stiff enough to limit the relative movement between the wall and the diaphragm to no greater than 1/8 inch prior to engagement of the anchors. (Tier 2:Sec. 4.6.1.4)

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms

BUILDING 8 – CLASSROOMS & LABS Sheet 1 of 3

Building System

C	**NC**	**N/A**	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	**NC**	**N/A**	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1 .2)
C	**NC**	**N/A**	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	**NC**	**N/A**	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier2: Sec. 4.3.2.1)
C	**NC**	**N/A**	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	**NC**	**N/A**	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	**NC**	**N/A**	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	**NC**	**N/A**	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	**NC**	**N/A**	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 2 of 3

C	NC	N/A	DETERIORATION OF STEEL: There shall be no visible rusting, corrosion, cracking, or other deterioration in any of the steel elements or connections in the vertical- or lateral-force-resisting systems. (Tier 2: Sec. 4.3.3.3)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of moment frames in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. The number of bays of moment frames in each line shall be greater than or equal 10 2 for Life Safety and 3 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.1.1)
C	NC	N/A	INTERFERING WALLS: All concrete and masonry infill walls placed in moment frames shall be isolated from structural elements. (Tier 2: Sec. 4.4.1.2.1)
C	NC	N/A	DRIFT CHECK: The drift ratio of the steel moment frames, calculated using the Quick Check procedure of Section 3.5.3.1, shall be less than 0.025 for Life Safety and 0.015 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.1)
C	NC	N/A	AXIAL STRESS CHECK: The axial stress due to gravity loads in columns subjected to overturning forces shall be less than $0.10F_y$ for Life Safety and Immediate Occupancy. Alternatively, the axial stress due to overturning forces alone, calculated using the Quick Check procedure of Section 3.5.3.6, shall be less than $0.30F_y$ for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.2)

Connections

C	NC	N/A	TRANSFER TO STEEL FRAMES: Diaphragms shall be connected for transfer of loads to the steel frames for Life Safety, and the connections shall be able to develop the lesser of the strength of the frames or the diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.2)

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 3 of 3

C	NC	N/A	STEEL COLUMNS: The columns in lateral-force-resisting frames shall be anchored to the building foundation for Life Safety, and the anchorage shall be able to develop the lesser of the tensile capacity of the column, the tensile capacity of the lowest level column splice (if any), or the uplift capacity of the foundation, for Immediate Occupancy. (Tier 2: Sec. 4.6.3.1)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 1 of 3

Lateral-Force-Resisting System

C	NC	N/A	MOMENT-RESISTING CONNECTIONS: All moment connections shall be able to develop the strength of the adjoining members or panel zones. (Tier 2: Sec. 4.4.1.3.3)
C	NC	N/A	PANEL ZONES: All panel zones shall have the shear capacity to resist the shear demand required to develop 0.8 times the sum of the flexural strengths of the girders framing in at the face of the column. (Tier 2: Sec. 4.4.1.3.4)
C	NC	N/A	COLUMN SPLICES: All column splice details located in moment-resisting frames shall include connection of both flanges and the web for Life Safety,, and the splice shall develop the strength of the column for Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.5)
C	NC	N/A	STRONG COLUMN/WEAK BEAM: The percentage of strong column/weak beam joints in each story of each line of moment-resisting frames shall be greater than *50* percent for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.6)
C	NC	N/A	COMPACT MEMBERS: All frame elements shall meet section requirements set forth by *Seismic Provisions for Structural Steel Buildings* Table I-9-1 (AISC, 1997). (Tier 2: Sec. 4.4.1.3. 7)
C	NC	N/A	BEAM PENETRATIONS: All openings in frame-beam webs shall be less than 1/4 of the beam depth and shall be located in the center half of the beams. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.8)
C	NC	N/A	GIRDER FLANGE CONTINUITY PLATES: There shall be girder flange continuity plates at all moment-resisting frame joints. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.9)
C	NC	N/A	OUT-OF-PLANE BRACING: Beam-column joints shall be braced out-of-plane. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3. I 0)
C	NC	N/A	BOTTOM FLANGE BRACING: The bottom flanges of beams shall be braced out-of-plane. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.11)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms

BUILDING 8 – CLASSROOMS & LABS Sheet 2 of 3

Diaphragms

C	**NC**	**N/A**	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	**NC**	**N/A**	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant corners or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	**NC**	**N/A**	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	**NC**	**N/A**	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	**NC**	**N/A**	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	**NC**	**N/A**	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-l for Life Safety and 3-to-l for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	**NC**	**N/A**	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-I. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	**NC**	**N/A**	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7. 1)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 3 of 3

Connections

C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

Basic Structural Checklist for Building Type S2A: Steel Braced Frames with Flexible Diaphragms

BUILDING 8 – CLASSROOMS & LABS Sheet 1 of 3

Building System

C	**NC**	**N/A**	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	**NC**	**N/A**	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1 .2)
C	**NC**	**N/A**	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	**NC**	**N/A**	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier2: Sec. 4.3.2.1)
C	**NC**	**N/A**	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	**NC**	**N/A**	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	**NC**	**N/A**	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	**NC**	**N/A**	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	**NC**	**N/A**	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)

Basic Structural Checklist for Building Type S2A: Steel Braced Frames with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 2 of 3

C	NC	N/A	DETERIORATION OF STEEL: There shall be no visible rusting, corrosion, cracking, or other deterioration in any of the steel elements or connections in the vertical- or lateral-force-resisting systems. (Tier 2: Sec. 4.3.3.3)

Lateral-Force-Resisting System

C	NC	N/A	AXIAL STRESS CHECK: The axial stress due to gravity loads in columns subjected to overturning forces shall be less than $0.10F_y$ for Life Safety and Immediate Occupancy. Alternatively, the axial stress due to overturning forces alone, calculated using the Quick Check procedure of Section 3.5.3.6, shall be less than $0.30F_y$ for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.2)
C	NC	N/A	REDUNDANCY: The number of lines of braced frames in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. The number of braced bays in each line shall be greater than 2 for Life Safety and 3 for Immediate Occupancy. (Tier 2: Sec. 4.4.3.1.1)
C	NC	N/A	AXIAL STRESS CHECK: The axial stress in the diagonals, calculated using the Quick Check procedure of Section 3.5.3.4, shall be less than $0.50F_y$ for Life Safety and for Immediate Occupancy. (Tier 2: Sec. 4.4.3.1 .2)
C	NC	N/A	COLUMN SPLICES: All column splice details located in braced frames shall develop the tensile strength of the column. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.3.1.3)

Connections

C	NC	N/A	TRANSFER TO STEEL FRAMES: Diaphragms shall be connected for transfer of loads to the steel frames for Life Safety, and the connections shall be able to develop the lesser of the strength of the frames or the diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.2)

Basic Structural Checklist for Building Type S2A: Steel Braced Frames with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 3 of 3

C	NC	N/A	STEEL COLUMNS: The columns in lateral-force-resisting frames shall be anchored to the building foundation for Life Safety, and the anchorage shall be able to develop the lesser of the tensile capacity of the column, the tensile capacity of the lowest level column splice (if any), or the uplift capacity of the foundation, for Immediate Occupancy. (Tier 2: Sec. 4.6.3.1)

Supplemental Structural Checklist for Building Type S2A: Steel Braced Frames with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	COMPACT MEMBERS: All frame elements shall meet section requirements set forth by Seismic Provisions for Structural Steel Buildings Table 1-9-1 (AISC, 1997). (Tier 2: Sec. 4.4. 1.3.7)
C	NC	N/A	SLENDERNESS OF DIAGONALS: All diagonal elements required to carry compression shall have Kl/r ratios less than 120. (Tier 2: Sec. 4.4.3.1.4)
C	NC	N/A	CONNECTION STRENGTH: All the brace connections shall develop the yield capacity of the diagonals. (Tier 2: Sec. 4.4.3.1 .5)
C	NC	N/A	OUT-OF-PLANE BRACING: Braced frame connections attached to beam bottom flanges located away from beam-column joints shall be braced out-of-plane at the bottom flange of the beams. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2:Sec. 4.4.3.1.6)
C	NC	N/A	K-BRACING: The bracing system shall not include K-braced bays. (Tier 2: Sec. 4.4.3.2.1)
C	NC	N/A	TENSION-ONLY BRACES: Tension-only braces shall not comprise more than 70 percent of the total lateral-force-resisting capacity in structures over two stories in height. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.3.2.2)
C	NC	N/A	CHEVRON BRACING: The bracing system shall not include chevron, or V-braced, bays. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.3.2.3)
C	NC	N/A	CONCENTRICALLY BRACED FRAME JOINTS: All the diagonal braces shall frame into the beam-column joints concentrically. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.3.2.4)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT BRACED FRAMES: Diaphragm openings immediately adjacent to the braced frames shall extend less than 25 percent of the frame length for Life Safety and 15 percent of the frame length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.5)

Supplemental Structural Checklist for Building Type S2A: Steel Braced Frames with Flexible Diaphragms
BUILDING 8 – CLASSROOMS & LABS Sheet 2 of 2

C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1 .8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-l for Life Safety and 3-to-l for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-I. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)

Connections

C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

Basic Nonstructural Component Checklist
BUILDING 8 – CLASSROOMS & LABS

Sheet 1 of 4

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4

BUILDING 8 – CLASSROOMS & LABS

C	**NC**	**N/A**	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	**NC**	**N/A**	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	**NC**	**N/A**	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	**NC**	**N/A**	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	**NC**	**N/A**	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	**NC**	**N/A**	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	**NC**	**N/A**	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	**NC**	**N/A**	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist
BUILDING 8 – CLASSROOMS & LABS

Sheet 3 of 4

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist
BUILDING 8 – CLASSROOMS & LABS

Sheet 4 of 4

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 8 – CLASSROOMS & LABS

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 8 – CLASSROOMS & LABS

C	**NC**	**N/A**	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	**NC**	**N/A**	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	**NC**	**N/A**	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	**NC**	**N/A**	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.4.3 BUILDING 9 – CLASSROOMS & LABS

Building Description

YEAR OF CONSTRUCTION: 1955
YEAR OF ALTERATIONS: 1997 – Ceiling and Lighting Seismic Retrofit
BUILDING TYPE: S1A, PC1 (Main Building), RM1 (Storage Building)

GENERAL BUILDING DESCRIPTION: The Classroom Lab main building is a 1 story structure constructed of precast concrete walls, steel columns, and reinforced masonry brick. The structural drawings received are dated 1955. The structure was built at the same time an addition was made to Building 8. It is 140 feet long by 32 feet wide and 15 feet high. There is an additional freestanding ancillary storage structure adjacent to the main building. This building is approximately 43 feet long by 15 feet wide by 8 feet high and is constructed with reinforced masonry. It houses restrooms and a storage area. There is visible deterioration of the brick walls of this building. A walkway canopy is attached between the structures. Additionally there is a damaged beam on the walkway located in close proximity to the buildings. The main structure appears in good condition. Both structures are connected to Building 8 by the walkway canopy.

For exterior elevations and typical construction, see pictures Bldg09-01 to Bldg09-06.

VERTICAL STRUCTURAL SYSTEM: The gravity system of the main building is comprised of wood and steel roof framing supported on steel columns with precast concrete walls. The adjacent ancillary storage structure is comprised of wood roof framing supported on reinforced masonry walls. Both structures are supported by continuous concrete grade beams and piles.

LATERAL STRUCTURAL SYSTEM: The lateral force resisting system for the main building consists of a plywood roof diaphragm with precast concrete shear walls in the transverse direction. In the longitudinal direction, steel moment frames are located along the east exterior wall, and steel cantilevered columns to precast concrete panels are located along the west exterior wall. The steel cantilevered columns are approximately 4 feet in height and transfer the roof diaphragm load to the precast concrete shear walls.

The adjacent ancillary storage structure consists of a plywood roof diaphragm with reinforced masonry shear walls.

NON-STRUCTURAL SYSTEMS: Mechanical equipment is supported on walkway canopies and is not adequately anchored. The projector systems in the main building classrooms are typically not anchored properly.

For non-structural systems and items present within the building, see pictures Bldg09-07 to Bldg09-09.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. MAIN AND STORAGE BUILDINGS, PROXIMITY OF ADJACENT BUILDINGS: The clear distance between the Buildings and walkway canopies does not conform to the minimum limit; walkway canopies are connected to both the Storage and Main Buildings and further connect to Building 8.
1. MAIN BUILDING, INTERFERING WALLS AT MOMENT FRAMES: At south wall, infill walls in moment frames are not isolated properly.
2. MAIN BUILDING, UNACCEPTABLE DRIFT AT MOMENT FRAMES: The drift ratio is greater than the limit of 0.025 for Life Safety.
3. MAIN BUILDING, UNACCEPTABLE STEEL MOMENT FRAMES: Moment-resisting connections, panel zone shear capacities, strong column/weak beam, and compact member criteria are unacceptable and the governing criteria is not sufficiently met.
4. MAIN AND STORAGE BUILDINGS, DETERIORATION OF WOOD: Walkway canopy wood framing supporting mechanical equipment shows signs of overall moderate deterioration, with major deterioration noted in one location (Bldg09-06).
5. STORAGE BUILDING, MASONRY UNITS: Deterioration in masonry units is minor, but visible, in the storage building exterior walls.
6. MAIN BUILDING, NO CROSS TIES: There are typically no cross ties between diaphragm chords.
7. MAIN AND STORAGE BUILDINGS, INADEQUATE WALL ANCHORAGE: Wall anchorage of precast concrete wall panels and reinforced masonry walls to diaphragm do not have the adequate strength to resist the out-of-plane connection force calculated by the ASCE 31-03 Tier 1 Quick Check Procedure.
8. MAIN AND STORAGE BUILDINGS, CROSS-GRAIN BENDING IN WOOD LEDGERS: Ledger connection between precast wall panels and the diaphragm induces cross-grain bending.
9. MAIN BUILDING, PRECAST WALL PANELS AT FOUNDATION: Wall panels are not adequately connected to the foundation.

Non-structural

10. MAIN BUILDING, INADEQUATE EQUIPMENT ATTACHMENT: Screen projectors are not adequately braced in some locations (picture Bldg09-07).
11. MAIN AND STORAGE BUILDINGS, INADEQUATE ANCHORAGE AT MECHANICAL UNITS: Units on building canopies are not anchored adequately (picture Bldg 09-09).

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 9 – MAIN BUILDING, CLASSROOMS & LABS Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1 .2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 9 – MAIN BUILDING, CLASSROOMS & LABS Sheet 2 of 3

C	NC	N/A	DETERIORATION OF STEEL: There shall be no visible rusting, corrosion, cracking, or other deterioration in any of the steel elements or connections in the vertical- or lateral-force-resisting systems. (Tier 2: Sec. 4.3.3.3)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of moment frames in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. The number of bays of moment frames in each line shall be greater than or equal 10 2 for Life Safety and 3 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.1.1)
C	NC	N/A	INTERFERING WALLS: All concrete and masonry infill walls placed in moment frames shall be isolated from structural elements. (Tier 2: Sec. 4.4.1.2.1)
C	NC	N/A	DRIFT CHECK: The drift ratio of the steel moment frames, calculated using the Quick Check procedure of Section 3.5.3.1, shall be less than 0.025 for Life Safety and 0.015 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.1)
C	NC	N/A	AXIAL STRESS CHECK: The axial stress due to gravity loads in columns subjected to overturning forces shall be less than 0.10*Fy* for Life Safety and Immediate Occupancy. Alternatively, the axial stress due to overturning forces alone, calculated using the Quick Check procedure of Section 3.5.3.6, shall be less than *0.30Fy* for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.2)

Connections

C	NC	N/A	TRANSFER TO STEEL FRAMES: Diaphragms shall be connected for transfer of loads to the steel frames for Life Safety, and the connections shall be able to develop the lesser of the strength of the frames or the diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.2)

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 9 – MAIN BUILDING, CLASSROOMS & LABS Sheet 3 of 3

C	NC	N/A	STEEL COLUMNS: The columns in lateral-force-resisting frames shall be anchored to the building foundation for Life Safety, and the anchorage shall be able to develop the lesser of the tensile capacity of the column, the tensile capacity of the lowest level column splice (if any), or the uplift capacity of the foundation, for Immediate Occupancy. (Tier 2: Sec. 4.6.3.1)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 9 – MAIN BUILDING, CLASSROOMS & LABS Sheet 1 of 3

Lateral-Force-Resisting System

C	NC	N/A	MOMENT-RESISTING CONNECTIONS: All moment connections shall be able to develop the strength of the adjoining members or panel zones. (Tier 2: Sec. 4.4.1.3.3)
C	NC	N/A	PANEL ZONES: All panel zones shall have the shear capacity to resist the shear demand required to develop 0.8 times the sum of the flexural strengths of the girders framing in at the face of the column. (Tier 2: Sec. 4.4.1.3.4)
C	NC	N/A	COLUMN SPLICES: All column splice details located in moment-resisting frames shall include connection of both flanges and the web for Life Safety,, and the splice shall develop the strength of the column for Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.5)
C	NC	N/A	STRONG COLUMN/WEAK BEAM: The percentage of strong column/weak beam joints in each story of each line of moment-resisting frames shall be greater than *50* percent for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.6)
C	NC	N/A	COMPACT MEMBERS: All frame elements shall meet section requirements set forth by *Seismic Provisions for Structural Steel Buildings* Table I-9-1 (AISC, 1997). (Tier 2: Sec. 4.4.1.3. 7)
C	NC	N/A	BEAM PENETRATIONS: All openings in frame-beam webs shall be less than 1/4 of the beam depth and shall be located in the center half of the beams. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.8)
C	NC	N/A	GIRDER FLANGE CONTINUITY PLATES: There shall be girder flange continuity plates at all moment-resisting frame joints. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.9)
C	NC	N/A	OUT-OF-PLANE BRACING: Beam-column joints shall be braced out-of-plane. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3. I 0)
C	NC	N/A	BOTTOM FLANGE BRACING: The bottom flanges of beams shall be braced out-of-plane. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.11)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 9 MAIN BUILDING, CLASSROOMS & LABS Sheet 2 of 3

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant corners or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-l for Life Safety and 3-to-l for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-I. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7. 1)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 9 – MAIN BUILDING, CLASSROOMS & LABS Sheet 3 of 3

Connections

C	**NC**	**N/A**	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

Basic Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 9 – MAIN BUILDING, CLASSROOMS & LABS Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1 . 1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and immediate Occupancy. (Tier 2: Sec. 4.3. 1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1l)

Basic Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 9 – MAIN BUILDING, CLASSROOMS & LABS Sheet 2 of 3

C	NC	N/A	PRECAST CONCRETE WALLS: There shall be no visible deterioration of concrete or reinforcing steel or evidence of distress, especially at the connections. (Tier 2: Sec. 4.3.3.6)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the precast panels, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the greater of 10 psi or $2(f'c)^{0.5}$ for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.3.1)
C	NC	N/A	REINFORCING STEEL: The ratio of reinforcing steel area to gross concrete area shall be not less than 0.0015 in the vertical direction and 0.0025 in the horizontal direction for Life Safety and Immediate Occupancy. The spacing of reinforcing steel shall be equal 10 or less than 18 inches for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.3.2)

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls 1hat are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3. 7. (Tier 2: Sec. 4.6. 1.1)
C	NC	N/A	WOOD LEDGERS: The connection between the wall panels and the diaphragm shall not induce cross-grain bending or tension in the wood ledgers. (Tier 2: Sec. 4.6. 1 .2)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)

Basic Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 9 – MAIN BUILDING, CLASSROOMS & LABS Sheet 3 of 3

C	**NC**	**N/A**	PRECAST WALL PANELS: Precast wall panels shall be connected to the foundation for Life Safety and the connections shall be able to develop the strength of the walls for Immediate Occupancy. (Tier2: Sec. 4.6.3.7)
C	**NC**	**N/A**	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 9 – MAIN BUILDING, CLASSROOMS & LABS Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	COUPLING BEAMS: The stirrups in coupling beams over means of egress shall be spaced at or less than d/2 and shall be anchored into the confined core of the beam with hooks of 135° or more for Life Safety. All coupling beams shall comply with the requirements above and shall have the capacity in shear to develop the uplift capacity of the adjacent wall for Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.3)
C	NC	N/A	WALL OPENINGS: The total width of openings along any perimeter wall line shall constitute less than 75 percent of the length of any perimeter wall for Life Safety and 50 percent for Immediate Occupancy with the wall piers having aspect ratios of less than 2-to- l for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.3.3)
C	NC	N/A	CORNER OPENINGS: Walls with openings al a building comer larger than the width of a typical panel shall be connected to the remainder of the wall with collector reinforcing. (Tier 2: Sec. 4.4.2.3.4)
C	NC	N/A	PANEL-TO-PANEL CONNECTIONS: Adjacent wall panels shall be interconnected to transfer overturning forces between panels by methods other than welded steel inserts. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.3.5)
C	NC	N/A	WALL THICKNESS: Thickness of bearing walls shall not be less than 1125 the unsupported height or length, whichever is shorter, nor less than 4 inches. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.3.6)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant corners or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)

Supplemental Structural Checklist for Building Type PC1: Precast/Tilt-Up Concrete Shear Walls with Flexible Diaphragms
BUILDING 9 – MAIN BUILDING, CLASSROOMS & LABS Sheet 2 of 2

C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5. 1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-l for Life Safety and 3-to-l for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7. 1)

Connections

C	NC	N/A	PRECAST PANEL CONNECTIONS: There shall be at least two anchors from each precast wall panel into the diaphragm elements for Life Safety and the anchors shall be able to develop the strength of the panels for Immediate Occupancy. (Tier 2: Sec. 4.6.1.3)
C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3. 10)
C	NC	N/A	GIRDERS: Girders supported by walls or pilasters shall have at least two ties securing the anchor bolts for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.6.4.2)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 9 – STORAGE BUILDING Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 8- percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety an Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 9 – STORAGE BUILDING Sheet 2 of 3

C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next Life safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)
C	NC	N/A	MASONRY UNITS: There shall be no visible deterioration of masonry units. (Tier 2: Sec. 4.3.3.7)
C	NC	N/A	MASONRY JOINTS: The mortar shall not be easily scraped away from the joints by hand with a metal tool, and there shall be no areas of eroded mortar. (Tier 2: Sec. 4.3.3.8)
C	NC	N/A	REINFORCED MASONRY WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 118 inch for Life Safety and 1/16 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.10)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in I.be reinforced masonry shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than 70 psi for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.4.1)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 9 – STORAGE BUILDING Sheet 3 of 3

C	NC	N/A	REINFORCING STEEL: The total vertical and horizontal reinforcing steel ratio in reinforced masonry walls shall be greater than 0.002 for Life Safety and Immediate Occupancy of the wall with the minimum of 0.0007 for Life Safety and Immediate Occupancy in either of the two directions; the spacing of reinforcing steel shall be less than 48 inches for Life Safety and Immediate Occupancy; and all vertical bars shall extend to the top of the walls. (Tier 2: Sec. 4.4.2.4.2)

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3. 7. (Tier 2: Sec. 4.6.1.1)
C	NC	N/A	WOOD LEDGERS: The connection between the wall panels and the diaphragm shall not induce cross-grain bending or tension in the wood ledgers. (Tier 2: Sec. 4.6.1.2)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)
C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 9 – STORAGE BUILDING Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	REINFORCING AT OPENINGS: All wall openings that interrupt rebar shall have trim reinforcing on all sides. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.3)
C	NC	N/A	PROPORTIONS: The height-to-thickness ratio of the shear walls at each story shall be less than 30. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.4)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.4)
C	NC	N/A	OPENINGS AT EXTERIOR MASONRY SHEAR WALLS: Diaphragm openings immediately adjacent to exterior masonry shear walls shall not be greater than 8 feet long for Life Safety and 4 feet long for Immediate Occupancy. (Tier 2: Sec. 4.5.1.6)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	NA	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 9 – STORAGE BUILDING Sheet 2 of 2

C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-J for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-1. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5. 7.1)

Connections

C	NC	N/A	STIFFNESS OF WALL ANCHORS: Anchors of concrete or masonry walls to wood structural elements shall be installed taut and shall be stiff enough to limit the relative movement between the wall and the diaphragm to no greater than 1/8 inch prior to engagement of the anchors. (Tier 2:Sec. 4.6.1.4)

Basic Nonstructural Component Checklist Sheet 1 of 4
BUILDING 9 – CLASSROOMS & LABS

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 9 – CLASSROOMS & LABS

C	**NC**	**N/A**	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	**NC**	**N/A**	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	**NC**	**N/A**	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	**NC**	**N/A**	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	**NC**	**N/A**	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	**NC**	**N/A**	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	**NC**	**N/A**	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	**NC**	**N/A**	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist Sheet 3 of 4
BUILDING 9 – CLASSROOMS & LABS

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist
BUILDING 9 – CLASSROOMS & LABS

Sheet 4 of 4

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 9 – CLASSROOMS & LABS

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 9 – CLASSROOMS & LABS

C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.5 BUILDINGS 12 & 13

6.5.1 BUILDING 12 – BUSINESS EDUCATION

Building Description

YEAR OF CONSTRUCTION:	1953
YEAR OF ALTERATIONS:	1997 – Ceiling and Lighting Seismic Retrofit 1999 – Structural Seismic Retrofit
BUILDING TYPE:	W2, RM1

GENERAL BUILDING DESCRIPTION: The Business Education Building is a reinforced masonry brick structure measuring approximately 156 feet long by 40 feet wide and 14 feet tall. It was retrofitted in 1997: wood shear walls were added to the north exterior wall of the building, steel columns were added along the south exterior masonry wall, and roof-to-wall anchorage was upgraded in the roof diaphragm.

The building is primarily used as classrooms and is connected to Building 13 by a walkway canopy. The building appears in good condition, although there is deterioration in the freestanding masonry wing walls and walkway canopy. Also note that masonry at the wing walls is typically chalky to the touch (pictures Bldg12-07 & 08).

For exterior elevations and typical construction, see pictures Bldg12-01 to Bldg12-11.

VERTICAL STRUCTURAL SYSTEM: The structure contains a caisson foundation with grade beams around the perimeter of the structure and at interior walls. The floor level is concrete slab on grade. The wood roof rafters are supported by a central steel beam and exterior walls which span the length of the building. Along the north wall is a row of windows over half the height of the building.

LATERAL STRUCTURAL SYSTEM: The lateral system consists of new plywood added over the original diagonal roof sheathing. Reinforced masonry brick shear walls are present along the interior and exterior of the building. The north wall contains sections of wood shear walls added during the 1999 seismic retrofit. The retrofit also included addition of out-of-plane anchorage for the south masonry wall with steel tube columns, and the east and west interior and exterior masonry walls with retrofit roof diaphragm ties, plywood, and blocking.

NON-STRUCTURAL SYSTEMS: A walkway canopy to the south supports the mechanical units for the building with ducting along the adjacent longitudinal wall interior. The projectors in the classrooms are anchored properly. Lighting is hung from roof framing.

For non-structural systems and items present within the building, see picture Bldg12-12.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

2. PROXIMITY OF ADJACENT BUILDINGS: The clear distance between the reinforced masonry and walkway canopies does not conform to the minimum limit; walkway canopies are connected to both Buildings 12 and 13.
3. DETERIORATION OF WOOD: Walkway canopy wood framing supporting mechanical equipment showed signs of moderate deterioration (pictures Bldg12-10 to Bldg12-11).
4. MASONRY UNITS: Deterioration of masonry units in visible on the wing walls along the southern walkway (pictures Bldg12-07 to Bldg12-08).

Non-structural

5. INADEQUATE EQUIPMENT ATTACHMENT: Projector screens in classrooms are typically braced at 1 supported end only.
6. MECHANICAL EQUIPMENT ANCHORAGE: Mechanical equipment on the roof is not anchored to the roof structure.

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 12 – BUSINESS EDUCATION Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The Structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 8- percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety an Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 12 – BUSINESS EDUCATION Sheet 2 of 3

C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next Life safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)
C	NC	N/A	MASONRY UNITS: There shall be no visible deterioration of masonry units. (Tier 2: Sec. 4.3.3.7)
C	NC	N/A	MASONRY JOINTS: The mortar shall not be easily scraped away from the joints by hand with a metal tool, and there shall be no areas of eroded mortar. (Tier 2: Sec. 4.3.3.8)
C	NC	N/A	REINFORCED MASONRY WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 118 inch for Life Safety and 1/16 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.10)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in I.be reinforced masonry shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than 70 psi for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.4.1)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 12 – BUSINESS EDUCATION Sheet 3 of 3

C	NC	N/A	REINFORCING STEEL: The total vertical and horizontal reinforcing steel ratio in reinforced masonry walls shall be greater than 0.002 for Life Safety and Immediate Occupancy of the wall with the minimum of 0.0007 for Life Safety and Immediate Occupancy in either of the two directions; the spacing of reinforcing steel shall be less than 48 inches for Life Safety and Immediate Occupancy; and all vertical bars shall extend to the top of the walls. (Tier 2: Sec. 4.4.2.4.2)

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3. 7. (Tier 2: Sec. 4.6.1.1)
C	NC	N/A	WOOD LEDGERS: The connection between the wall panels and the diaphragm shall not induce cross-grain bending or tension in the wood ledgers. (Tier 2: Sec. 4.6.1.2)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)
C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 12 – BUSINESS EDUCATION Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	REINFORCING AT OPENINGS: All wall openings that interrupt rebar shall have trim reinforcing on all sides. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.3)
C	NC	N/A	PROPORTIONS: The height-to-thickness ratio of the shear walls at each story shall be less than 30. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.4)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.4)
C	NC	N/A	OPENINGS AT EXTERIOR MASONRY SHEAR WALLS: Diaphragm openings immediately adjacent to exterior masonry shear walls shall not be greater than 8 feet long for Life Safety and 4 feet long for Immediate Occupancy. (Tier 2: Sec. 4.5.1.6)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 12 – BUSINESS EDUCATION Sheet 2 of 2

C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-J for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-1. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5. 7.1)

Connections

C	NC	N/A	STIFFNESS OF WALL ANCHORS: Anchors of concrete or masonry walls to wood structural elements shall be installed taut and shall be stiff enough to limit the relative movement between the wall and the diaphragm to no greater than 1/8 inch prior to engagement of the anchors. (Tier 2:Sec. 4.6.1.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 12 – BUSINESS EDUCATION Sheet 1 of 4

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 12 – BUSINESS EDUCATION Sheet 2 of 4

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C	NC	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 12 – BUSINESS EDUCATION Sheet 3 of 4

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2. 7. 7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive tics capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 12 – BUSINESS EDUCATION Sheet 4 of 4

C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 12 – BUSINESS EDUCATION Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 12 – BUSINESS EDUCATION Sheet 2 of 2

C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end di stance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

Basic Nonstructural Component Checklist
BUILDING 12 – BUSINESS EDUCATION

Sheet 1 of 4

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist
BUILDING 12 – BUSINESS EDUCATION

Sheet 2 of 4

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	N/A	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist
BUILDING 12 – BUSINESS EDUCATION

Sheet 3 of 4

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 12 – BUSINESS EDUCATION

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 12 – BUSINESS EDUCATION

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 12 – BUSINESS EDUCATION

C	**NC**	**N/A**	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	**NC**	**N/A**	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	**NC**	**N/A**	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	**NC**	**N/A**	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.5.2 BUILDING 13 – BUSINESS EDUCATION

Building Description

YEAR OF CONSTRUCTION:	1953
YEAR OF ALTERATIONS:	1997 – Ceiling and Lighting Seismic Retrofit 1999 – Structural Seismic Retrofit
BUILDING TYPE:	W2, RM1

GENERAL BUILDING DESCRIPTION: The Business Education Building is a reinforced masonry brick structure measuring approximately 118 feet long by 40 feet wide and 14 feet tall. It was retrofitted in 1997: wood shear walls were added to the north exterior wall of the building, steel columns were added along the south exterior masonry wall, and roof-to-wall anchorage was upgraded in the roof diaphragm.

The building is primarily used as classrooms and is connected to Building 12 by a walkway canopy. The building appears in good condition, although there is considerable deterioration of the cantilever canopy at the southeast corner of the building (picture Bldg13-04).

For exterior elevations and typical construction, see pictures Bldg13-01 to Bldg13-05.

VERTICAL STRUCTURAL SYSTEM: The structure contains a caisson foundation with grade beams around the perimeter of the structure and under interior walls. The floor level is concrete slab on grade. The wood roof rafters are supported by a central steel beam and exterior walls for the north length of the building. Along the north wall is a row of windows half the height of the building. Roof purlins support wood subpurlins at the northern roof and cantilever past the exterior wall to support a canopy in this location.

LATERAL STRUCTURAL SYSTEM: The lateral system consists of new plywood added over original diagonal roof sheathing. Reinforced masonry brick shear walls are present along the interior and exterior of the building. The north wall contains sections of wood shear walls added during the 1999 seismic retrofit. The retrofit also included addition of out-of-plane anchorage for the south masonry wall with steel tube columns, and the east and west interior and exterior masonry walls with retrofit roof diaphragm ties, plywood, and blocking.

NON-STRUCTURAL SYSTEMS: A walkway canopy to the south of the building contains the mechanical units for the building. The projectors in the classrooms are anchored properly. Lighting is hung from roof framing.

For non-structural systems and items present within the building, see pictures Bldg13-06 to Bldg13-09.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. PROXIMITY OF ADJACENT BUILDINGS: The clear distance between the reinforced masonry and walkway canopies does not meet the limit; walkway canopies are connected to both Buildings 12 and 13.
2. DETERIORATION OF WOOD: Cantilever Canopy at front of building shows considerable damage and deterioration (picture Bldg13-04). Walkway canopy wood framing supporting mechanical equipment showed signs of moderate deterioration

Non-structural

3. TALL NARROW CONTENTS: Two server racks, two file cabinets in Room 105A, and one shelf system in Room 106A are not anchored (pictures Bldg13-08 to Bldg13-09).
4. INADEQUATE EQUIPMENT ATTACHMENT: Projector screens in classrooms are typically not adequately braced.
5. MECHANICAL EQUIPMENT ANCHORAGE: Mechanical equipment on the roof is not anchored to the roof structure

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 13 – BUSINESS EDUCATION Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The Structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 8- percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety an Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 13 – BUSINESS EDUCATION Sheet 2 of 3

C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next Life safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)
C	NC	N/A	MASONRY UNITS: There shall be no visible deterioration of masonry units. (Tier 2: Sec. 4.3.3.7)
C	NC	N/A	MASONRY JOINTS: The mortar shall not be easily scraped away from the joints by hand with a metal tool, and there shall be no areas of eroded mortar. (Tier 2: Sec. 4.3.3.8)
C	NC	N/A	REINFORCED MASONRY WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 118 inch for Life Safety and 1/16 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.10)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in I.be reinforced masonry shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than 70 psi for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.4.1)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 13 – BUSINESS EDUCATION Sheet 3 of 3

C	NC	N/A	REINFORCING STEEL: The total vertical and horizontal reinforcing steel ratio in reinforced masonry walls shall be greater than 0.002 for Life Safety and Immediate Occupancy of the wall with the minimum of 0.0007 for Life Safety and Immediate Occupancy in either of the two directions; the spacing of reinforcing steel shall be less than 48 inches for Life Safety and Immediate Occupancy; and all vertical bars shall extend to the top of the walls. (Tier 2: Sec. 4.4.2.4.2)

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3. 7. (Tier 2: Sec. 4.6.1.1)
C	NC	N/A	WOOD LEDGERS: The connection between the wall panels and the diaphragm shall not induce cross-grain bending or tension in the wood ledgers. (Tier 2: Sec. 4.6.1.2)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)
C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 13 – BUSINESS EDUCATION Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	REINFORCING AT OPENINGS: All wall openings that interrupt rebar shall have trim reinforcing on all sides. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.3)
C	NC	N/A	PROPORTIONS: The height-to-thickness ratio of the shear walls at each story shall be less than 30. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.4)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.4)
C	NC	N/A	OPENINGS AT EXTERIOR MASONRY SHEAR WALLS: Diaphragm openings immediately adjacent to exterior masonry shear walls shall not be greater than 8 feet long for Life Safety and 4 feet long for Immediate Occupancy. (Tier 2: Sec. 4.5.1.6)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 13 – BUSINESS EDUCATION Sheet 2 of 2

C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-J for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-1. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5. 7.1)

Connections

C	NC	N/A	STIFFNESS OF WALL ANCHORS: Anchors of concrete or masonry walls to wood structural elements shall be installed taut and shall be stiff enough to limit the relative movement between the wall and the diaphragm to no greater than 1/8 inch prior to engagement of the anchors. (Tier 2:Sec. 4.6.1.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 13 – BUSINESS EDUCATION Sheet 1 of 4

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 13 – BUSINESS EDUCATION Sheet 2 of 4

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C	NC	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 13 – BUSINESS EDUCATION Sheet 3 of 4

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2. 7. 7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive tics capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 13 – BUSINESS EDUCATION Sheet 4 of 4

C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 13 – BUSINESS EDUCATION Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 13 – BUSINESS EDUCATION Sheet 2 of 2

C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end di stance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

Basic Nonstructural Component Checklist
BUILDING 13 – BUSINESS EDUCATION

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist
BUILDING 13 – BUSINESS EDUCATION

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	N/A	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist Sheet 3 of 397
BUILDING 13 – BUSINESS EDUCATION

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 397
BUILDING 13 – BUSINESS EDUCATION

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 203 of 397

BUILDING 13 – BUSINESS EDUCATION

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 397

BUILDING 13 – BUSINESS EDUCATION

C	**NC**	**N/A**	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	**NC**	**N/A**	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	**NC**	**N/A**	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	**NC**	**N/A**	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.6 BUILDINGS 35 TO 39

6.6.1 BUILDING 35 – EAST MATH WING

Building Description

YEAR OF CONSTRUCTION: 1956
YEAR OF ALTERATIONS: 1997 – Ceiling and Lighting Seismic Retrofit
BUILDING TYPE: S1A, W2

GENERAL BUILDING DESCRIPTION: The East Math Wing building is mostly wood frame construction. It is approximately 14 feet high, 33 feet wide and 150 feet long. The building is joined to the West Math Wing by a walkway canopy; additionally the walkway extends to Building 37, 38 and 39. The building is currently being used as classrooms and staff offices.

It appears in good condition and there is no visible wood deterioration. There is deterioration evident in the exterior masonry wing walls (pictures Bldg35-06 and Bldg35-07).

For exterior elevations and typical construction, see pictures Bldg35-01 to Bldg35-07.

VERTICAL STRUCTURAL SYSTEM: The foundation is composed of caissons connected with grade beams around the perimeter and along interior walls. The floor construction is concrete slab is on grade. The wood roof rafters are supported by a central steel beam and exterior wood walls or headers. The entire length of the north wall contains windows spanning half the height of wall. The windows are separated with small steel columns embedded in a reinforced masonry wall that runs from the ground to the window sill. The remaining exterior and interior walls are wood stud walls.

LATERAL STRUCTURAL SYSTEM: The building contains plywood shear walls. There is no evident lateral system along the south exterior wall; wood shear walls shown in existing drawings are not present. Along the north exterior wall, there are steel moment frames. The roof diaphragm is unblocked plywood sheathing. No cross ties are present in the roof diaphragm.

NON-STRUCTURAL SYSTEMS: It appears mechanical units were at one time located on the roof of the structure and have been moved to the walkway canopies shared between Building 35, 36, and 39. The walkways may not be adequate for the weight of mechanical units. The ceiling and lighting systems appear to be current and in good condition. Screen projects in some classrooms are not adequately braced. In one particular room there are light fixtures which are not independently supported. There is also a drop ceiling with no sway wires.

For non-structural systems and items present within the building, see pictures Bldg35-08 to Bldg35-12.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. PROXIMITY OF ADJACENT BUILDINGS: The clear distance between the building and walkway canopies does not conform to the minimum limit; walkway canopies are connected between Buildings 35-39.
2. UNACCEPTABLE DRIFT AT MOMENT FRAMES: The drift ratio is greater than the limit of 0.025 for Life Safety.
3. UNACCEPTABLE STEEL MOMENT FRAMES: Moment-resisting connections, panel zone shear capacities and strong column/weak beam criteria are unacceptable and the governing criteria is not met.
4. NO CROSS TIES: There are no cross ties between diaphragm chords.
5. UNBLOCKED DIAPHRAGM SPAN: The maximum unblocked plywood diaphragm horizontal span is 41 feet, greater than the 40 feet limit for Life Safety.
6. REDUNDANCY: The south longitudinal direction does not contain any plywood shear walls.
7. OPENINGS: No wood structural panel shear walls are present for bracing at the south longitudinal wall.
8. MASONRY UNITS: Masonry units of wing walls along the south side of the building show minor signs of deterioration (pictures Bldg35-06 & Bldg35-07). Note this item is not covered on a check list for Building 35 due to building type, but should still be considered a deficiency.

Non-structural

9. TALL NARROW CONTENTS: Bookshelves in the staff office are unanchored (pictures Bldg35-10 to Bldg35-12).
10. INADEQUATE EQUIPMENT ATTACHMENT: Screen projectors in some classrooms are not adequately braced.
11. NO INDEPENDENT SUPPORT, LIGHT FIXTURES: Light fixtures in Rooms 152 and 153 are not supported independent of the suspended ceiling.
12. MECHANICAL EQUIPMENT ANCHORAGE: Mechanical equipment on the shared walkway canopy is not anchored to the structure.

Additional Observations

A significant amount of ponding water is present around the existing mechanical units on the canopy roof connecting Buildings 35 and 36 to Building 39 (pictures Bldg39-07 & Bldg39-08).

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 35 – MATH WING Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1 .2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 35 – MATH WING Sheet 2 of 3

C	NC	N/A	DETERIORATION OF STEEL: There shall be no visible rusting, corrosion, cracking, or other deterioration in any of the steel elements or connections in the vertical- or lateral-force-resisting systems. (Tier 2: Sec. 4.3.3.3)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of moment frames in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. The number of bays of moment frames in each line shall be greater than or equal 10 2 for Life Safety and 3 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.1.1)
C	NC	N/A	INTERFERING WALLS: All concrete and masonry infill walls placed in moment frames shall be isolated from structural elements. (Tier 2: Sec. 4.4.1.2.1)
C	NC	N/A	DRIFT CHECK: The drift ratio of the steel moment frames, calculated using the Quick Check procedure of Section 3.5.3.1, shall be less than 0.025 for Life Safety and 0.015 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.1)
C	NC	N/A	AXIAL STRESS CHECK: The axial stress due to gravity loads in columns subjected to overturning forces shall be less than 0.10*Fy* for Life Safety and Immediate Occupancy. Alternatively, the axial stress due to overturning forces alone, calculated using the Quick Check procedure of Section 3.5.3.6, shall be less than *0.30Fy* for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.2)

Connections

C	NC	N/A	TRANSFER TO STEEL FRAMES: Diaphragms shall be connected for transfer of loads to the steel frames for Life Safety, and the connections shall be able to develop the lesser of the strength of the frames or the diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.2)

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 35 – MATH WING Sheet 3 of 3

C	NC	N/A	STEEL COLUMNS: The columns in lateral-force-resisting frames shall be anchored to the building foundation for Life Safety, and the anchorage shall be able to develop the lesser of the tensile capacity of the column, the tensile capacity of the lowest level column splice (if any), or the uplift capacity of the foundation, for Immediate Occupancy. (Tier 2: Sec. 4.6.3.1)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 35 – MATH WING Sheet 1 of 3

Lateral-Force-Resisting System

C	**NC**	**N/A**	MOMENT-RESISTING CONNECTIONS: All moment connections shall be able to develop the strength of the adjoining members or panel zones. (Tier 2: Sec. 4.4.1.3.3)
C	**NC**	**N/A**	PANEL ZONES: All panel zones shall have the shear capacity to resist the shear demand required to develop 0.8 times the sum of the flexural strengths of the girders framing in at the face of the column. (Tier 2: Sec. 4.4.1.3.4)
C	**NC**	**N/A**	COLUMN SPLICES: All column splice details located in moment-resisting frames shall include connection of both flanges and the web for Life Safety,, and the splice shall develop the strength of the column for Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.5)
C	**NC**	**N/A**	STRONG COLUMN/WEAK BEAM: The percentage of strong column/weak beam joints in each story of each line of moment-resisting frames shall be greater than *50* percent for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.6)
C	**NC**	**N/A**	COMPACT MEMBERS: All frame elements shall meet section requirements set forth by *Seismic Provisions for Structural Steel Buildings* Table I-9-1 (AISC, 1997). (Tier 2: Sec. 4.4.1.3. 7)
C	**NC**	**N/A**	BEAM PENETRATIONS: All openings in frame-beam webs shall be less than 1/4 of the beam depth and shall be located in the center half of the beams. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.8)
C	**NC**	**N/A**	GIRDER FLANGE CONTINUITY PLATES: There shall be girder flange continuity plates at all moment-resisting frame joints. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.9)
C	**NC**	**N/A**	OUT-OF-PLANE BRACING: Beam-column joints shall be braced out-of-plane. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3. I 0)
C	**NC**	**N/A**	BOTTOM FLANGE BRACING: The bottom flanges of beams shall be braced out-of-plane. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.11)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 35 – MATH WING Sheet 2 of 3

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant corners or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-l for Life Safety and 3-to-l for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-I. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7. 1)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 35 – MATH WING Sheet 3 of 3

Connections

C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial

BUILDING 35 – MATH WING Sheet 1 of 4

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 35 – MATH WING Sheet 2 of 4

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C	N	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 35 – MATH WING Sheet 3 of 4

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2. 7. 7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive tics capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 35 – MATH WING Sheet 4 of 4

C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 35 – MATH WING Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 35 – MATH WING Sheet 2 of 2

C	**NC**	**N/A**	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	**NC**	**N/A**	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	**NC**	**N/A**	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end di stance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

Basic Nonstructural Component Checklist Sheet 1 of 4
BUILDING 35 – MATH WING

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist
BUILDING 35 – MATH WING

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	N/A	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist Sheet 3 of 4
BUILDING 35 – MATH WING

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 35 – MATH WING

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 35 – MATH WING

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 35 – MATH WING

C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.6.2 BUILDING 36 – WEST MATH WING

Building Description

YEAR OF CONSTRUCTION: 1956
YEAR OF ALTERATIONS: 1959 – Building Addition
1997 – Ceiling and Lighting Seismic Retrofit
BUILDING TYPE: S1A, W2

GENERAL BUILDING DESCRIPTION: The West Math Wing building is mostly wood frame construction. It is approximately 14 feet high, 33 feet wide and 250 feet long. The original building was 160 feet long and an addition to the building was made in 1959. The addition's construction type is similar to the original structure. The building is joined with the East Math Wing by a walkway canopy; the canopy further connects to Buildings 37-39. The building is currently being used as classrooms.

It appears in good condition. There is no visible wood deterioration, but there is some minor, visible cracking in the concrete finish along the north wall's window sill (picture Bldg36-05).

For exterior elevations and typical construction, see pictures Bldg36-01 to Bldg36-04.

VERTICAL STRUCTURAL SYSTEM: The foundation is composed of caissons connected with grade beams around the perimeter and along interior walls. The floor construction is concrete slab on grade. The wood roof rafters are supported by a central steel beam and exterior wood walls or headers. The entire length of the north wall contains windows spanning half the height of wall. The windows are separated with small steel columns embedded in a reinforced masonry wall that runs from the ground to the window sill. The remaining exterior and interior walls are wood stud walls.

LATERAL STRUCTURAL SYSTEM: The building typically contains plywood shear walls. The north exterior wall contains steel moment frames. The roof rafters rest on a central steel beam which spans the length of the building. The roof diaphragm is unblocked plywood sheathing. No cross ties are present in the roof diaphragm.

NON-STRUCTURAL SYSTEMS: It appears mechanical units were at one time located on the roof of the structure and have been moved to the walkway canopies shared between Building 35, 36, and 39. The walkways may not be adequate for the weight of mechanical units. The ceiling and lighting systems appear to be current and in good condition. Screen projects in some classrooms are not adequately braced.

For non-structural systems and items present within the building, see pictures Bldg36-06 to Bldg36-09.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. PROXIMITY OF ADJACENT BUILDINGS: The clear distance between the building and walkway canopies does not conform to the minimum limit; walkway canopies are connected between Buildings 35-39.
2. UNACCEPTABLE DRIFT AT MOMENT FRAMES: The drift ratio is greater than the limit of 0.025 for Life Safety.
3. UNACCEPTABLE STEEL MOMENT FRAMES: Moment-resisting connections, panel zone shear capacities, and strong column / weak beam criteria are unacceptable and the governing criteria is not met.
4. NO CROSS TIES: There are no cross ties between diaphragm chords.
5. UNBLOCKED DIAPHRAGM SPAN: The maximum unblocked plywood diaphragm horizontal span is 41 feet, greater than the 40 feet limit for Life Safety.

Non-structural

6. INADEQUATE EQUIPMENT ATTACHMENT: Screen projectors in some classrooms are not adequately braced.
7. MECHANICAL EQUIPMENT ANCHORAGE: Mechanical equipment on the shared walkway canopy is not anchored to the structure.

Additional Observations

A significant amount of ponding water is typically present on the roof around the existing mechanical units located on the canopy connecting Buildings 35 and 36 to Building 39 (pictures Bldg39-07 & Bldg39-08).

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms

BUILDING 36 – MATH WING

Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1 .2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms

BUILDING 36 – MATH WING Sheet 2 of 3

C	NC	N/A	DETERIORATION OF STEEL: There shall be no visible rusting, corrosion, cracking, or other deterioration in any of the steel elements or connections in the vertical- or lateral-force-resisting systems. (Tier 2: Sec. 4.3.3.3)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of moment frames in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. The number of bays of moment frames in each line shall be greater than or equal 10 2 for Life Safety and 3 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.1.1)
C	NC	N/A	INTERFERING WALLS: All concrete and masonry infill walls placed in moment frames shall be isolated from structural elements. (Tier 2: Sec. 4.4.1.2.1)
C	NC	N/A	DRIFT CHECK: The drift ratio of the steel moment frames, calculated using the Quick Check procedure of Section 3.5.3.1, shall be less than 0.025 for Life Safety and 0.015 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.1)
C	NC	N/A	AXIAL STRESS CHECK: The axial stress due to gravity loads in columns subjected to overturning forces shall be less than 0.10*Fy* for Life Safety and Immediate Occupancy. Alternatively, the axial stress due to overturning forces alone, calculated using the Quick Check procedure of Section 3.5.3.6, shall be less than *0.30Fy* for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.2)

Connections

C	NC	N/A	TRANSFER TO STEEL FRAMES: Diaphragms shall be connected for transfer of loads to the steel frames for Life Safety, and the connections shall be able to develop the lesser of the strength of the frames or the diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.2)

Basic Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 36 – MATH WING Sheet 3 of 3

C	NC	N/A	STEEL COLUMNS: The columns in lateral-force-resisting frames shall be anchored to the building foundation for Life Safety, and the anchorage shall be able to develop the lesser of the tensile capacity of the column, the tensile capacity of the lowest level column splice (if any), or the uplift capacity of the foundation, for Immediate Occupancy. (Tier 2: Sec. 4.6.3.1)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 36 – MATH WING Sheet 1 of 3

Lateral-Force-Resisting System

C	NC	N/A	MOMENT-RESISTING CONNECTIONS: All moment connections shall be able to develop the strength of the adjoining members or panel zones. (Tier 2: Sec. 4.4.1.3.3)
C	NC	N/A	PANEL ZONES: All panel zones shall have the shear capacity to resist the shear demand required to develop 0.8 times the sum of the flexural strengths of the girders framing in at the face of the column. (Tier 2: Sec. 4.4.1.3.4)
C	NC	N/A	COLUMN SPLICES: All column splice details located in moment-resisting frames shall include connection of both flanges and the web for Life Safety,, and the splice shall develop the strength of the column for Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.5)
C	NC	N/A	STRONG COLUMN/WEAK BEAM: The percentage of strong column/weak beam joints in each story of each line of moment-resisting frames shall be greater than *50* percent for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.3.6)
C	NC	N/A	COMPACT MEMBERS: All frame elements shall meet section requirements set forth by *Seismic Provisions for Structural Steel Buildings* Table I-9-1 (AISC, 1997). (Tier 2: Sec. 4.4.1.3. 7)
C	NC	N/A	BEAM PENETRATIONS: All openings in frame-beam webs shall be less than 1/4 of the beam depth and shall be located in the center half of the beams. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.8)
C	NC	N/A	GIRDER FLANGE CONTINUITY PLATES: There shall be girder flange continuity plates at all moment-resisting frame joints. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.9)
C	NC	N/A	OUT-OF-PLANE BRACING: Beam-column joints shall be braced out-of-plane. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3. I 0)
C	NC	N/A	BOTTOM FLANGE BRACING: The bottom flanges of beams shall be braced out-of-plane. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.3.11)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 36 – MATH WING Sheet 2 of 3

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant corners or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-l for Life Safety and 3-to-l for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-I. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7. 1)

Supplemental Structural Checklist for Building Type S1A: Steel Moment Frames with Flexible Diaphragms
BUILDING 36 – MATH WING Sheet 3 of 3

Connections

C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial

BUILDING 36 – MATH WING Sheet 1 of 4

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 36 – MATH WING Sheet 2 of 4

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C	N	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 36 – MATH WING Sheet 3 of 4

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2. 7. 7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive tics capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 36 – MATH WING Sheet 4 of 4

C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 36 – MATH WING Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 36 – MATH WING Sheet 2 of 2

C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end di stance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

Basic Nonstructural Component Checklist Sheet 1 of 4
BUILDING 36 – MATH WING

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 36 – MATH WING

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	N/A	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist Sheet 3 of 4
BUILDING 36 – MATH WING

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 36 – MATH WING

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 36 – MATH WING

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 36 – MATH WING

C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.6.3 BUILDING 37 – REPROGRAPHICS

Building Description

YEAR OF CONSTRUCTION: 1956
YEAR OF ALTERATIONS: 1987 – Cooling System Upgrade and Maintenance
1996 – Computer Lab Renovation
1997 – Ceiling and Lighting Seismic Retrofit
BUILDING TYPE: RM1, W2

GENERAL BUILDING DESCRIPTION: The current Reprographics building was constructed in 1956 per the original structural drawings. It is a one story reinforced masonry and wood frame building, approximately 15 feet high with a plan area of approximately 80 by 80 feet. There is a parapet around the perimeter of the building's roof and an exterior staircase for roof access. Exterior walkway canopies which connect adjacent buildings are supported by pipe posts and the exterior building walls. A 12 foot wide section of low roof is located at the NE end of the building. The building houses classrooms, copy and printing equipment, storage, mechanical equipment and restrooms.

The building appears to be in fair to good condition. The masonry walls appear to be in good condition; some exterior wood framing shows deterioration (picture Bldg37-13).

For exterior elevations and typical construction, see pictures Bldg37-01 to Bldg37-12.

VERTICAL STRUCTURAL SYSTEM: The building utilizes both reinforced masonry and wood stud load bearing walls. The foundation consists of caissons connected with grade beams supporting interior and exterior walls. The floor is concrete slab on grade and contains two locations of trenches which are covered by plywood and carpet. The plywood is deflecting noticeably in one location.

LATERAL STRUCTURAL SYSTEM: The building contains a dual lateral system. Reinforced masonry shear walls are used in the NE-SW direction. In the NW-SE direction, the system is plywood shear walls on the NE side and reinforced masonry walls on the SW side. The roof consists of plywood sheathing over roof rafters. A few areas of the roof are detailed on the drawings as blocked, while the majority of the roof is detailed as unblocked.

NON-STRUCTURAL SYSTEMS: The ceilings were observed to have been changed since the original drawings. It is assumed this was in conjunction with the ceiling and light seismic retrofits performed in 1997. The high and low roofs contained mechanical systems and equipment. A room at the low roof contains original heating and cooling systems which appear to be decommissioned (picture Bldg37-03). There is also high voltage electrical and data panels within this space.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. PROXIMITY OF ADJACENT BUILDINGS: The clear distance between the building and walkway canopies does not conform to the minimum limit; walkway canopies are connected between Buildings 35-39.
2. LOAD PATH, NO COLLECTORS: Collectors at the roof level to at least one reinforced masonry shear wall do not appear to be detailed on the available structural drawings and could not be viewed.
3. DETERIORATION OF WOOD: An exterior location of wood damage was viewed at a low roof door jamb. A joist at the NW corner was viewed to be torqued with slight splitting observe. (picture Bldg37-13). Otherwise, wood typically appears to be in good condition.
4. INADEQUATE WALL ANCHORAGE: Wall anchorage of masonry walls to diaphragm are not detailed in available structural drawings. From our knowledge of this type of construction, it is unlikely that existing wall ties or straps have adequate strength or stiffness to resist the out-of-plane connection force calculated with the ASCE 31-03 Tier 1 Quick Check procedure.
5. NO CROSS TIES: There are typically no cross ties between diaphragm chords.
6. UNBLOCKED DIAPHRAGM SPAN: The low roof unblocked plywood diaphragm appears to have a horizontal span of greater than 40 feet for Life Safety.

Non-structural

7. TALL NARROW CONTENTS: 2-3 filing cabinets are not anchored to the floor slab or wall.
8. MECHANICAL EQUIPMENT ANCHORAGE: Mechanical equipment on the roof is not anchored to the roof structure (picture Bldg37-14). Multiple mechanical equipment units on vibration isolators on the roof are not equipped with restraints or snubbers. In the equipment room located at the low roof, at least 1 boiler is not anchored. Note that equipment in this area is not in use.
9. NO CLIPS AT LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors are not secured with clips.

Additional Observations

Moderate ponding was typically viewed at the high and low roofs (picture Bldg37-05).

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms

BUILDING 37 – REPROGRAPHICS Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The Structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 8- percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety an Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 37 – REPROGRAPHICS Sheet 2 of 3

C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next Life safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)
C	NC	N/A	MASONRY UNITS: There shall be no visible deterioration of masonry units. (Tier 2: Sec. 4.3.3.7)
C	NC	N/A	MASONRY JOINTS: The mortar shall not be easily scraped away from the joints by hand with a metal tool, and there shall be no areas of eroded mortar. (Tier 2: Sec. 4.3.3.8)
C	NC	N/A	REINFORCED MASONRY WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 118 inch for Life Safety and 1/16 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.10)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in I.be reinforced masonry shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than 70 psi for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.4.1)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 37 – REPROGRAPHICS Sheet 3 of 3

C	NC	N/A	REINFORCING STEEL: The total vertical and horizontal reinforcing steel ratio in reinforced masonry walls shall be greater than 0.002 for Life Safety and Immediate Occupancy of the wall with the minimum of 0.0007 for Life Safety and Immediate Occupancy in either of the two directions; the spacing of reinforcing steel shall be less than 48 inches for Life Safety and Immediate Occupancy; and all vertical bars shall extend to the top of the walls. (Tier 2: Sec. 4.4.2.4.2)

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3. 7. (Tier 2: Sec. 4.6.1.1)
C	NC	N/A	WOOD LEDGERS: The connection between the wall panels and the diaphragm shall not induce cross-grain bending or tension in the wood ledgers. (Tier 2: Sec. 4.6.1.2)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)
C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 37 – REPROGRAPHICS Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	REINFORCING AT OPENINGS: All wall openings that interrupt rebar shall have trim reinforcing on all sides. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.3)
C	NC	N/A	PROPORTIONS: The height-to-thickness ratio of the shear walls at each story shall be less than 30. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.4)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.4)
C	NC	N/A	OPENINGS AT EXTERIOR MASONRY SHEAR WALLS: Diaphragm openings immediately adjacent to exterior masonry shear walls shall not be greater than 8 feet long for Life Safety and 4 feet long for Immediate Occupancy. (Tier 2: Sec. 4.5.1.6)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 37 – REPROGRAPHICS Sheet 2 of 2

C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-J for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-1. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5. 7.1)

Connections

C	NC*	N/A	STIFFNESS OF WALL ANCHORS: Anchors of concrete or masonry walls to wood structural elements shall be installed taut and shall be stiff enough to limit the relative movement between the wall and the diaphragm to no greater than 1/8 inch prior to engagement of the anchors. (Tier 2:Sec. 4.6.1.4)

* Item not visible during site visit, statement completed based on general knowledge of construction type.

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 37 – REPROGRAPHICS Sheet 1 of 4

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 37 – REPROGRAPHICS Sheet 2 of 4

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C	NC	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 37 – REPROGRAPHICS Sheet 3 of 4

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2. 7. 7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive tics capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 37 – REPROGRAPHICS Sheet 4 of 4

C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial

BUILDING 37 – REPROGRAPHICS Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 37 – REPROGRAPHICS Sheet 2 of 2

C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end di stance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

Basic Nonstructural Component Checklist Sheet 1 of 4
BUILDING 37 – REPROGRAPHICS

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 37 – REPROGRAPHICS

C	**NC**	**N/A**	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	**NC**	**N/A**	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	**NC**	**N/A**	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	**NC**	**N/A**	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	**NC**	**N/A**	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	**NC**	**N/A**	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	**NC**	**N/A**	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	**NC**	**N/A**	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist
BUILDING 37 – REPROGRAPHICS

Sheet 3 of 4

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 37 – REPROGRAPHICS

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 37 – REPROGRAPHICS

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	N	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 37 – REPROGRAPHICS

C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.6.4 BUILDING 38 – SMALL OFFICE ADDITION

Building Description

YEAR OF CONSTRUCTION: 1956
YEAR OF ALTERATIONS: 1997 – Light and Ceiling Seismic Retrofit
BUILDING TYPE: W2 (The building does not strictly adhere to any of the typical wood building types. The type chosen most closely matches existing building characteristics.)

GENERAL BUILDING DESCRIPTION: The Office Addition is a 1 story wood framed building, approximately 10 feet high, and 13 feet wide by 32 feet long. It houses offices and appears to be in good condition with no signs of major deterioration.

For exterior elevations and typical construction, see pictures Bldg38-01 to Bldg38-04.

VERTICAL STRUCTURAL SYSTEM: The vertical system consists of wood roof rafters spanning between wood stud walls. The foundation is a conventional system with continuous concrete footings at each load bearing wall location. The floor is slab on grade.

LATERAL STRUCTURAL SYSTEM: The lateral system is plywood sheathed roof diaphragm with plywood sheathed shear walls.

NON-STRUCTURAL SYSTEMS: Mechanical units are located on the roof of the building. Acoustical ceilings and lights are attached directly to roof rafters.

For non-structural systems and items present within the building, see pictures Bldg38-05 to Bldg38-06.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. REDUNDANCY: The longitudinal direction only contains 1 line of plywood shear walls. The north exterior wall has no lateral system from the roof diaphragm to the foundation.
2. OPENINGS: North wall has windows along entire length, and no wood structural panel shear walls are present for bracing.

Non-structural

3. TALL NARROW CONTENTS: At least 1 bookshelf over 4 feet in height is not anchored to the floor or wall (picture Bldg38-06).
4. MECHANICAL EQUIPMENT ANCHORAGE: Mechanical equipment on the roof is not anchored to the roof structure.

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 38 – SMALL OFFICE ADDITION Sheet 1 of 4

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 38 – SMALL OFFICE ADDITION Sheet 2 of 4

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C *	NC	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 38 – SMALL OFFICE ADDITION Sheet 3 of 4

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2. 7. 7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive ties capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 38 – SMALL OFFICE ADDITION Sheet 4 of 4

C	**NC**	**N/A**	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

***** Item not visible during site visit, statement completed based on general knowledge of construction type.

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial

BUILDING 38 – SMALL OFFICE ADDITION Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 38 – SMALL OFFICE ADDITION Sheet 2 of 2

C	**NC**	**N/A**	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	**NC**	**N/A**	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	**NC**	**N/A**	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end di stance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

Basic Nonstructural Component Checklist
BUILDING 38 – SMALL OFFICE ADDITION

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 38 – SMALL OFFICE ADDITION

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	N/A	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist
BUILDING 38 – SMALL OFFICE ADDITION

Sheet 3 of 4

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 38 – SMALL OFFICE ADDITION

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 38 – SMALL OFFICE ADDITION

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 38 – SMALL OFFICE ADDITION

C	**NC**	**N/A**	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	**NC**	**N/A**	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	**NC**	**N/A**	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	**NC**	**N/A**	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.6.5 BUILDING 39 – PLANETARIUM

Building Description

YEAR OF CONSTRUCTION: 1955
YEAR OF ALTERATIONS: unknown – Greenhouse and Pool Removal
unknown – Building Additions
BUILDING TYPE: C2, W2, RM1

GENERAL BUILDING DESCRIPTION: The Planetarium Building is a structure with a total of 2,380 square feet and consists of five areas:

1. A 24 foot diameter reinforced concrete dome measuring 20 feet high at the dome center with reinforced concrete shear walls standing 10 feet high.
2. A 12 feet wide by 48 feet long reinforced masonry room adjoining the dome to the north
3. Two new additions consisting of wood frame construction
4. A third new addition consisting of reinforced masonry construction.

The building is used as a classroom and for storage.

For exterior elevations and typical construction, see pictures Bldg39-01 to Bldg39-06.

VERTICAL STRUCTURAL SYSTEM: The dome area is entirely reinforced concrete construction while the wood and reinforced masonry wall areas consist of wood framed roofs. The original drawings show the foundation to be caissons connected with grade beams at the building perimeter. The building floor is slab on grade. Because no drawings are available for the majority of the additions and the exact structural detailing is mostly nonvisible, assumptions have been made based on viewable construction style and detailing.

LATERAL STRUCTURAL SYSTEM: The dome is a rigid diaphragm supported by concrete shear walls. The reinforced masonry areas contain reinforced masonry shear walls and wood diaphragms. The undocumented masonry walls are assumed to be detailed similarly to the original masonry walls. The wood framed areas contain wood shear walls and wood diaphragms. It is assumed the diaphragm and walls are composed of either diagonal or structural panel sheathing. Additional assumptions are noted in the checklists.

NON-STRUCTURAL SYSTEMS: Much of the roof areas support mechanical units, some on roof curbs and some on vibration isolators, all of which appear to be in good condition, but are unanchored to the roof. For non-structural systems and items present within the building, see pictures Bldg39-07 to Bldg39-11.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. PROXIMITY OF ADJACENT BUILDINGS: Reinforced masonry building directly abuts the reinforced concrete dome structure. Additionally, a walkway canopy is directly attached and also connects to Buildings 35-38.
2. INADEQUATE WALL ANCHORAGE: Wall anchorages of masonry walls to the diaphragm do not have the adequate strength or stiffness to resist the out-of-plane connection force calculated by the ASCE 31-03 Tier 1 Quick Check Procedure.
3. CROSS-TIES INADEQUATE: Continuous cross-ties between diaphragm chords are inadequate at areas of reinforced masonry walls.

Non-structural

4. TALL NARROW CONTENTS: A row of lockers in a storage area is unanchored.
5. MECHANICAL EQUIPMENT ANCHORAGE: Mechanical equipment on the roof is not anchored to the structure. See picture Bldg39-11.

Additional Observations

A considerable amount of ponding was observed on a portion of the walkway canopy connected to the structure (picture Bldg39-08).

Basic Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 39 –PLANETARIUM DOME Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 39 – PLANETARIUM DOME Sheet 2 of 3

C	NC	N/A	TORSION: The estimated distance between the story center of mass and the story center of rigidity shall be less than 20 percent of the building width in either plan dimension for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.6)
C	NC	N/A	DETERIORATION OF CONCRETE: There shall be no visible deterioration of concrete or reinforcing steel in any of the vertical- or lateral-force-resisting elements. (Tier 2: Sec. 4.3.3.4)
C	NC	N/A	POST-TENSIONING ANCHORS: There shall be no evidence of corrosion or spalling in the vicinity of post-tensioning or end fittings. Coil anchors shall not have been used. (Tier 2: Sec. 4.3.3.5)
C	NC	N/A	CONCRETE WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 118 inch for Life Safety and 1/16 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.9)

Lateral-Force-Resisting System

C	NC	N/A	COMPLETE FRAMES: Steel or concrete frames classified as secondary components shall form a complete vertical-load-carrying system. (Tier 2: Sec. 4.4.1.6.1)
C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the concrete shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the greater of 100 psi or 2*sqrt(f’c) for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.1)
C	NC	N/A	REINFORCING STEEL: The ratio of reinforcing steel area to gross concrete area shall be not less than 0.0015 in the vertical direction and 0.0025 in the horizontal direction for Life Safety and Immediate Occupancy. The spacing of reinforcing steel shall be equal to or less than 18 inches for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.2)

Basic Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 39 – PLANETARIUM DOME Sheet 3 of 3

Connections

C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)

Supplemental Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 39 – PLANETARIUM DOME Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	DEFLECTION COMPATIBILITY: Secondary components shall have the shear capacity to develop the flexural strength of the components for Life Safety and shall meet the requirements of Sections 4.4.1.4.9, 4.4.1.4.10, 4.4.1.4.11, 4.4.1.4.12 and 4.4.1.4.15 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.6.2)
C	NC	N/A	FLAT SLABS: Flat slabs/plates not part of lateral-force-resisting system shall have continuous bottom steel through the column joints for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.6.3)
C	NC	N/A	COUPLING BEAMS: The stirrups in coupling beams over means of egress shall be spaced at or less than d/2 and shall be anchored into the confined core of the beam with hooks of 135° or more for Life Safety. All coupling beams shall comply with the requirements above and shall have the capacity in shear to develop the uplift capacity of the adjacent wall for Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.3)
C	NC	N/A	OVERTURNING: All shear walls shall have aspect ratios less than 4-to-1. Wall piers need not be considered. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.4)
C	NC	N/A	CONFINEMENT REINFORCING: For shear walls with aspect ratios greater than 2-to-1, the boundary elements shall be confined with spirals or ties with spacing less than $8d_b$.This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.5)
C	NC	N/A	REINFORCING AT OPENINGS: There shall be added trim reinforcement around all wall openings with a dimension greater than three times the thickness of the wall. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.6)

Supplemental Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms

BUILDING 39 – PLANETARIUM DOME Sheet 2 of 2

C	**NC**	**N/A**	WALL THICKNESS: Thickness of bearing walls shall not be less than 1/25 the unsupported height or length, whichever is shorter, nor less than 4 inches. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.7)

Diaphragms

C	**NC**	**N/A**	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	**NC**	**N/A**	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.4)
C	**NC**	**N/A**	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	**NC**	**N/A**	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)

Connections

C	**NC**	**N/A**	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 39 – PLANETARIUM Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The Structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 8- percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety an Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 39 – PLANETARIUM Sheet 2 of 3

C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next Life safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3.1)
C	NC	N/A	MASONRY UNITS: There shall be no visible deterioration of masonry units. (Tier 2: Sec. 4.3.3.7)
C	NC	N/A	MASONRY JOINTS: The mortar shall not be easily scraped away from the joints by hand with a metal tool, and there shall be no areas of eroded mortar. (Tier 2: Sec. 4.3.3.8)
C	NC	N/A	REINFORCED MASONRY WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 118 inch for Life Safety and 1/16 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.10)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in I.be reinforced masonry shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than 70 psi for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.4.1)

Basic Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 39 – PLANETARIUM Sheet 3 of 3

C	NC	N/A	REINFORCING STEEL: The total vertical and horizontal reinforcing steel ratio in reinforced masonry walls shall be greater than 0.002 for Life Safety and Immediate Occupancy of the wall with the minimum of 0.0007 for Life Safety and Immediate Occupancy in either of the two directions; the spacing of reinforcing steel shall be less than 48 inches for Life Safety and Immediate Occupancy; and all vertical bars shall extend to the top of the walls. (Tier 2: Sec. 4.4.2.4.2)

Connections

C	NC	N/A	WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support shall be anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections shall have adequate strength to resist the connection force calculated in the Quick Check procedure of Section 3.5.3. 7. (Tier 2: Sec. 4.6.1.1)
C	NC	N/A	WOOD LEDGERS: The connection between the wall panels and the diaphragm shall not induce cross-grain bending or tension in the wood ledgers. (Tier 2: Sec. 4.6.1.2)
C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)
C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 39 – PLANETARIUM Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	REINFORCING AT OPENINGS: All wall openings that interrupt rebar shall have trim reinforcing on all sides. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.3)
C	NC	N/A	PROPORTIONS: The height-to-thickness ratio of the shear walls at each story shall be less than 30. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.4.4)

Diaphragms

C	NC	N/A	CROSS TIES: There shall be continuous cross ties between diaphragm chords. (Tier 2: Sec. 4.5.1.2)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.4)
C	NC	N/A	OPENINGS AT EXTERIOR MASONRY SHEAR WALLS: Diaphragm openings immediately adjacent to exterior masonry shear walls shall not be greater than 8 feet long for Life Safety and 4 feet long for Immediate Occupancy. (Tier 2: Sec. 4.5.1.6)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	NA	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)

Supplemental Structural Checklist for Building Type RM1: Reinforced Masonry Bearing Walls with Flexible Diaphragms
BUILDING 39 – PLANETARIUM Sheet 2 of 2

C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. (Tier 2: Sec. 4.5.2.2)
C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-J for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	NON-CONCRETE FILLED DIAPHRAGMS: Untopped metal deck diaphragms or metal deck diaphragms with fill other than concrete shall consist of horizontal spans of less than 40 feet and shall have span/depth ratios less than 4-to-1. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.3.1)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5. 7.1)

Connections

C	NC	N/A	STIFFNESS OF WALL ANCHORS: Anchors of concrete or masonry walls to wood structural elements shall be installed taut and shall be stiff enough to limit the relative movement between the wall and the diaphragm to no greater than 1/8 inch prior to engagement of the anchors. (Tier 2:Sec. 4.6.1.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 39 – PLANETARIUM ADDITION Sheet 1 of 4

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 39 – PLANETARIUM ADDITION Sheet 2 of 4

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C	NC	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C *	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 39 – PLANETARIUM ADDITION Sheet 3 of 4

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2. 7. 7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive tics capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C *	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 39 – PLANETARIUM ADDITION Sheet 4 of 4

C	**NC**	**N/A**	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

***** Item not visible during site visit, statement completed based on general knowledge of construction type.

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial

BUILDING 39 – PLANETARIUM ADDITION Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C*	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C*	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 39 – PLANETARIUM ADDITION Sheet 2 of 2

C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C *	NC	N/A	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end di stance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

* Item not visible during site visit, statement completed based on general knowledge of construction type.

Basic Nonstructural Component Checklist
BUILDING 39 – PLANETARIUM

Sheet 1 of 4

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 39 – PLANETARIUM

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	N/A	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist Sheet 3 of 4
BUILDING 39 – PLANETARIUM

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 39 – PLANETARIUM

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 39 – PLANETARIUM

Ceiling Systems

C	**NC**	**N/A**	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	**NC**	**N/A**	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	**NC**	**N/A**	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	**NC**	**N/A**	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	**NC**	**N/A**	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	**NC**	**N/A**	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 39 – PLANETARIUM

C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.7 BUILDINGS 93, 105 & 110

6.7.1 BUILDING 93 – POOL STADIUM

Building Description

YEAR OF CONSTRUCTION: 1953 (Structural drawings not available)
YEAR OF ALTERATIONS: 1992 – Pool Remodel & Equipment Maintenance
BUILDING TYPE: C1, C2

GENERAL BUILDING DESCRIPTION: The Pool Stadium consists of two in-ground pools and a reinforced concrete bleacher structure within the pool complex. The original architectural drawings are dated 1953, and no structural drawings are available. Pumps and other mechanical equipment are located at the underside of the bleacher structure. Minimal, mostly aesthetic work was done to the pool and the pool equipment located beneath the stadium in 1992.

The concrete pools appeared to be in good condition. The slab on grade surrounding the pools typically has minor to moderate cracking throughout.

The bleacher structure is approximately 14 feet high, 60 feet long and 24 feet wide. An adjacent canopy structure and partition wall is located to the west end of the bleachers and these are not attached to the bleachers structure. An approximately 12 feet wide by 4 feet deep pit area below grade consisting of concrete walls with a concrete slab is located along the east side beneath the bleachers. The concrete bleachers and pit area are typically in fair to good condition with minor spalling at the underside.

For exterior elevations and typical construction, see pictures Bldg93-01 to Bldg93-11.

VERTICAL STRUCTURAL SYSTEM: The Stadium is supported by three concrete columns at the west side. Girders span in the E-W direction from each column to the ground level on the east edge. The foundation is slab on grade. Due to the nature of the drawings available, details of the footing system is unknown, although an available original calculation sheet indicates caisson foundations at the column bents.

LATERAL STRUCTURAL SYSTEM: The lateral force resisting system is assumed to be a concrete shear wall at the east edge of the structure, where the pitch of the structure meets the foundation. This wall runs N-S and takes the lateral force in that direction. For the E-W direction, the lateral force resisting system is unclear. Due to the column geometry, it is assumed the structure likely has been designed utilizing 3 concrete bent moment frames in this direction.

NON-STRUCTURAL SYSTEMS: The primary location of the pool equipment is beneath the Stadium bleachers. The equipment consists of the chemical dosing system for the pool as well as ventilation ducts and equipment. There are several storage tanks, pumps, chemical dosers, and electrical boxes and cabinets located throughout this space. Some of the equipment and piping is out of commission.

For non-structural systems and items present within the building, see pictures Bldg93-17 to Bldg93-22.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. PROXIMITY OF ADJACENT BUILDINGS: The clear distance between the bleachers and canopy at the west end is less than 4 percent of the height. This can result in pounding at this location during a seismic event.
2. TORSIONAL IRREGULARITY: The estimated distance between the story center of mass and the story center of rigidity in the N-S direction is greater than 20 percent of the bleacher width.
3. DETERIORATION OF CONCRETE: The underside of reinforced concrete bleacher risers typically exhibits minor spalling with exposed rebar (picture Bldg93-13). Spalling was viewed at one overhead eye-bolt anchor location (picture Bldg93-14). At the joint with the canopy at west end, the underside of concrete bleacher slab exhibits major efflorescence along entire length, which is evidence of joint leakage (picture Bldg93-12).

Non-structural

4. STAIR ANCHORAGE: Ship's ladder into the pit area is not anchored at the top or bottom. Support relies on bracket connection at top concrete curb and rests on concrete slab below with no positive connection (picture Bldg93-20).
5. MECHANICAL AND ELECTRICAL EQUIPMENT ANCHORAGE: An electrical cabinet is not anchored to the concrete slab or wall (picture Bldg93-22). In the pit area, the concrete pad at one location of pump anchorage has failed (picture Bldg93-21).
6. NO BRACING AT ATTACHED EQUIPMENT: One large tank is hanging from the concrete bleachers without bracing.
7. NO FLEXIBLE COUPLINGS AT GAS TANK PIPES: Piping to one large tank appearing to store gas does not have flexible couplings. It appears as if this tank is no longer in use (picture Bldg93-19).

Additional Observations

Hazardous materials stored in flexible containers, including Muriatic Acid (picture Bldg93-17), did not appear to be anchored to the slab.

Basic Structural Checklist for Building Type C1: Concrete Moment Frames
BUILDING 93 – POOL STADIUM Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	NA	ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building shall be greater than 4 percent of the height of the shorter building for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.1.2)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)

Basic Structural Checklist for Building Type C1: Concrete Moment Frames
BUILDING 93 – POOL STADIUM Sheet 2 of 3

C	**NC**	**N/A**	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)
C	**NC**	**N/A**	TORSION: The estimated distance between the story center of mass and the story center of rigidity shall be less than 20 percent of the building width in either plan dimension for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.6)
C	**NC**	**N/A**	DETERIORATION OF CONCRETE: There shall be no visible deterioration of concrete or reinforcing steel in any of the vertical- or lateral-force-resisting elements. (Tier 2: Sec. 4.3.3.4)
C	**NC**	**N/A**	POST-TENSIONING ANCHORS: There shall be no evidence of corrosion or spalling in the vicinity of post-tensioning or end fittings. Coil anchors shall not have been used. (Tier 2: Sec. 4.3.3.5)

Lateral-Force-Resisting System

C	**NC**	**N/A**	REDUNDANCY: The number of lines of moment frames in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. The number of bays of moment frames in each line shall be greater than or equal to 2 for Life Safety and 3 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.1.1)
C	**NC**	**N/A**	INTERFERING WALLS: All concrete and masonry infill walls placed in moment frames shall be isolated from structural elements. (Tier 2: Sec. 4.4.1.2.1)
C	**NC**	**N/A**	SHEAR STRESS CHECK: The shear stress in the concrete columns, calculated using the Quick Check procedure of Section 3.5.3.2, shall be less than the greater of 100 psi or $2\sqrt{f'_c}$ for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.4.1)

Basic Structural Checklist for Building Type C1: Concrete Moment Frames
BUILDING 93 – POOL STADIUM Sheet 3 of 3

C	NC	N/A	AXIAL STRESS CHECK: The axial stress due to gravity loads in columns subjected to overturning forces shall be less than $0.1f'_c$ for Life Safety and Immediate Occupancy. Alternatively, the axial stresses due to overturning forces alone, calculated using the Quick Check procedure of Section 3.5.3.6, shall be less than $0.3f'_c$ for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.4.2)

Connections

C *	NC	N/A	CONCRETE COLUMNS: All concrete columns shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the tensile capacity of reinforcement in columns of lateral-force-resisting system for Immediate Occupancy. (Tier 2: Sec. 4.6.3.2)

* Item not visible during site visit, statement completed based on general knowledge of construction type.

Supplemental Structural Checklist for Building Type C1: Concrete Moment Frames
BUILDING 93 – POOL STADIUM Sheet 1 of 3

Lateral-Force-Resisting System

C	NC	N/A	FLAT SLAB FRAMES: The lateral-force-resisting system shall not be a frame consisting of columns and a flat slab/plate without beams. (Tier 2: Sec. 4.4.1.4.3)
C	NC	N/A	PRESTRESSED FRAME ELEMENTS: The lateral-force-resisting frames shall not include any prestressed or post-tensioned elements where the average prestress exceeds the lesser of 700 psi or f'_c / 6 at potential hinge locations. The average prestress shall be calculated in accordance with the Quick Check procedure of Section 3.5.3.8. (Tier 2: Sec. 4.4.1.4.4)
C	NC	N/A	CAPTIVE COLUMNS: There shall be no columns at a level with height/depth ratios less than 50 percent of the nominal height/depth ratio of the typical columns at that level for Life Safety and 75 percent for Immediate Occupancy. (Tier 2: Sec. 4.4.1.4.5)
C *	NC	N/A	NO SHEAR FAILURES: The shear capacity of frame members shall be able to develop the moment capacity at the ends of the members. (Tier 2: Sec. 4.4.1.4.6)
C *	NC	N/A	STRONG COLUMN/WEAK BEAM: The sum of the moment capacity of the columns shall be 20 percent greater than that of the beams at frame joints. (Tier 2: Sec. 4.4.1.4.7)
C *	NC	N/A	BEAM BARS: At least two longitudinal top and two longitudinal bottom bars shall extend continuously throughout the length of each frame beam. At least 25 percent of the longitudinal bars provided at the joints for either positive or negative moment shall be continuous throughout the length of the members for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.4.8)
C *	NC	N/A	COLUMN-BAR SPLICES: All column bar lap splice lengths shall be greater than *35db* for Life Safety and *50db* for Immediate Occupancy, and shall be enclosed by ties spaced at or less than 8d,, for Life Safety and Immediate Occupancy. Alternatively, column bars shall be spliced with mechanical couplers with a capacity of at least 1.25 times the nominal yield strength of the spliced bar. (Tier 2: Sec. 4.4.1.4.9)

Supplemental Structural Checklist for Building Type C1: Concrete Moment Frames
BUILDING 93 – POOL STADIUM Sheet 2 of 3

C *	NC	N/A	BEAM-BAR SPLICES: The lap splices or mechanical couplers for longitudinal beam reinforcing shall not be located within $l_b/4$ of the joints and shall not be located in the vicinity of potential plastic hinge locations. (Tier 2: Sec. 4.4.1.4.10)
C *	NC	N/A	COLUMN-TIE SPACING: Frame columns shall have ties spaced at or less than *d/4* for Life Safety and Immediate Occupancy throughout their length and at or less than $8d_b$ for Life Safety and Immediate Occupancy at all potential plastic hinge locations. (Tier 2: Sec. 4.4.1.4.11)
C *	NC	N/A	STIRRUP SPACING: All beams shall have stirrups spaced at or less than *d/2* for Life Safety and Immediate Occupancy throughout their length. At potential plastic hinge locations, stirrups shall be spaced at or less than the minimum of $8d_b$ or *d/4* for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.4.12)
C *	NC	N/A	JOINT REINFORCING: Beam-column joints shall have ties spaced at or less than $8d_b$ for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.4.13)
C	NC	N/A	JOINT ECCENTRICITY: There shall be no eccentricities larger than 20 percent of the smallest column plan dimension between girder and column centerlines. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.4.14)
C	NC	N/A	STIRRUP AND TIE HOOKS: The beam stirrups and column ties shall be anchored into the member cores with hooks of 135° or more. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.1.4.15)
C *	NC	N/A	DEFLECTION COMPATIBILITY: Secondary components shall have the shear capacity to develop the flexural strength of the components for Life Safety and shall meet the requirements of Sections 4.4.1.4.9, 4.4.1.4.10, 4.4.1.4.11, 4.4.1.4.12 and 4.4.1.4.15 for Immediate Occupancy. (Tier 2: Sec. 4.4.1 .6.2)
C	NC	N/A	FLAT SLABS: Flat slabs/plates not part of lateral-force-resisting system shall have continuous bottom steel through the column joints for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1 .6.3)

Supplemental Structural Checklist for Building Type C1: Concrete Moment Frames
BUILDING 93 – POOL STADIUM Sheet 3 of 3

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1 .1)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2:Sec. 4.5.1.8)

Connections

C *	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

* Item not visible during site visit, statement completed based on general knowledge of construction type.

Basic Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 93 – POOL STADIUM Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 93 – POOL STADIUM Sheet 2 of 3

C	NC	N/A	TORSION: The estimated distance between the story center of mass and the story center of rigidity shall be less than 20 percent of the building width in either plan dimension for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.6)
C	NC	N/A	DETERIORATION OF CONCRETE: There shall be no visible deterioration of concrete or reinforcing steel in any of the vertical- or lateral-force-resisting elements. (Tier 2: Sec. 4.3.3.4)
C	NC	N/A	POST-TENSIONING ANCHORS: There shall be no evidence of corrosion or spalling in the vicinity of post-tensioning or end fittings. Coil anchors shall not have been used. (Tier 2: Sec. 4.3.3.5)
C	NC	N/A	CONCRETE WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 1/8 inch for Life Safety and 1/16 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.9)

Lateral-Force-Resisting System

C	NC	N/A	COMPLETE FRAMES: Steel or concrete frames classified as secondary components shall form a complete vertical-load-carrying system. (Tier 2: Sec. 4.4.1.6.1)
C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the concrete shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the greater of 100 psi or 2*sqrt(f'c) for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.1)
C *	NC	N/A	REINFORCING STEEL: The ratio of reinforcing steel area to gross concrete area shall be not less than 0.0015 in the vertical direction and 0.0025 in the horizontal direction for Life Safety and Immediate Occupancy. The spacing of reinforcing steel shall be equal to or less than 18 inches for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.2)

Basic Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 93 – POOL STADIUM Sheet 3 of 3

Connections

C *	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)
C *	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)

* Item not visible during site visit, statement completed based on general knowledge of construction type.

Supplemental Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms

BUILDING 93 – POOL STADIUM Sheet 1 of 2

Lateral-Force-Resisting System

C *	NC	N/A	DEFLECTION COMPATIBILITY: Secondary components shall have the shear capacity to develop the flexural strength of the components for Life Safety and shall meet the requirements of Sections 4.4.1.4.9, 4.4.1.4.10, 4.4.1.4.11, 4.4.1.4.12 and 4.4.1.4.15 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.6.2)
C	NC	N/A	FLAT SLABS: Flat slabs/plates not part of lateral-force-resisting system shall have continuous bottom steel through the column joints for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.6.3)
C	NC	N/A	COUPLING BEAMS: The stirrups in coupling beams over means of egress shall be spaced at or less than d/2 and shall be anchored into the confined core of the beam with hooks of 135° or more for Life Safety. All coupling beams shall comply with the requirements above and shall have the capacity in shear to develop the uplift capacity of the adjacent wall for Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.3)
C	NC	N/A	OVERTURNING: All shear walls shall have aspect ratios less than 4-to-1. Wall piers need not be considered. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.4)
C	NC	N/A	CONFINEMENT REINFORCING: For shear walls with aspect ratios greater than 2-to-1, the boundary elements shall be confined with spirals or ties with spacing less than $8d_b$.This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.5)
C	NC	N/A	REINFORCING AT OPENINGS: There shall be added trim reinforcement around all wall openings with a dimension greater than three times the thickness of the wall. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.6)

Supplemental Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 93 – POOL STADIUM Sheet 2 of 2

C	NC	N/A	WALL THICKNESS: Thickness of bearing walls shall not be less than 1/25 the unsupported height or length, whichever is shorter, nor less than 4 inches. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.7)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.4)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)

Connections

C *	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

* Item not visible during site visit, statement completed based on general knowledge of construction type.

Basic Nonstructural Component Checklist Sheet 1 of 4
BUILDING 93 – POOL STADIUM

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 93 – POOL STADIUM

C	**NC**	**N/A**	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	**NC**	**N/A**	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	**NC**	**N/A**	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	**NC**	**N/A**	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	**NC**	**N/A**	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	**NC**	**N/A**	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	**NC**	**N/A**	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	**NC**	**N/A**	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist Sheet 3 of 4
BUILDING 93 – POOL STADIUM

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 93 – POOL STADIUM

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 93 – POOL STADIUM

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 93 – POOL STADIUM

C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.7.2 BUILDING 105 – LeBARD STADIUM, EAST & WEST PRESS BOXES

Building Description

YEAR OF CONSTRUCTION:	1954 – Stadium and E. Press Box unknown – W. Press Box
YEAR OF ALTERATIONS:	2000 & 2004 – Stadium ADA Upgrades
BUILDING TYPE:	W2, C2 (The east and west press box buildings do not strictly adhere to any of the typical wood building types. The type chosen most closely matches existing building characteristics.)

GENERAL BUILDING DESCRIPTION: The Stadium site consists of bleachers constructed on earthen berms at either side of the playing field. The original structural drawings dated circa 1954 depict one press box on the east side of the stadium atop the east, home-side bleachers. Field observations revealed an additional press box structure atop the west, visitors' bleachers; no structural drawings are available for this building.

For exterior elevations and typical construction of the East Press Box and Bleachers, see pictures Bldg105E-01 to Bldg105E-18. For the West Press Box and Bleachers, see pictures Bldg105W-01 to Bldg105W-12.

BLEACHERS STRUCTURAL SYSTEM: Both bleachers are slab on grade, reinforced concrete construction. Both are approximately 31 feet high and 74 feet deep. The west bleacher is 270 feet wide and the east bleacher is 207 feet wide. A concrete fence wall is located along the top of both bleachers. Concrete retaining walls and ramps were added as part of stadium upgrades in 2000 and 2004. The bleachers are in fair condition with minor to moderate spalling evident throughout.

Note the bleachers are not categorized as a building type and checklists were not completed for them. They were viewed in the field to determine their condition as a part of this evaluation.

EAST PRESS BOX STRUCTURAL SYSTEM: The East Press Box is a one story, wood framed structure. It is 13 feet high, 38 feet long, and 8 feet wide. The lateral force resisting system is a plywood roof diaphragm with plywood shear walls. It is supported by a reinforced concrete podium that is approximately 4 feet high consisting of a concrete slab and concrete walls on continuous conventional footings. The press box framing appears to be in fair condition. The concrete podium is in fair condition with locations of moderate spalling and cracking.

WEST PRESS BOX STRUCTURAL SYSTEM: The West Press Box is a one story, wood framed structure. It is 11 feet high, 24 feet long, and 7 feet wide and supported by the concrete bleacher slab. The lateral force resisting system is a plywood roof diaphragm with one plywood shear wall in each direction. Anchorage to the slab appears to be post-installed. The press box framing appears to be in fair condition.

NON-STRUCTURAL SYSTEMS: The East Press Box contains lights at the roof level which are anchored to guardrails. The West Press Box contains speakers which are minimally anchored to the roof structure (picture Bldg105W-05).

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. EAST & WEST PRESS BOXES, REDUNDANCY: The longitudinal direction only contains one line of plywood shear walls in each press box. The transverse direction only contains one line of plywood shear walls in the west press box only.
2. EAST & WEST PRESS BOXES, OPENINGS: The west wall (East Press Box) and east wall (West Press Box) has windows along entire length, and no wood structural panel shear walls are present for bracing.
3. WEST PRESS BOX, NARROW WOOD SHEAR WALLS & SHEAR OVERSTRESS: The shear wall in the transverse direction has an aspect ratio greater than 2-to-1 and has a shear stress of over 1,000 plf, both maximum limits for Life Safety.
4. CONCRETE BLEACHERS & CONCRETE PODIUM, DETERIORATION OF CONCRETE: Minor to moderate spalling with exposed rebar was typically viewed at the bleacher risers and at the south stairs of the East Press Box concrete podium (pictures Bldg105E-13 to Bldg105E-15).
5. CONCRETE PODIUM, OPENINGS AT SHEAR WALLS: Diaphragm openings in the concrete slab immediately adjacent to the east concrete wall account for approximately 50% of the wall length. Due to the low seismic shear being transferred to this concrete wall, this deficiency appears to be minor (picture Bldg105E-10).

Non-structural

6. EAST & WEST PRESS BOXES, SPEAKERS AT PRESS BOXES NOT ADEQUATELY ANCHORED: Bracing of speakers at the roof consists of wires or cords connected to guardrails or conduit and do not appear to be braced adequately (pictures Bldg105E-18 & Bldg105W-05).

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial

BUILDING 105E – EAST PRESS BOX Sheet 1 of 4

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 105E – EAST PRESS BOX Sheet 2 of 4

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C	NC	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 105E – EAST PRESS BOX Sheet 3 of 4

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2. 7. 7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive tics capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 105E – EAST PRESS BOX Sheet 4 of 4

C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 105E – EAST PRESS BOX Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 105E – EAST PRESS BOX Sheet 2 of 2

C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end distance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

Basic Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 105E – EAST PRESS BOX PODIUM Sheet 1 of 3

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2: Sec. 4.3.1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 105E – EAST PRESS BOX PODIUM Sheet 2 of 3

C	NC	N/A	TORSION: The estimated distance between the story center of mass and the story center of rigidity shall be less than 20 percent of the building width in either plan dimension for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.6)
C	NC	N/A	DETERIORATION OF CONCRETE: There shall be no visible deterioration of concrete or reinforcing steel in any of the vertical- or lateral-force-resisting elements. (Tier 2: Sec. 4.3.3.4)
C	NC	N/A	POST-TENSIONING ANCHORS: There shall be no evidence of corrosion or spalling in the vicinity of post-tensioning or end fittings. Coil anchors shall not have been used. (Tier 2: Sec. 4.3.3.5)
C	NC	N/A	CONCRETE WALL CRACKS: All existing diagonal cracks in wall elements shall be less than 118 inch for Life Safety and 1/16 inch for Immediate Occupancy, shall not be concentrated in one location, and shall not form an X pattern. (Tier 2: Sec. 4.3.3.9)

Lateral-Force-Resisting System

C	NC	N/A	COMPLETE FRAMES: Steel or concrete frames classified as secondary components shall form a complete vertical-load-carrying system. (Tier 2: Sec. 4.4.1.6.1)
C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the concrete shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the greater of 100 psi or 2*sqrt(f'c) for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.1)
C	NC	N/A	REINFORCING STEEL: The ratio of reinforcing steel area to gross concrete area shall be not less than 0.0015 in the vertical direction and 0.0025 in the horizontal direction for Life Safety and Immediate Occupancy. The spacing of reinforcing steel shall be equal to or less than 18 inches for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.2)

Basic Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 105E – EAST PRESS BOX PODIUM Sheet 3 of 3

Connections

C	NC	N/A	TRANSFER TO SHEAR WALLS: Diaphragms shall be connected for transfer of loads to the shear walls for Life Safety and the connections shall be able to develop the lesser of the shear strength of the walls or diaphragms for Immediate Occupancy. (Tier 2: Sec. 4.6.2.1)
C	NC	N/A	FOUNDATION DOWELS: Wall reinforcement shall be doweled into the foundation for Life Safety, and the dowels shall be able to develop the lesser of the strength of the walls or the uplift capacity of the foundation for Immediate Occupancy. (Tier 2: Sec. 4.6.3.5)

Supplemental Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms

BUILDING 105E – EAST PRESS BOX PODIUM Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	DEFLECTION COMPATIBILITY: Secondary components shall have the shear capacity to develop the flexural strength of the components for Life Safety and shall meet the requirements of Sections 4.4.1.4.9, 4.4.1.4.10, 4.4.1.4.11, 4.4.1.4.12 and 4.4.1.4.15 for Immediate Occupancy. (Tier 2: Sec. 4.4.1.6.2)
C	NC	N/A	FLAT SLABS: Flat slabs/plates not part of lateral-force-resisting system shall have continuous bottom steel through the column joints for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.1.6.3)
C	NC	N/A	COUPLING BEAMS: The stirrups in coupling beams over means of egress shall be spaced at or less than d/2 and shall be anchored into the confined core of the beam with hooks of 135° or more for Life Safety. All coupling beams shall comply with the requirements above and shall have the capacity in shear to develop the uplift capacity of the adjacent wall for Immediate Occupancy. (Tier 2: Sec. 4.4.2.2.3)
C	NC	N/A	OVERTURNING: All shear walls shall have aspect ratios less than 4-to-1. Wall piers need not be considered. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.4)
C	NC	N/A	CONFINEMENT REINFORCING: For shear walls with aspect ratios greater than 2-to-1, the boundary elements shall be confined with spirals or ties with spacing less than $8d_b$.This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.5)
C	NC	N/A	REINFORCING AT OPENINGS: There shall be added trim reinforcement around all wall openings with a dimension greater than three times the thickness of the wall. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.6)

Supplemental Structural Checklist for Building Type C2: Concrete Shear Walls with Stiff Diaphragms
BUILDING 105E – EAST PRESS BOX PODIUM Sheet 2 of 2

C	NC	N/A	WALL THICKNESS: Thickness of bearing walls shall not be less than 1/25 the unsupported height or length, whichever is shorter, nor less than 4 inches. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.2.7)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls shall be less than 25 percent of the wall length for Life Safety and 15 percent of the wall length for Immediate Occupancy. (Tier 2: Sec. 4.5.1.4)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)

Connections

C	NC	N/A	UPLIFT AT PILE CAPS: Pile caps shall have top reinforcement and piles shall be anchored to the pile caps for Life Safety, and the pile cap reinforcement and pile anchorage shall be able to develop the tensile capacity of the piles for Immediate Occupancy. (Tier 2: Sec. 4.6.3.10)

Basic Nonstructural Component Checklist
BUILDING 105E – EAST PRESS BOX

Sheet 1 of 4

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 105E – EAST PRESS BOX

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	N/A	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist Sheet 3 of 4
BUILDING 105E – EAST PRESS BOX

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist Sheet 4 of 4
BUILDING 105E – EAST PRESS BOX

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 105E – EAST PRESS BOX

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 105E – EAST PRESS BOX

C	**NC**	**N/A**	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	**NC**	**N/A**	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	**NC**	**N/A**	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	**NC**	**N/A**	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 105W – WEST PRESS BOX Sheet 1 of 4

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 105W – WEST PRESS BOX Sheet 2 of 4

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C	NC	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 105W – WEST PRESS BOX Sheet 3 of 4

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C *	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2. 7. 7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive tics capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C *	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 105W – WEST PRESS BOX Sheet 4 of 4

C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

* Item not visible during site visit, statement completed based on general knowledge of construction type.

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial

BUILDING 105W – WEST PRESS BOX Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C *	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 105W – WEST PRESS BOX Sheet 2 of 2

C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end di stance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

✱ Item not visible during site visit, statement completed based on general knowledge of construction type.

Basic Nonstructural Component Checklist
BUILDING 105W – WEST PRESS BOX

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 105W – WEST PRESS BOX

C	NC	N/A	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	NC	N/A	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	NC	N/A	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	NC	N/A	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	NC	N/A	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	NC	N/A	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	NC	N/A	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist
BUILDING 105W – WEST PRESS BOX

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist
BUILDING 105W – WEST PRESS BOX

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 105W – WEST PRESS BOX

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 105W – WEST PRESS BOX

C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

6.7.3 BUILDING 110 – FIELD HOUSE

Building Description

YEAR OF CONSTRUCTION: 1955
YEAR OF ALTERATIONS: 2007 – Door & Window Additions
BUILDING TYPE: W2

GENERAL BUILDING DESCRIPTION: The Field House was constructed in 1955 per the original structural drawings. It is a one story wood frame building located at the south end of the stadium playing field. It is approximately 12 feet high, 168 feet long and 28 feet wide. The building appears to be in fair condition, although there is general wood deterioration throughout the structure, primarily in exterior locations.

For exterior elevations and typical construction, see pictures Bldg110-01 to Bldg110-12.

VERTICAL STRUCTURAL SYSTEM: The building is typical wood construction with wood stud walls, beams, and posts. The roof is constructed with diagonal sheathing spanning roof rafters supported at stud walls and on an interior steel beam. Steel columns and wood posts support the steel beam. The roof cantilevers out from the exterior walls around the entire building. The foundation is a conventional system; there are continuous footings at stud walls and pad footings at interior columns. The floor is slab on grade on imported fill.

LATERAL STRUCTURAL SYSTEM: The lateral resisting system consists of diagonal sheathing as the roof diaphragm with diagonally sheathed wood shear walls.

NON-STRUCTURAL SYSTEMS: A mechanical unit is supported on the roof with ducts supported from the roof rafters (picture Bldg110-12). No ceiling is present in the building. Light fixtures are directly connected to roof rafters.

For non-structural systems and items present within the building, see pictures Bldg110-13 to Bldg110-18.

List of Deficiencies

The following items have been found noncompliant in accordance with the requirements of ASCE31-03:

Structural

1. DETERIORATION OF WOOD: Signs of moderate decay and splitting is typically visible in the wood members, most notably in exterior locations.
2. DIAPHRAGM SPAN: Diagonally sheathed diaphragm has one horizontal span which is 60 feet, more than the 40 feet limit for Life Safety.

Non-structural

3. TALL NARROW CONTENTS: One cabinet, one refrigerator and multiple storage racks are not anchored to the floor or wall (pictures Bldg110-16 to Bldg110-18).

Additional Observations

Moderate ponding was typically viewed at the roof level.

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 110 – Field House Sheet 1 of 4

Building System

C	NC	N/A	LOAD PATH: The structure shall contain a minimum of one complete load path for Life Safety and Immediate Occupancy for seismic force effects from any horizontal direction that serves to transfer the inertial forces from the mass to the foundation. (Tier 2: Sec. 4.3.1.1)
C	NC	N/A	MEZZANINES: Interior mezzanine levels shall be braced independently from the main structure, or shall be anchored to the lateral-force-resisting elements of the main structure. (Tier 2:Sec. 4.3. 1.3)
C	NC	N/A	WEAK STORY: The strength of the lateral-force-resisting system in any story shall not be less than 80 percent of the strength in an adjacent story, above or below, for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.1)
C	NC	N/A	SOFT STORY: The stiffness of the lateral-force-resisting system in any story shall not be less than 70 percent of the lateral-force-resisting system stiffness in an adjacent story above or below, or less than 80 percent of the average lateral-force-resisting system stiffness of the three stories above or below for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.3.2.2)
C	NC	N/A	GEOMETRY: There shall be no changes in horizontal dimension of the lateral-force-resisting system of more than 30 percent in a story relative to adjacent stories for Life Safety and Immediate Occupancy, excluding one-story penthouses and mezzanines. (Tier 2: Sec. 4.3.2.3)
C	NC	N/A	VERTICAL DISCONTINUITIES: All vertical elements in the lateral-force-resisting system shall be continuous to the foundation. (Tier 2: Sec. 4.3.2.4)
C	NC	N/A	MASS: There shall be no change in effective mass more than 50 percent from one story to the next for Life Safety and Immediate Occupancy. Light roofs, penthouses, and mezzanines need not be considered. (Tier 2: Sec. 4.3.2.5)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 110 – Field House Sheet 2 of 4

C	NC	N/A	DETERIORATION OF WOOD: There shall be no signs of decay, shrinkage, splitting, fire damage, or sagging in any of the wood members, and none of the metal connection hardware shall be deteriorated, broken, or loose. (Tier 2: Sec. 4.3.3. 1)
C	NC	N/A	WOOD STRUCTURAL PANEL SHEAR WALL FASTENERS: There shall be no more than 15 percent of inadequate fastening such as overdriven fasteners, omitted blocking, excessive fastening spacing, or inadequate edge distance. TI1is statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.3.3.2)

Lateral-Force-Resisting System

C	NC	N/A	REDUNDANCY: The number of lines of shear walls in each principal direction shall be greater than or equal to 2 for Life Safety and Immediate Occupancy. (Tier 2: Sec. 4.4.2.1.1)
C	NC	N/A	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 3.5.3.3, shall be less than the following values for Life Safety and Immediate Occupancy (Tier 2: Sec. 4.4.2. 7.1): Structural panel sheathing 1,000 plf Diagonal sheathing 700 plf Straight sheathing 100 plf All other conditions 100 plf
C	NC	N/A	STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings shall not rely on exterior stucco walls as the primary lateral-force-resisting system. (Tier 2: Sec. 4.4.2.7.2)
C	NC	N/A	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard shall not be used as shear walls on buildings over one story in height with the exception of the uppermost level of a multi-story building. (Tier 2: Sec. 4.4.2.7.3)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 110 – Field House Sheet 3 of 4

C	NC	N/A	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 for Life Safety and 1.5-to-1 for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of moderate and high seismicity. Narrow wood shear walls with an aspect ratio greater than 2-to-I for Immediate Occupancy shall not be used to resist lateral forces developed in the building in levels of low seismicity. (Tier 2: Sec. 4.4.2.7.4)
C	NC	N/A	WALLS CONNECTED THROUGH FLOORS: Shear walls shall have interconnection between stories to transfer overturning and shear forces through the floor. (Tier 2: Sec. 4.4.2.7.5)
C	NC	N/A	HILLSIDE SITE: For structures that are taller on at least one side by more than one-half story due to a sloping site, all shear walls on the downhill slope shall have an aspect ratio less than 1-to-1 for Life Safety and 1-to-2 for Immediate Occupancy. (Tier 2: Sec. 4.4.2.7.6)
C	NC	N/A	CRIPPLE WALLS: Cripple walls below first-floor-level shear walls shall be braced to the foundation with wood structural panels. (Tier 2: Sec. 4.4.2.7.7)
C	NC	N/A	OPENINGS: Walls with openings greater than 80 percent of the length shall be braced with wood structural panel shear walls with aspect ratios of not more than 1.5-to-1 or shall be supported by adjacent construction through positive tics capable of transferring the lateral forces. (Tier 2: Sec. 4.4.2.7.8)

Connections

C	NC	N/A	WOOD POSTS: There shall be a positive connection of wood posts to the foundation. (Tier 2: Sec. 4.6.3.3)
C	NC	N/A	WOOD SILLS: All wood sills shall be bolted to the foundation. (Tier 2: Sec. 4.6.3.4)

Basic Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 110 – Field House Sheet 4 of 4

C	NC	N/A	GIRDER/COLUMN CONNECTION: There shall be a positive connection utilizing plates, connection hardware, or straps between the girder and the column support. (Tier 2: Sec. 4.6.4.1)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 110 – Field House Sheet 1 of 2

Lateral-Force-Resisting System

C	NC	N/A	HOLD-DOWN ANCHORS: All shear walls shall have hold-down anchors constructed per acceptable construction practices, attached to the end studs. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.4.2.7.9)

Diaphragms

C	NC	N/A	DIAPHRAGM CONTINUITY: The diaphragms shall not be composed of split-level floors and shall not have expansion joints. (Tier 2: Sec. 4.5.1.1)
C	NC	N/A	ROOF CHORD CONTINUITY: All chord elements shall be continuous, regardless of changes in roof elevation. (Tier 2: Sec. 4.5.1.3)
C	NC	N/A	PLAN IRREGULARITIES: There shall be tensile capacity to develop the strength of the diaphragm at re-entrant comers or other locations of plan irregularities. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.7)
C	NC	N/A	DIAPHRAGM REINFORCEMENT AT OPENINGS: There shall be reinforcing around all diaphragm openings larger than 50 percent of the building width in either major plan dimension. This statement shall apply to the Immediate Occupancy Performance Level only. (Tier 2: Sec. 4.5.1.8)
C	NC	N/A	STRAIGHT SHEATHING: All straight sheathed diaphragms shall have aspect ratios less than 2-to-1 for Life Safety and 1-to-1 for Immediate Occupancy in the direction being considered. (Tier 2: Sec. 4.5.2.1)
C	NC	N/A	SPANS: All wood diaphragms with spans greater than 24 feet for Life Safety and 12 feet for Immediate Occupancy shall consist of wood structural panels or diagonal sheathing. Wood commercial and industrial buildings may have rod-braced systems. (Tier 2: Sec. 4.5.2.2)

Supplemental Structural Checklist for Building Type W2: Wood Frames, Commercial and Industrial
BUILDING 110 – Field House Sheet 2 of 2

C	NC	N/A	UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms shall have horizontal spans less than 40 feet for Life Safety and 30 feet for Immediate Occupancy and shall have aspect ratios less than or equal to 4-to-1 for Life Safety and 3-to-1 for Immediate Occupancy. (Tier 2: Sec. 4.5.2.3)
C	NC	N/A	OTHER DIAPHRAGMS: The diaphragm shall not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Tier 2: Sec. 4.5.7.1)

Connections

C	NC	N/A	WOOD SILL BOLTS: Sill bolts shall be spaced at 6 feet or less for Life Safety and 4 feet or less for Immediate Occupancy, with proper edge and end di stance provided for wood and concrete. (Tier 2: Sec. 4.6.3.9)

Basic Nonstructural Component Checklist Sheet 1 of 4
BUILDING 110 – FIELD HOUSE

Partitions

C	NC	N/A	UNREINFORCED MASONRY: Unreinforced masonry or hollow clay tile partitions shall be braced at a spacing equal to or less than 10 feet in levels of low or moderate seismicity and 6 feet in levels of high seismicity. (Tier 2: Sec. 4.8.1.1)

Ceiling Systems

C	NC	N/A	SUPPORT: The integrated suspended ceiling system shall not be used to laterally support the tops of gypsum board, masonry, or hollow clay tile partitions. Gypsum board partitions need not be evaluated where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier2: Sec. 4.8.2.1)

Light Fixtures

C	NC	N/A	EMERGENCY LIGHTING: Emergency lighting shall be anchored or braced to prevent falling during an earthquake. (Tier 2: Sec. 4.8.3.1)

Cladding and Glazing

C	NC	N/A	CLADDING ANCHORS: Cladding components weighing more than 10 psf shall be mechanically anchored to the exterior wall framing at a spacing equal to or less than 4 feet. A spacing of up to 6 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.1)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.4.2)
C	NC	N/A	CLADDING ISOLATION: For moment frame buildings of steel or concrete, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.3)

Basic Nonstructural Component Checklist Sheet 2 of 4
BUILDING 110 – FIELD HOUSE

C	**NC**	**N/A**	MULTI-STORY PANELS: For multi-story panels attached at each floor level, panel connections shall be detailed to accommodate a story drift ratio of 0.02. Panel connection detailing for a story drift ratio of 0.01 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.4)
C	**NC**	**N/A**	BEARING CONNECTIONS: Where bearing connections are required, there shall be a minimum of two bearing connections for each wall panel. (Tier 2: Sec. 4.8.4.5)
C	**NC**	**N/A**	INSERTS: Where inserts are used in concrete connections, the inserts shall be anchored to reinforcing steel or other positive anchorage. (Tier 2: Sec. 4.8.4.6)
C	**NC**	**N/A**	PANEL CONNECTIONS: Exterior cladding panels shall be anchored out-of-plane with a minimum of 4 connections for each wall panel. Two connections per wall panel are permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.4.7)

Masonry Veneer

C	**NC**	**N/A**	SHELF ANGLES: Masonry veneer shall be supported by shelf angles or other elements at each floor 30 feet or more above ground for Life Safety and at each floor above the first floor for Immediate Occupancy. (Tier 2: Sec. 4.8.5.1)
C	**NC**	**N/A**	TIES: Masonry veneer shall be connected to the back-up with corrosion-resistant ties. The ties shall have a spacing equal to or less than 24 inches with a minimum of one tie for every 2-2/3 square feet. A spacing of up to 36 inches is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.5.2)
C	**NC**	**N/A**	WEAKENED PLANES: Masonry veneer shall be anchored to the back-up adjacent to weakened planes, such as at the locations of flashing. (Tier 2: Sec. 4.8.5.3)
C	**NC**	**N/A**	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the connection elements. (Tier 2: Sec. 4.8.5.4)

Basic Nonstructural Component Checklist
BUILDING 110 – FIELD HOUSE

Sheet 3 of 4

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	URM PARAPETS: There shall be no laterally unsupported unreinforced masonry parapets or cornices with height-to-thickness ratios greater than 1.5. A height-to-thickness ratio of up to 2.5 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.1)
C	NC	N/A	CANOPIES: Canopies located at building exits shall be anchored to the structural framing at a spacing of 6 feet or less. An anchorage spacing of up to 10 feet is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.8.2)

Masonry Chimneys

C	NC	N/A	URM CHIMNEYS: No unreinforced masonry chimney shall extend above the roof surface more than twice the least dimension of the chimney. A height above the roof surface of up to three times the least dimension of the chimney is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.9.1)

Stairs

C	NC	N/A	URM WALLS: Walls around stair enclosures shall not consist of unbraced hollow clay tile or unreinforced masonry with a height-to-thickness ratio greater than 12-to-1. A height-to-thickness ratio of up to 15-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.10.1)
C	NC	N/A	STAIR DETAILS: In moment frame structures, the connection between the stairs and the structure shall not rely on shallow anchors in concrete. Alternatively, the stair details shall be capable of accommodating the drift calculated using the Quick Check procedure of Section 3.5.3.1 without including tension in the anchors. (Tier 2: Sec. 4.8.10.2)

Basic Nonstructural Component Checklist
BUILDING 110 – FIELD HOUSE

Sheet 4 of 4

Building Contents and Furnishing

C	NC	N/A	TALL NARROW CONTENTS: Contents over 4 feet in height with a height-to-depth or height-to-width ratio greater than 3-to-1 shall be anchored to the floor slab or adjacent structural walls. A height-to-depth or height-to-width ratio of up to 4-to-1 is permitted where only the Basic Nonstructural Component Checklist is required by Table 3-2. (Tier 2: Sec. 4.8.11.1)

Mechanical and Electrical Equipment

C	NC	N/A	EMERGENCY POWER: Equipment used as part of an emergency power system shall be mounted to maintain continued operation after an earthquake. (Tier 2: Sec. 4.8.12.1)
C	NC	N/A	HAZARDOUS MATERIAL EQUIPMENT: HVAC or other equipment containing hazardous material shall not have damaged supply lines or unbraced isolation supports. (Tier 2:Sec. 4.8.12.2)
C	NC	N/A	DETERIORATION: There shall be no evidence of deterioration, damage, or corrosion in any of the anchorage or supports of mechanical or electrical equipment. (Tier 2: Sec. 4.8.12.3)
C	NC	N/A	ATTACHED EQUIPMENT: Equipment weighing over 20 lb that is attached to ceilings, walls, or other supports 4 feet above the floor level shall be braced. (Tier 2: Sec. 4.8.12.4)

Piping

C	NC	N/A	FIRE SUPPRESSION PIPING: Fire suppression piping shall be anchored and braced in accordance with NFPA-13 (NFPA, 1996). (Tier 2: Sec. 4.8.13.1)
C	NC	N/A	FLEXIBLE COUPLINGS: Fluid, gas, and fire suppression piping shall have flexible couplings. (Tier 2: Sec. 4.8.13.2)

Hazardous Materials Storage and Distribution

C	NC	N/A	TOXIC SUBSTANCES: Toxic and hazardous substances stored in breakable containers shall be restrained from falling by latched doors, shelf lips, wires, or other methods. (Tier 2: Sec. 4.8.15.1)

Intermediate Nonstructural Component Checklist Sheet 1 of 2
BUILDING 110 – FIELD HOUSE

Ceiling Systems

C	NC	N/A	LAY-IN TILES: Lay-in tiles used in ceiling panels located at exits and corridors shall be secured with clips. (Tier 2: Sec. 4.8.2.2)
C	NC	N/A	INTEGRATED CEILINGS: Integrated suspended ceilings at exits and corridors or weighing more than 2 pounds per square foot shall be laterally restrained with a minimum of four diagonal wires or rigid members attached to the structure above at a spacing equal to or less than 12 feet. (Tier 2: Sec. 4.8.2.3)
C	NC	N/A	SUSPENDED LATH AND PLASTER: Ceilings consisting of suspended lath and plaster or gypsum board shall be attached to resist seismic forces for every 12 square feet of area. (Tier 2: Sec. 4.8.2.4)

Light Fixtures

C	NC	N/A	INDEPENDENT SUPPORT: Light fixtures in suspended grid ceilings shall be supported independently of the ceiling suspension system by a minimum of two wires at diagonally opposite corners of the fixtures. (Tier 2: Sec. 4.8.3.2)

Cladding and Glazing

C	NC	N/A	GLAZING: Glazing in curtain walls and individual panes over 16 square feet in area, located up to a height of 10 feet above an exterior walking surface, shall have safety glazing. Such glazing located over 10 feet above an exterior walking surface shall be laminated annealed or laminated heat-strengthened safety glass or other glazing system that will remain in the frame when glass is cracked. (Tier 2: Sec. 4.8.4.8)

Parapets, Cornices, Ornamentation, and Appendages

C	NC	N/A	CONCRETE PARAPETS: Concrete parapets with height-to-thickness ratios greater than 2.5 shall have vertical reinforcement. (Tier 2: Sec. 4.8.8.3)

Intermediate Nonstructural Component Checklist Sheet 2 of 2
BUILDING 110 – FIELD HOUSE

C	NC	N/A	APPENDAGES: Cornices, parapets, signs, and other appendages that extend above the highest point of anchorage to the structure or cantilever from exterior wall faces and other exterior wall ornamentation shall be reinforced and anchored to the structural system at a spacing equal to or less than 10 feet for Life Safety and 6 feet for Immediate Occupancy. This requirement need not apply to parapets or cornices compliant with Section 4.8.8.1 or 4.8.8.3. (Tier 2: Sec. 4.8.8.4)

Masonry Chimneys

C	NC	N/A	ANCHORAGE: Masonry chimneys shall be anchored at each floor level and the roof. (Tier 2: Sec.4.8.9.2)

Mechanical and Electrical Equipment

C	NC	N/A	VIBRATION ISOLATORS: Equipment mounted on vibration isolators shall be equipped with restraints or snubbers. (Tier 2: Sec. 4.8.12.5)

Ducts

C	NC	N/A	STAIR AND SMOKE DUCTS: Stair pressurization and smoke control ducts shall be braced and shall have flexible connections at seismic joints. (Tier 2: Sec. 4.8.14.1)

7. RECOMMENDATIONS

Recommendations for the buildings included in the evaluation are based on the ASCE 31-03 Tier 1 screening information outlined previously, and are contingent on completion of ASCE 31-03 Tier 2 and ASCE 41-06 Evaluations. These recommendations are intended to summarize potential mitigation schemes for noncompliant items identified in the Tier 1 checklists completed in Section 6. Note that the additional evaluations listed above may indicate additional noncompliant items not included in these report findings.

Generally, non-compliant items noted are correctable and their mitigation appears to be economically feasible.

Priority of Mitigation / Repairs

The following is a prioritized list for structural repairs based on immediate seriousness of the deficiency.

1. Repair or replacement of major damage in the following locations.
   a. Building 9 – Canopy wood support beam at mechanical unit exhibits major deterioration. See Appendix A for location.
   b. Building 13 – Cantilevered canopy wood support purlins exhibit major damage and deterioration. See Appendix A for location.
2. Building 35, deficient steel moment frames along the northeast exterior wall combined with no lateral system along the southwest exterior wall.
3. Retrofit of concrete or masonry wall to wood diaphragm connection using wall anchors. This condition is typical in Buildings 2, 4, 8, 9, 37 and 39.
4. Retrofit of steel moment frame systems. Retrofit may consist of new moment frames, braced frames or wood shear walls as appropriate for the revised building layout. Deficient steel moment frames are present in Buildings 8, 9 and 36. Building 35 also has deficient steel moment frames, and this is addressed in item 2 above.
5. Retrofit of other structural items listed below.
6. Retrofit of non-structural items listed below.

Description of Typical Mitigation / Repair / Retrofit

Typical recommended types of repairs with descriptions are as follows:

REPAIR OF DETERIORATION OR DAMAGE – Deteriorated and damaged wood, masonry or concrete damage will be repaired or replaced using standard construction methods. The

Secretary of the Interior Standards will be used to guide the preservation and repair of defining features.

Damaged wood members would be replaced as required. For concrete repair, damaged and deteriorated concrete will be removed to sound concrete, reinforcing steel cleaned, epoxy dowels added as required, all prior to placement of structural concrete grout repair material.

PROXIMITY OF EXISTING BUILDINGS –

Canopies Supported by Multiple Buildings – In several locations, canopies are supported on walls of adjacent free-standing structures with no seismic joints, which is noncompliant. This occurs at Buildings 7 & 8, 8 & 9, 12 & 13 and 35, 36 & 37. In such instances, new canopy support should be provided parallel to one of the existing building's walls using a parallel steel beam supported on steel tube cantilever columns spaced at 8 feet on center maximum. Cantilever columns will be supported on new concrete footings.

Canopies with Inadequate Seismic Joint – At one canopy between Buildings 2 & 4, the existing seismic joint is noncompliant. For this condition, the existing seismic joint should be increased to conform to current code provisions.

Additions with Noncompliant Seismic Joints – In several instances, previous additions to existing buildings were constructed with connection of the addition diaphragm to the existing structure and with an inadequate seismic joint between existing and added walls. This condition will be investigated further during subsequent evaluations. Mitigation may consist of additional engineering, connection of the two walls, or other methods.

WALL ANCHORAGES AT REINFORCED MASONRY AND CONCRETE WALLS TO WOOD DIAPHRAGMS – Wall anchorage ties to be provided at all reinforced masonry or concrete walls at 4 feet spacing maximum on center. These anchorages typically consist of threaded rods anchored to the wall attached to steel angles, straps or holdowns which attach to the wood roof using solid blocking, lag screws and framing clips. See Appendix B for example details.

ANCHORAGE OF PRECAST WALLS TO FOUNDATION – It does not appear as if anchorage at these locations exists. Mitigation may consist of (A) documentation of existing anchorage at these locations, or (B) providing new anchors at these locations as required by engineering analysis. The new anchors would likely be added by removing existing concrete, installing new reinforcing dowels, and repairing with structural grout. Anchors would likely be at 16 inches on center maximum.

NONCOMPLIANT STEEL MOMENT FRAMES – At locations of noncompliant steel moment frames, provide new steel moment frames, steel braced frames or plywood shear walls along the wall length as required by engineering analysis. See Appendix A and B for additional information.

NONCOMPLIANT STEEL BRACED FRAMES – At locations of noncompliant steel braced frames consisting of tension rod bracing, replace tension rods and connections with code compliant bracing and gusset plates. Additionally, retrofit existing columns, beam and column anchorage as required by engineering analysis. Braces would consist of double angles or similar.

CONTINUITY TIES AT WOOD DIAPHRAGMS – Continuity ties are code required and provide a continuous load path across the diaphragm width. Cross ties consisting of steel straps, angles or channels would be provided at discontinuous steel and wood members at column locations in each direction, or at 24 feet maximum on center spacing. See Appendix B for an example detail.

COLLECTORS AT WOOD DIAPHRAGMS – Collectors, or drag members, are provided to transfer diaphragm loads to lateral force resisting shear walls, moment frames or braced frames. Where collectors are not present, new drag members would be provided. One common type of drag member consists of steel strapping, angles or channels with lag screws at wood rafters or blocking, and adequate anchorage using post-installed anchors, welding or other means to the masonry shear wall or steel frame.

WOOD DIAPHRAGM SPAN – In cases noted, non-compliant diaphragm span lengths will likely be mitigated through engineering and no retrofit of this condition would then be required.

In the case where mitigation through engineering is not possible, which we currently deem unlikely, possible retrofit efforts which would mitigate the condition include (A) addition of new plywood sheathing over existing diagonal or straight sheathing, or (B) addition of nailing at existing plywood sheathing to increase its capacity as required by engineering analysis.

ANCHORAGE OF MECHANICAL EQUIPMENT – Adequate anchorage to the roof structure or concrete slab or pad to be provided. This would likely be accomplished utilizing steel angles, wood blocking, lag screws, and other wood framing and connections at existing wood roof construction. At concrete construction, steel angles with post-installed anchors would likely be used. Anchorages should be located at each unit corner, minimum.

BRACING OF APPENDAGES AND NON-STRUCTURAL ITEMS – Adequate bracing of signs or other appendages to be provided. This type of bracing typically consists of steel, clips, angles or tubes with bolted connections, or other anchorage as required by geometry or material. This type of mitigation would also apply to the Interior Mezzanine Bracing at Building 2.

Anticipated Repairs by Building

1. Buildings 2 & 4
   a. Building 2 – Stage and Auditorium
      STRUCTURAL:
      i. Proximity of adjacent buildings
      ii. Interior mezzanine bracing
      iii. Wall anchorages
      iv. Wood diaphragm cross ties
      v. Wood diaphragm span – this item can likely be mitigated through engineering
      vi. No top reinforcing in 2 pile caps
      NON-STRUCTURAL:
      vii. Ceiling support / lay-in tile clips
      viii. Light fixture support in ceilings
      ix. Equipment anchorage
      x. Anchorage of tall narrow contents
      xi. Flexible pipe couplings / fire suppression bracing
   b. Building 2 - Drama Workshop
      STRUCTURAL:
      i. Proximity of adjacent buildings
      ii. Interior mezzanine bracing
      iii. Wall anchorages
      NON-STRUCTURAL:
      iv. Appendages bracing
      v. Anchorage of tall narrow contents
      vi. Flexible pipe couplings / fire suppression bracing
   c. Building 4 – Music
      STRUCTURAL:
      i. Wall anchorages
      NON-STRUCTURAL:
      ii. Ceiling support / lay-in tile clips
      iii. Light fixture support in ceilings
2. Buildings 7, 8 & 9
   a. Building 7 – Student Success Center
      STRUCTURAL:
      i. Proximity of adjacent buildings

ii. Steel braced frames
iii. Precast wall foundation anchorage

NON-STRUCTURAL:

iv. Equipment anchorage
v. Anchorage of tall narrow contents
vi. Flexible pipe couplings / fire suppression bracing

b. Building 8 – Classrooms and Labs

STRUCTURAL:

i. Deterioration
ii. Proximity of adjacent buildings – canopy attached to more than 1 independent building
iii. Steel braced frames
iv. Steel moment frames
v. Wall anchorage
vi. Precast wall foundation anchorage

NON-STRUCTURAL:

vii. Equipment anchorage
viii. Anchorage of tall narrow contents
ix. Flexible pipe couplings / fire suppression bracing

c. Building 9 – Classrooms and Labs

STRUCTURAL:

i. Deterioration
ii. Proximity of adjacent buildings – canopy attached to more than 1 independent building
iii. Steel moment frames
iv. Wall anchorage
v. Wood diaphragm cross ties
vi. Precast wall foundation anchorage

NON-STRUCTURAL:

vii. Appendages bracing
viii. Equipment anchorage

3. <u>Buildings 12 & 13 – Business Education</u>

a. Building 12 – Business Education

STRUCTURAL:

i. Deterioration
ii. Proximity of adjacent buildings – canopy attached to more than 1 independent building

NON-STRUCTURAL:

iii. Appendages bracing
iv. Equipment anchorage

b. Building 13 – Business Education
   STRUCTURAL:
   i. Deterioration
   ii. Proximity of adjacent buildings – canopy attached to more than 1 independent building
   NON-STRUCTURAL:
   iii. Appendages bracing
   iv. Equipment anchorage
   v. Anchorage of tall narrow contents

4. <u>Buildings 35 to 39</u>
   a. Building 35 - East Math Wing
      STRUCTURAL:
      i. Deterioration
      ii. Proximity of adjacent buildings – canopy attached to more than 1 independent building
      iii. No lateral force resisting system along southwest exterior wall
      iv. Steel moment frames
      v. Wood diaphragm cross ties
      vi. Wood diaphragm span – this item can likely be mitigated through engineering
      NON-STRUCTURAL:
      vii. Light fixture support in ceilings
      viii. Appendages bracing
      ix. Equipment anchorage
      x. Anchorage of tall narrow contents
   b. Building 36 - West Math Wing
      STRUCTURAL:
      i. Proximity of adjacent buildings – canopy attached to more than 1 independent building
      ii. Steel moment frames
      iii. Wood diaphragm cross ties
      iv. Wood diaphragm span – this item can likely be mitigated through engineering
      NON-STRUCTURAL:
      v. Appendages bracing
      vi. Equipment anchorage
   c. Building 37 – Reprographics
      STRUCTURAL:
      i. Deterioration

ii. Proximity of adjacent buildings – canopy attached to more than 1 independent building
iii. Wall anchorage
iv. Wood diaphragm cross ties
v. Wood diaphragm drags
vi. Wood diaphragm span at lower roof

NON-STRUCTURAL:

vii. Ceiling support / lay-in tile clips
viii. Equipment anchorage
ix. Anchorage of tall narrow contents

d. Building 38 - Small Office Addition

STRUCTURAL:

i. No lateral force resisting system along northwest exterior wall

NON-STRUCTURAL:

ii. Equipment anchorage
iii. Anchorage of tall narrow contents

e. Building 39 – Planetarium

STRUCTURAL:

i. Proximity of adjacent buildings
ii. Wall anchorage
iii. Wood diaphragm cross ties

NON-STRUCTURAL:

iv. Equipment anchorage
v. Anchorage of tall narrow contents

5. <u>Buildings 93, 105 & 110</u>

a. Building 93 – Pool Stadium

STRUCTURAL:

i. Deterioration of concrete in pool stadium bleachers
ii. Proximity of adjacent canopy structure
iii. Torsional irregularity - this item can likely be mitigated through engineering

NON-STRUCTURAL:

iv. Equipment anchorage
v. Flexible pipe couplings / fire suppression bracing

b. Building 105 – LeBard Stadium with Press Boxes

STRUCTURAL:

i. Deterioration of concrete in stadium bleachers and East Press Box podium
ii. No lateral force resisting system along East Press Box west edge

iii. Only one wood shear wall is present in each direction in West Press Box. Note that the West Press Box may not be a permitted structure

NON-STRUCTURAL:

iv. Appendages bracing at East and West Press Boxes.

c. Building 110 – Field House

STRUCTURAL:

i. Deterioration of wood in exterior locations
ii. Wood diaphragm span – this item can likely be mitigated through engineering

NON-STRUCTURAL:

iii. Anchorage of tall narrow contents

See the Tier 1 Screening Building Matrix in Section 3 for additional information.

8. CONCLUSION AND LIMITATIONS

We have exercised every effort to observe the visible construction and non-structural components at each building. However, there are items that were not visible or not easily identifiable. Should you or any members of your staff note additional items not listed in this report, please notify us as soon as possible so that it can be observed and documented.

Our professional services have been performed with the intent to meet the degree of care and skill ordinarily exercised by reputable structural engineers practicing in this or similar localities. No other warranty, expressed or implied, is made as to the professional advice or opinions included in this report.

We conducted neither structural analyses beyond what is specified in ASCE 31-03 for Tier 1 screening, nor physical materials testing, to confirm strength or quality of structural materials. These activities are outside the scope and intent of this project. Although limited in scope, our evaluation and this report should be sufficient to provide the information you require and to determine direction for future evaluations, if appropriate.

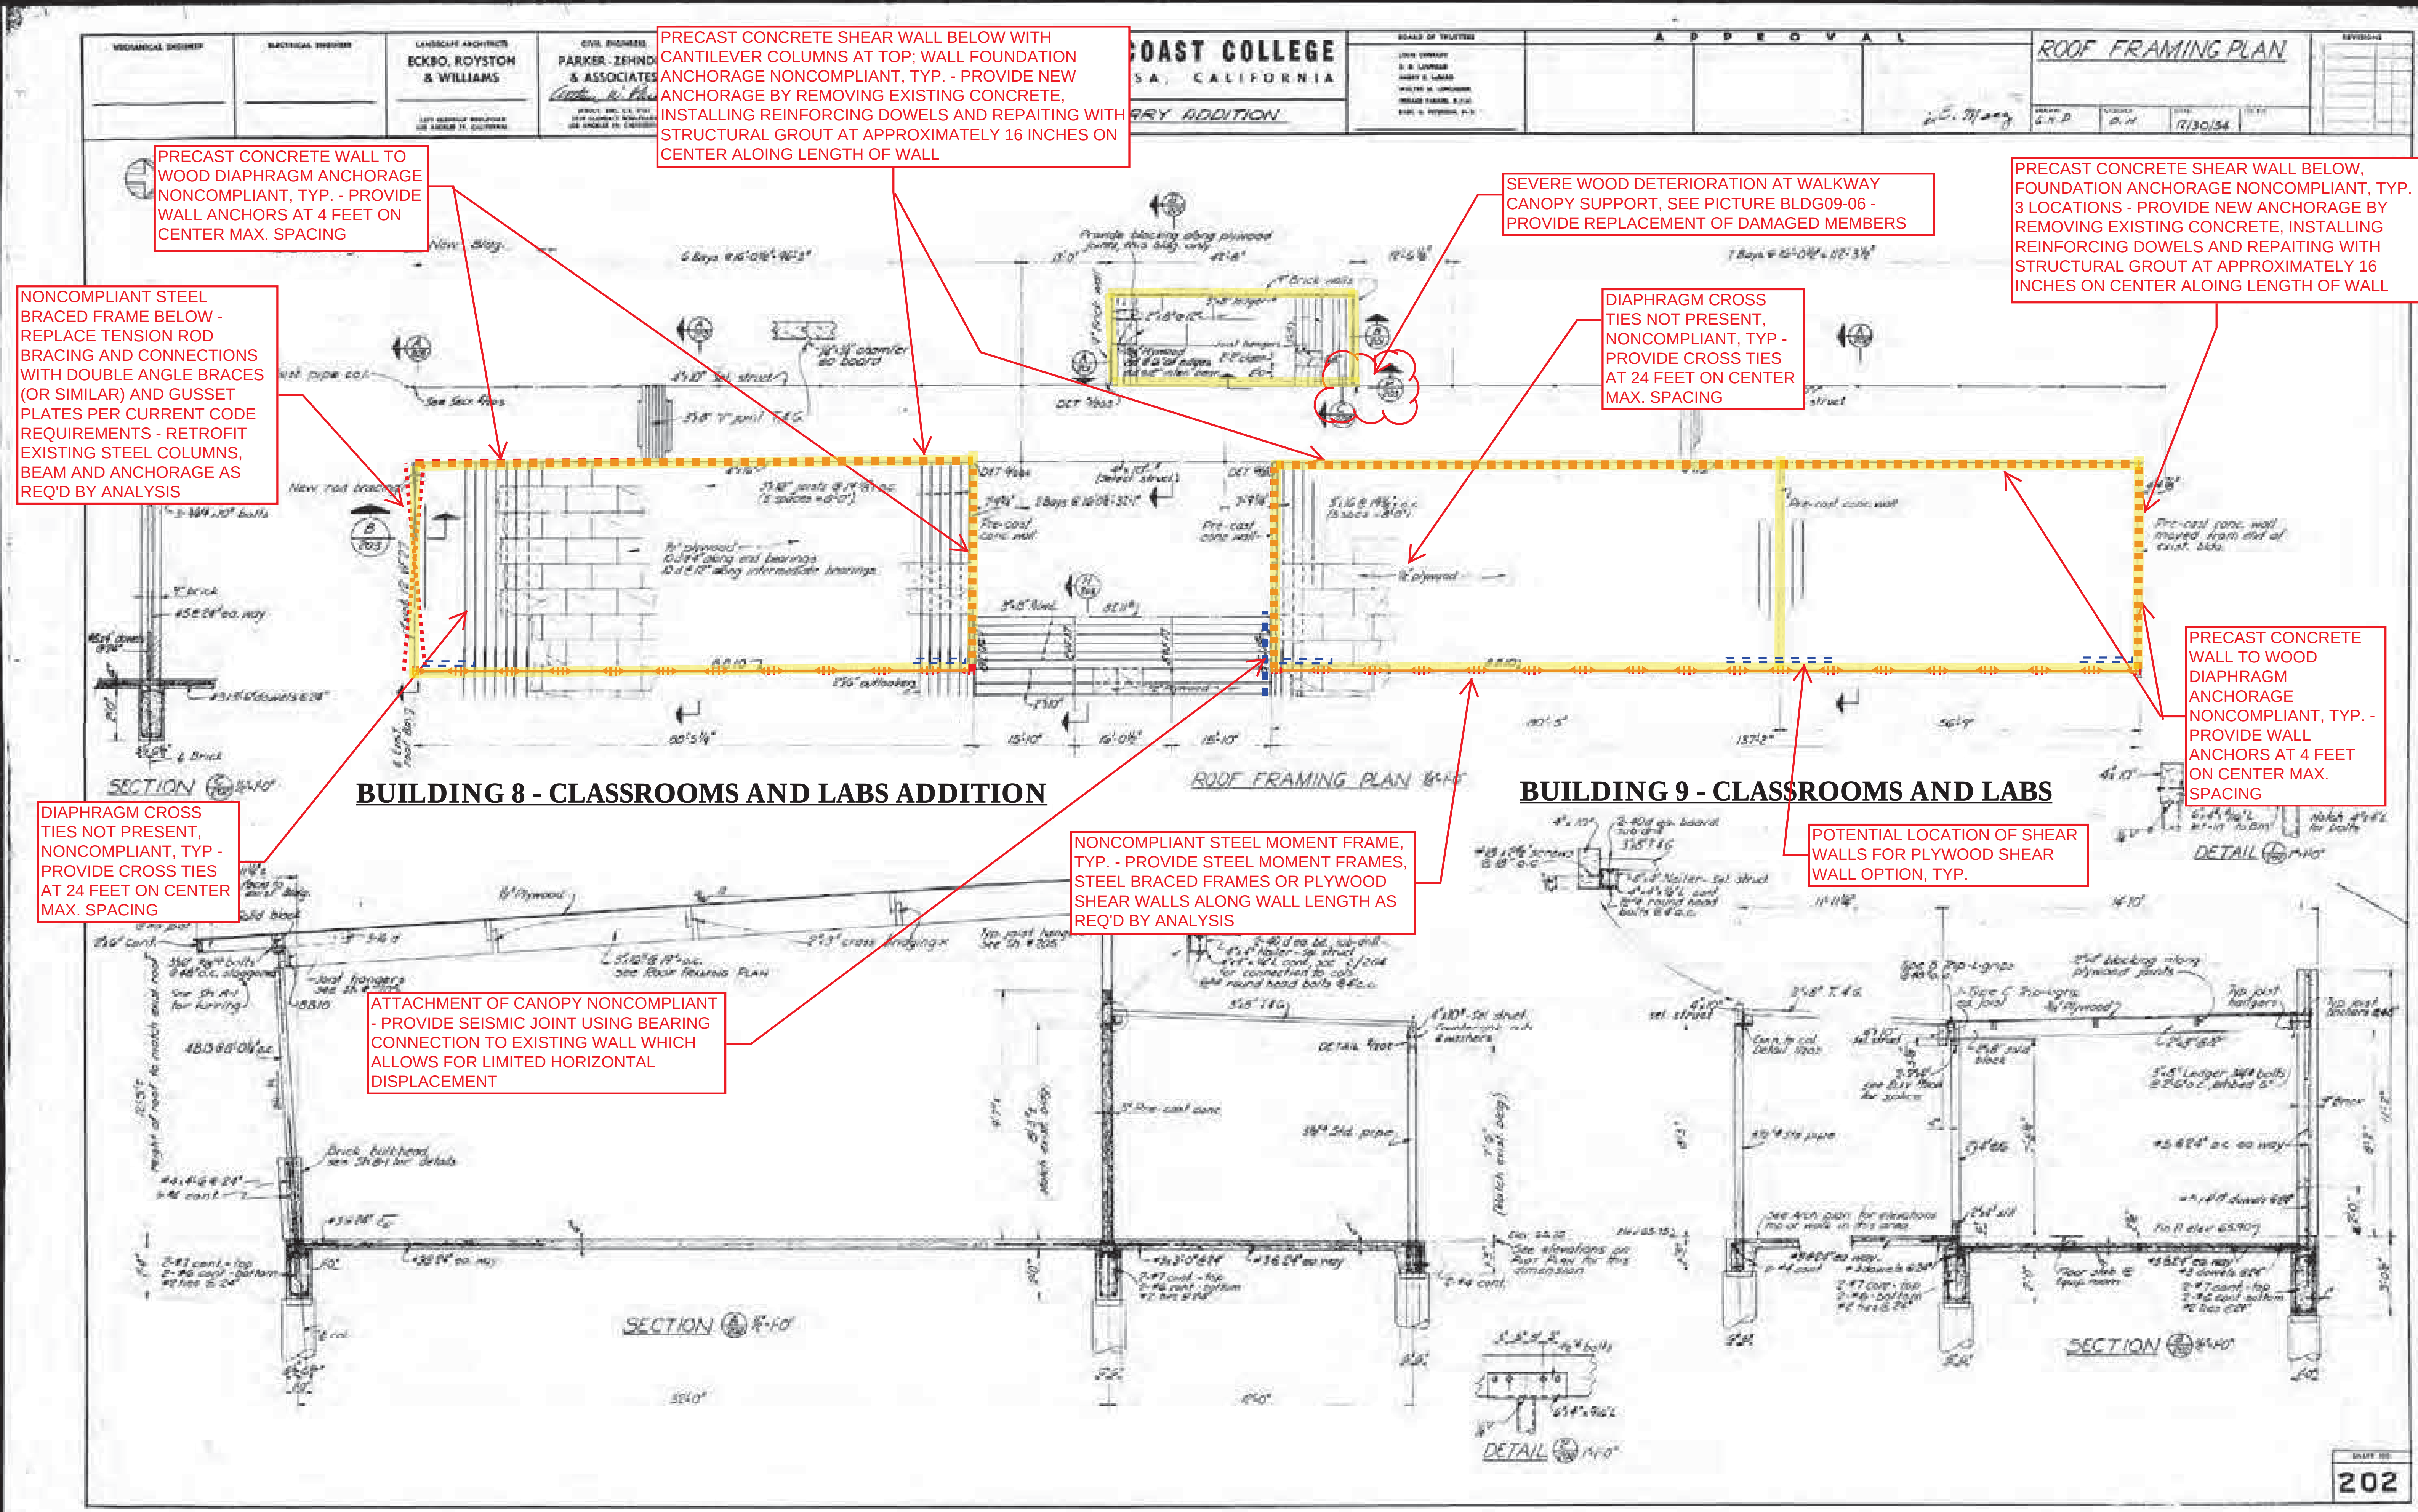
BUILDING 8 - CLASSROOMS AND LABS ADDITION

BUILDING 9 - CLASSROOMS AND LABS



PRECAST CONCRETE SHEAR WALL BELOW WITH CANTILEVER COLUMNS AT TOP; WALL FOUNDATION ANCHORAGE NONCOMPLIANT, TYP. - PROVIDE NEW ANCHORAGE BY REMOVING EXISTING CONCRETE, INSTALLING REINFORCING DOWELS AND REPAITING WITH STRUCTURAL GROUT AT APPROXIMATELY 16 INCHES ON CENTER ALOING LENGTH OF WALL
PRECAST CONCRETE WALL TO WOOD DIAPHRAGM ANCHORAGE NONCOMPLIANT, TYP. - PROVIDE WALL ANCHORS AT 4 FEET ON CENTER MAX. SPACING
NONCOMPLIANT STEEL BRACED FRAME BELOW - REPLACE TENSION ROD BRACING AND CONNECTIONS WITH DOUBLE ANGLE BRACES (OR SIMILAR) AND GUSSET PLATES PER CURRENT CODE REQUIREMENTS - RETROFIT EXISTING STEEL COLUMNS, BEAM AND ANCHORAGE AS REQ'D BY ANALYSIS
SEVERE WOOD DETERIORATION AT WALKWAY CANOPY SUPPORT, SEE PICTURE BLDG09-06 - PROVIDE REPLACEMENT OF DAMAGED MEMBERS
PRECAST CONCRETE SHEAR WALL BELOW, FOUNDATION ANCHORAGE NONCOMPLIANT, TYP. 3 LOCATIONS - PROVIDE NEW ANCHORAGE BY REMOVING EXISTING CONCRETE, INSTALLING REINFORCING DOWELS AND REPAITING WITH STRUCTURAL GROUT AT APPROXIMATELY 16 INCHES ON CENTER ALOING LENGTH OF WALL
DIAPHRAGM CROSS TIES NOT PRESENT, NONCOMPLIANT, TYP - PROVIDE CROSS TIES AT 24 FEET ON CENTER MAX. SPACING
BUILDING 8 - CLASSROOMS AND LABS ADDITION
BUILDING 9 - CLASSROOMS AND LABS
PRECAST CONCRETE WALL TO WOOD DIAPHRAGM ANCHORAGE NONCOMPLIANT, TYP. - PROVIDE WALL ANCHORS AT 4 FEET ON CENTER MAX. SPACING
DIAPHRAGM CROSS TIES NOT PRESENT, NONCOMPLIANT, TYP - PROVIDE CROSS TIES AT 24 FEET ON CENTER MAX. SPACING
NONCOMPLIANT STEEL MOMENT FRAME, TYP. - PROVIDE STEEL MOMENT FRAMES, STEEL BRACED FRAMES OR PLYWOOD SHEAR WALLS ALONG WALL LENGTH AS REQ'D BY ANALYSIS
POTENTIAL LOCATION OF SHEAR WALLS FOR PLYWOOD SHEAR WALL OPTION, TYP.
ATTACHMENT OF CANOPY NONCOMPLIANT - PROVIDE SEISMIC JOINT USING BEARING CONNECTION TO EXISTING WALL WHICH ALLOWS FOR LIMITED HORIZONTAL DISPLACEMENT

APPENDIX B

EXAMPLE DETAILS FOR MITIGATION OF DEFICIENCIES

CONCRETE REPAIR NOTES

A. WORK INCLUDED:

THE WORK AREA INCLUDES CONCRETE COLUMNS, SLABS, BEAMS & WALLS AS IDENTIFIED IN FIELD.

B. TEMPORARY SHORING SYSTEMS:

1. TEMPORARY SHORING SHALL BE INSTALLED PRIOR TO CUTTING AND CHIPPING ANY PORTION OF THE CONCRETE ELEMENTS, AS REQUIRED.

C. DEMOLITION:

1. EXECUTE DEMOLITION WORK TO ENSURE SAFETY OF PERSONS AND ADJACENT PROPERTY AGAINST DAMAGE BY FALLING DEBRIS OR OTHER CAUSES IN CONNECTION WITH THIS WORK. PROTECT FROM DAMAGE ANY OF THE EXISTING BUILDING OR EXISTING PARTS OF WORK TO REMAIN.
2. CUTTING AND DEMOLITION SHALL BE DONE BY METHODS WHICH WILL NOT JEOPARDIZE THE STRUCTURAL INTEGRITY OF THE BUILDING.
3. DO NOT CUT, ABRADE, OR OTHERWISE ALTER ANY STRUCTURAL MEMBER NOT DESIGNATED FOR DEMOLITION.
4. CHIP AWAY DEFECTIVE CONCRETE UNTIL SOUND CONCRETE IS REACHED OVER THE ENTIRE EXTENT OF CHIPPED AREA. THERE SHALL BE A ONE INCH CLEAR SPACE BELOW AND AROUND ANY EXPOSED REINFORCEMENT. WHERE THERE IS NO REINFORCEMENT, THE DEPTH OF THE CAVITY SHALL BE AT LEAST 1.5 INCHES. CHIP AWAY THE CONCRETE AT BOUNDARY EDGES OF THE PATCH AREA TO PROVIDE A MINIMUM DEPTH OF 1 INCH, MEASURED FROM THE FINISHED CONCRETE SURFACE.
5. CHIPPING, HAMMERING AND OTHER DEMOLITION PROCEDURES SHALL NOT DAMAGE EXISTING REINFORCING. EXISTING REINFORCING SHALL NOT BE CUT, BENT, KINKED, NICKED, REMOVED OR DAMAGED IN ANY WAY UNLESS IT IS TO BE REMOVED AND REPLACED.
6. REMOVE ALL CONCRETE ADHERING TO REINFORCING EXPOSED BY DEMOLITION. REMOVE CHAIRS WIRED TO REINFORCING OR OTHER LOOSE FIXTURES NOT REQUIRED FOR SUPPORT OF REINFORCING. REMOVE ALL DETERIORATED REBAR PER GENERAL NOTES AND REPAIR DETAILS.
7. ANY LARGE CRACKING AND/ OR DEEP VOIDS IN THE CONCRETE UNCOVERED DURING THE CHIPPING SHALL BE BROUGHT TO THE IMMEDIATE ATTENTION OF THE STRUCTURAL ENGINEER. BEFORE PROCEEDING WITH WORK IN THIS AREA.

D. RUSTED REINFORCING STEEL:

1. ELIMINATE ALL CORRODED MATERIAL FROM EXISTING REINFORCEMENT UNTIL SOUND METAL IS EXPOSED. REMOVE THE CONCRETE COVER A MINIMUM OF 2 INCHES INTO "NON-RUSTED", SOUND REINFORCING STEEL AND SCRAPE OFF THE RUST WITH A WIRE BRUSH OR OTHER APPROVED MECHANICAL DEVICE.
2. REMOVE AND REPLACE ALL RUSTED REINFORCING STEEL WHEN THE CROSS-SECTION IS LESS THAN 90% OF THE ORIGINAL CROSS-SECTION AND/OR AS DIRECTED BY THE STRUCTURAL ENGINEER.
3. REPLACE REMOVED REINFORCING STEEL WITH BARS OF EQUIVALENT SIZE OR AREA, AND LAP SPLICE TO EXISTING UNRUSTED REINFORCING BARS AS INDICATED ON THE DRAWINGS. IF THE REMAINING EXPOSED LENGTH OF SOUND REINFORCING STEEL IS LESS THAN THE REQUIRED LAP LENGTH FOR THE BAR SIZE, SPLICE NEW BAR TO EXISTING BAR BY MECHANICAL COUPLER DEVICE. WELDING OF REINFORCING STEEL IS NOT PERMITTED.
4. THE STRUCTURAL ENGINEER SHALL BE NOTIFIED IMMEDIATELY OF ANY REINFORCEMENT THAT IS LESS THAN 90% OF THE CROSS-SECTION THAT HAS NOT BEEN SPECIFICALLY DESIGNATED FOR REMOVAL AND REPLACEMENT.
5. COAT ALL EXPOSED OR REPLACED REINFORCING BARS WITH SIKA ARMATEC 110, AS MANUFACTURED BY SIKA CORPORATION, LYNDHURST, N.J.

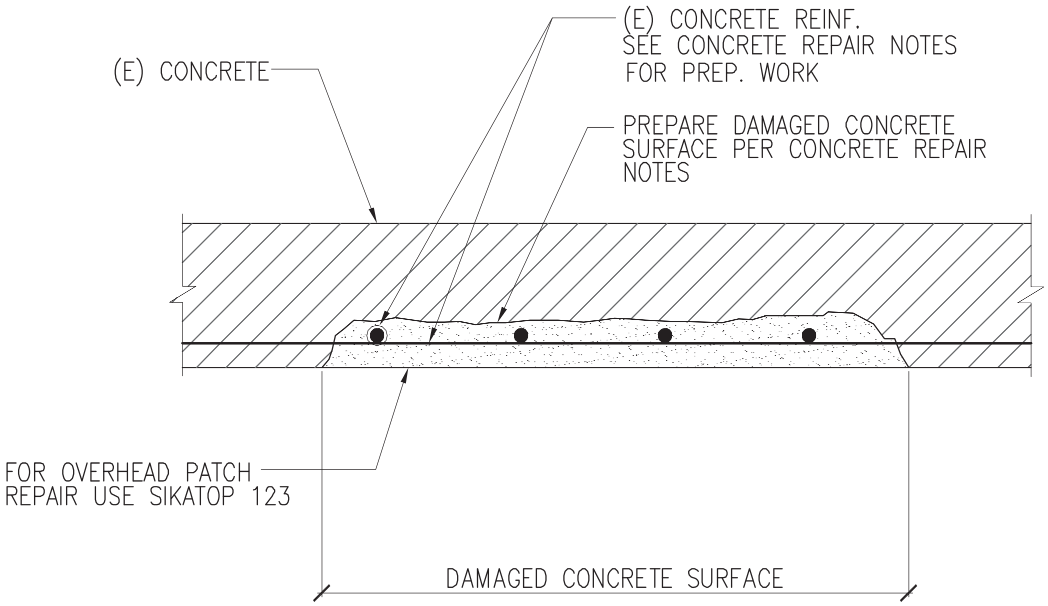
E. SURFACE PREPARATION FOR PATCHING DAMAGED AREAS:

1. THE SURFACE MUST BE MECHANICALLY PREPARED. AREAS TO BE PATCHED MUST BE CLEAN AND SOUND WITH ALL LOOSE AND DETERIORATED CONCRETE REMOVED. ALL LOOSE AND DETERIORATED CONCRETE SHALL BE REMOVED BY MECHANICAL MEANS. SAW CUT PERIMETER OF THE REPAIR AREA ½ INCH OR AS PERMITTED BY THE DEPTH OF THE REINFORCEMENT. CHIP CONCRETE SUBSTRATE TO OBTAIN A GOOD FRACTURED AGGREGATE SURFACE.
2. CHISEL OUT CONCRETE A MINIMUM OF 1 INCH BEYOND THE DEPTH OF THE BAR TO EXPOSE REINFORCING STEEL 360 DEGREES AROUND. ALL REINFORCEMENT SHALL BE EXPOSED A MINIMUM OF 2 INCHES INTO UN-CORRODED METAL.
3. ALL CORRODED MATERIAL SHOULD BE ELIMINATED FROM EXISTING REINFORCEMENT UNTIL SOUND METAL IS EXPOSED.
4. ALL SURFACES SHALL BE FREE OF DIRT, LAITANCE, CORROSION, OR OTHER CONTAMINATION. RINSE SURFACES WITH WATER AND LEAVE SURFACES IN DRY CONDITION PRIOR TO COMMENCING PATCHING PROCEDURES. CONTAIN WATER RUNOFF AND REMOVE ANY STANDING WATER RESULTING FROM THIS WORK.

F. PATCHING DAMAGED AREAS - AFTER COMPLETION OF SURFACE PREPARATION:

1. COAT ALL EXPOSED REINFORCEMENT AND PREPARED CONCRETE SURFACES WITH SIKA ARMATEC 110 (ANTI-CORROSION, BONDING BRIDGE) USING A STIFF-BRISTLE BRUSH OR HOPPER TYPE SPRAY PISTOL.
2. PATCH PARTIAL DEPTH CONCRETE DAMAGE WITH SIKATOP 123 (HAND APPLICATION) OR SIKATOP 111 (FORM, POUR OR PUMP) MORTARS WITHIN 24 HOURS AFTER APPLYING SIKA ARMATEC 110 COATING.
3. FOR HAND APPLIED MORTAR APPLY SIKATOP 123 IN LIFTS NOT TO EXCEED 1 ½ INCHES, SCORING THE TOP SURFACE OF EACH LIFT TO PRODUCE A ROUGHENED SURFACE FOR THE NEXT LIFT. ALLOW PRECEDING LIFTS TO REACH FINAL SET BEFORE APPLYING THE NEXT.
4. PATCH FULL DEPTH CONCRETE DAMAGE WITH TYPE "A" NORMAL WEIGHT CONCRETE, (SEE ABOVE). PLACE CONCRETE IN ACCORDANCE WITH ACI 301 AND ASTM C94.
5. USE INTERNAL VIBRATORS FOR THOROUGH CONSOLIDATION OF ALL CONCRETE. CONFORM TO THE RECOMMENDATIONS OF ACI 309.
6. PROTECT FRESHLY PLACED CONCRETE FROM PREMATURE DRYING, EXCESSIVE COLD OR HOT TEMPERATURES, AND MECHANICAL INJURY. CONFORM TO THE RECOMMENDATIONS OF ACI 308.

EXAMPLE CONCRETE REPAIR NOTES



PARTIAL DEPTH REPAIRS NOTES:

1. CONTRACTOR TO COORDINATE AND FIELD VERIFY DAMAGED COLUMN, SLAB, BEAM & WALL LOCATIONS.
2. CONTRACTOR TO PREP. REINFORCING AND CONCRETE SURFACES PER CONCRETE REPAIR NOTES.

DWE Project #14-411

MECHANICAL : ELECTRICAL : PLUMBING : ENERGY

Table of Contents

Project Overview

The purpose of this report is to describe and evaluate the existing mechanical, plumbing and electrical system for the Orange Coast College Buildings 2 and 4 , 8 & 9,12 & 13 ,35-39,93,105 and 110 to be included in the overall Historic Structure Report.

Faculty from Design West Engineering completed a survey of the buildings and collected equipment information on the existing systems based on visible name plate information and visual inspections. Field investigations were performed on January 13 and 14, 2015.

The evaluation will focus primarily on the electrical power systems, plumbing systems, and the Heating Ventilation and Air Conditioning (HVAC) systems. Other building systems will be analyzed and incorporated into the overall Historic Structure Report. The report will describe where certain assumptions have been made, so that if additional information becomes available, the data can be re-incorporated to achieve the most accurate results possible. The salient features of the evaluation are to the type of electrical, mechanical and plumbing equipment, the age of each major system component, the current health of that component and scheduled replacement or upgrades of the system and its major components along with recommendations for the future use of the buildings.

Mechanical Overview

Buildings 2 and 4

Building 2 – Theater

Building 2 has a mixture of HVAC equipment that serves the building. There is equipment located within a mezzanine that is accessed from the back of the stage and equipment on the roof. The equipment within the mezzanine appears to serve the main Auditorium and is a hydronic heating and cooling system. The mezzanine contains a boiler, hydronic heating pumps and two custom air handlers. The roof has a single multizone AHU, three Carrier DX heat pump units.

- The hydronic hot water boiler is a Lochinvar Copper Fin II, 1,440,000 BTU/H input with a 1 HP Bell & Grossest base mounted pump system circulation pump and two ½ hp boiler circulation pumps. During the time of the inspection, this equipment was not in operation, but the equipment appears to be in fair condition based on visual inspection.
- The custom 4-Pipe air handlers are Temptrol DH35PL 15 HP supply fan and a Temptrol DH17PL 7.5 HP supply fan. Chilled water is feed from a Trane chiller that is located within Building 3 (Music Building). During the time of the inspection, this equipment was not in operation, but the equipment appears to be in fair condition based on visual inspection.

Lochinvar Boiler within Mezzaine

Custom Air Handler within Mezzaine

- The multizone unit is a 4-Pipe Carrier 39TH39KA----QH7-B unit that receives its hot water from the boiler within the mezzanine and chilled water from the chiller within Building 3 (Music Building). This unit serves the area behind the stage, most likely the drama room and associated offices. To the south of the unit, the roof is not sloped correctly to the roof drain and there is standing water. Based on visual inspection, this unit has served beyond its useful life. The pipe insulation serving the unit is falling off is some areas, control valves appear to be old and show signs of rust, the ductwork on the roof appears to be in decent shape.

Multizone AHU on roof

Standing water next to Multizone Unit

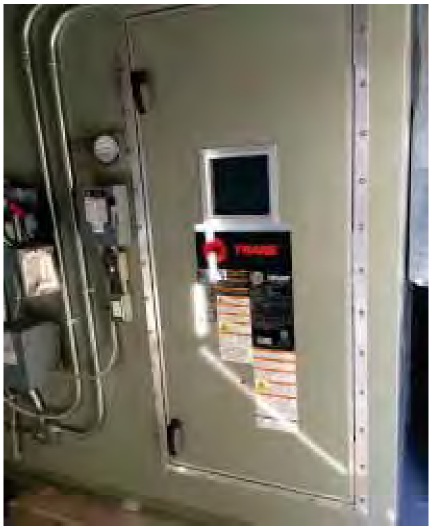
- The workshop room is served via a DX rooftop packaged unit, Carrier 50HJQ009---601. The unit is in fair condition, the coils are beginning to show signs of corrosion. The unit is approximately half way thru its useful life and should have another 5-10 years of service life.
- The costume workshop room is served via a DX rooftop packaged unit, Carrier 50HJQ007---521. The unit is in fair condition, the coils are beginning to show signs of corrosion. The unit is approximately half way thru its useful life and should have another 5-10 years of service life. The ductwork on the roof is in good condition
- The low roof next to the workshop room is served via a DX rooftop packaged unit, Carrier Unit, could not read label, and appears to be a 3 ton unit. The unit is in fair condition.

Typical DX Rooftop Packaged Unit

Building 3 – Music Building

Building 3 has a new HVAC system that was installed within the past year except for the cooling tower. The Air Handler is a Trane TCPAIB021V2M1022FD 7.5 HP VFD motor. The chiller is a Trane RTWD 150F with two 10 HP Taco base mounted end suction pumps. The boiler is a Lochnivar CHN0991 with a Taco 1935C1E1 circulation pump. The cooling tower is a RSD-15 3 HP pump fiberglass style tower. The cooling tower is in fair condition and does not appear to be a newly installed piece of equipment.

- The chiller within this building serves the Music Building and the Theater building. The boiler within this building only serves the Music Building



Trane AHU

Trane Chiller

Building 4 – Music Wing

Building 4 has a new HVAC system that was installed within the past year and is in good condition. The chiller is an air cooled Trane CGAM 080F with two 7.5 HP Taco base mounted end suction pumps. The boiler is a Lochnivar CHN401 with a Taco 1/3 hp circulation pump and 1.5 hp base mounted end suction system pump.

Trane Air cooled chiller

Boiler piping and equipment

4-Pipe Fan Coil

Buildings 7, 8 & 9

Building 7 – Student Success Center

Building 7 has a dedicated chiller, tower, boiler and Multizone AHU unit. The equipment within this building appears be old and past its life expectancy for the equipment.

- The hydronic hot water boiler is a Raypak Boiler, 546,000 BTU/H input with a 2 HP base mounted pump system circulation pump. Boiler is in fair condition
- The Air Handler is a custom 4-Pipe Multizone Trane Climate Changer.
- The chiller is a Trane CG-60D 60 ton chiller, with a 10 HP base mounted end suction pump. The pipe insulation has a lot of repair tape over the existing insulation and shows signs of leaking water.
- The cooling tower is a RSD-070 fiberglass cooling tower with a 1.5 hp fan motor.
- The building also has ceiling mounted fan coils that are tied to the chiller and boiler that are in Fair to good condition
- The building has an old Honeywell EMS system that should be replaced and updated with a newer current DDC system.

Raypak Boiler

Multizone AHU

Trane water cooled chiller, showing pipe insulation

Fiberglass cooling tower

Building 8 – Classroom and Lab

Building 8 has ductless split systems that serve the office area and Rooftop gas units (RTU) that serve the classrooms. There is one RTU per classroom.

- The ductless split systems consist of a wall mounted fan coil located within each office. The condensing unit is located on the roof. The systems appear to be in fair condition and are about half way thru the life expectancy of the equipment
- The RTU units for the classrooms are located above the walkway foyer and are side discharge ductwork within the classroom. The RTU's range from 3 – 5 ton units and are in Fair condition.

Building 9 – Classroom

Building 9 is similar to building 8 classrooms with Rooftop gas units (RTU) that serve the classrooms. There is one RTU per classroom. The units are in Fair condition.

Ductless wall mounted Fan Coil

Ductwork within the classroom

Buildings 12 & 13 Business Education Wing

Buildings 12 and 13 are classroom buildings that are served by a roof top package unit, one per classroom.

- The RTU units for the classrooms are Carrier Gas Electric units located above the walkway foyer and are side discharge ductwork within the classroom. The RTU's range from 3 – 5 ton units and are in Fair condition. The unit is approximately half way thru its useful life and should have another 5-10 years of service life. The units were manufactured in late 2007.
- The units are tied to an Alerton EMS DDC control system.

Typical Classroom RTU

Buildings 35-39

Buildings 35 thru 38 are classroom buildings that are served by a roof top package unit, one per classroom.

- The RTU units for the classrooms are Carrier Gas Electric units located above the walkway foyer and are side discharge ductwork within the classroom. The RTU's range from 2 – 6 ton units and are in Fair condition. The unit is approximately half way thru its useful life and should have another 5-10 years of service life. The units were manufactured in late 2007.
- Exterior Ductwork is damaged on some of the units due to people walking on the ductwork.
- The units are tied to an Alerton EMS DDC control system.

Building 37 – Reprographics

Building 37 has roof top package units located in various locations for the building. There are units located on the foyer of the building along with units that are located on the high roof within a parapet.

- Above the foyer near building 37 around the HVAC units, there is standing water due to very poor roof drainage.
- Building 37 has roof mounted exhaust fans for the classrooms labs. The fans appear to be in fair condition.
- The units on the low roof are Carrier Gas Electric units with side discharge ductwork within the classroom. The RTU's range from 2 – 6 ton units and are in Fair condition. The

unit is approximately half way thru its useful life and should have another 5-10 years of service life. The units were manufactured in late 2007.

- The units located on the high roof Gas Electric units that range from 2-5 ton units and are in old condition. The units have exceeded the useful life expectancy for this equipment and should be changed out.

Building 38 – Science Office Annex

Building 38 has three ductless split systems consist of a wall mounted fan coil located within each office and a condensing unit located on the roof. The systems appear to be in fair condition and are about half way thru the life expectancy of the equipment.

Building 39 – Planetarium

Building 39 has a single Rooftop gas unit (RTU) that is old and exceeded its useful life. This unit should be replaced or removed with the building.

Typical Classroom RTU

View of standing water next to HVAC unit

Damaged Ductwork from RTU within building 37

Buildings 93, 105 and 110

Building 93 – Pool Stadium

The pool has a new Lochinvar Copper Fin 2 CPN2072, 1,999,999 BTU/H with a ¾ hp Armstrong pump.

Building 105 & 110 –Stadium and Field House

The Field House is served via a Trane WCC060F100BE 5 Ton heat pump unit. The unit is in poor condition, coil fins are flaking off. The boiler for the showers has been abandoned. The roof mounted exhaust fans for the restrooms are in fair condition.

DX Heat Pump Unit

Exhaust Fans from Restrooms

Plumbing Overview

Plumbing

The plumbing fixtures for the site are very typical and are in fair to good condition. The water closets and urinals are manual operated flush valve fixtures, lavatories were typically wall mounted cold water only fixtures. Unless otherwise noted.

Buildings 2 and 4

- The restrooms were in good condition, fixtures appear to be replaced within the last 5 years.
- The standing water next to the Multizone unit should be fixed. It appears the roofing material is not slopped correctly to the roof drain which is causing the water to pond up. The standing water could potentially cause damage to the building.

Buildings 7, 8 & 9

- The restrooms in this area were in fair condition, the fixtures are starting to shows signs of extended use. No major defects or leaks were visible from the fixtures.

Buildings 12 & 13

- The restrooms in this area were in fair condition, the fixtures are starting to shows signs of extended use. No major defects or leaks were visible from the fixtures.

Buildings 35-39

- There is standing water above the foyer next to the HVAC equipment. Additional roof drains should be added to mitigate the standing water. The standing water creates a hazard for the maintenance staff as well as damages the building.

Buildings 93, 105 and 110

- The field house restrooms are cold water only and are in fair condition. The fixtures are starting to shows signs of extended use. No major defects or leaks were visible from the fixtures.
- Hot water for the restrooms is from a 100 Gallon Gas fired water heater. American CG32100T774NOV, 75,000 BTU/H input rating. The water heater is in fair condition.

Electrical Overview

A 4160V 3 phase electrical service feeds the majority of the campus. 4160V is distributed throughout to various step down transformers and unit substations.

Buildings 2 and 4

The electrical system for building 2, 3 and 4 are derived from a 4160V feed with the switchgear and 4160V transformers located in an electrical yard and electrical equipment room between buildings 2 and 4. The switchgear and transformers for building 4 were recently installed and are in good working condition. The switchgear MS1 and MS2 feeding building 2 are older but appear to be in good working condition. The lighting in building 2 is working condition, however, the older incandescent lighting could be replaced with more efficient fluorescent or LED lighting. There are some older subpanels in building 2 that should be replaced. Equipment of this age is subject to reliability issues and may also present obsolescence issues for obtaining replacement parts. Continued use of this equipment is likely to result in issues with reliability resulting from age related failures. Building 4 was recently remodeled in 2012 and all electrical equipment and lighting was found to be in good condition.

Building 2 – Theater

The electrical system is fed from two 4160 volt transformers, T24 and T24A, located in an electrical yard east of the auditorium. The first transformer T24 is a 500 KVA transformer that delivers 800 amps of 277/480 volt, 3 phase 4 wire power to switchboard ‘MS1’. The second transformer T24A is a 300 KVA transformer that provides 1200 amps of 120/208 volt, 3-phase, 4-wire power to switchboard ‘MS2’. The transformers and switchboards appear to be in good working condition. There are several subpanels throughout the building which appear to be original to the building and are recommended to be replaced. There are multiple subpanels that are not labeled. Cabling has been abandoned in place and left in some of the older boxes. Several boxes have had covers removed and have not been replaced.

General lighting consists of primarily T-8 strip fluorescents in support rooms and incandescent downlights in the dressing rooms. The theater lighting system consists of incandescent lighting controlled by a theatrical dimming system consisting of 600 amp, 240 volt Power Control Systems dimmer racks. The building is equipped with a central battery emergency lighting system that provides emergency egress lighting and also serves illuminated exit signs. Low and high level exit signs are installed throughout and are in good working condition.

4160V Transformer T-24

4160V Transformer T-24A

Switchboard MS2

Switchboard MS1

Existing unlabled panel that should be replaced

Existing unlabled panel and unsupported cabling

Existing unlabled panel that should be replaced

Existing dimmer racks

Building 4 – Music Wing

Building 4 was recently remodeled in 2012. The electrical system feed starts at a newly installed 4160 volt transformer TVHM, located in an exterior electrical yard between building 2 and 4. The transformer TVHM is a 1000 KVA and delivers 1200 amps of 277/480 volt, 3 phase 4 wire power to switchboard ‘STH’. From there, an 800A 480V feed is routed to distribution switchboard ‘DSMH’ located in Building 3 electrical room, which feeds an 800A 20/208 volt, 3-phase, 4-wire switchboard ‘DSML’ through a 225kVA transformer. These switchboards feed panels H1, L1A, L1B and L1C all located in the Building 4 electrical room. The transformers, switchboards and panelboards have been recently installed and are in good working condition.

General lighting primarily consists of T-8 recessed fluorescent 2x4 and 4’ linear. Select fixtures are provided with battery packs to supply emergency egress lighting. Exit signs with integral backup battery packs are installed throughout and are in good working condition. All rooms have occupancy sensor lighting controls.

It should be noted that any demolition should consider the interconnection of the electrical distribution systems between buildings 2, 3 and 4. At a minimum, both electrical yards between buildings 2 and 4 would need to be protected in place as they are the central power supply for all 3 buildings.

Exterior electrical yard between buildings 2 and 4 – 5kV switch, Transf. TVHM and Swbd STH

Buildings 7, 8 & 9

The electrical system for both buildings 7 and 8 are located within building 7. Building 9 is fed from a separate 4160 volt feed. The electrical switchgear is aged but appears to be in good working condition at building 7. There are older panelboards within the classrooms that are beyond their useful life expectancy and should be replaced. Lighting is primarily T-8 fluorescent. There is abandoned 4160V equipment that should be removed. The buildings are equipped with wall mounted emergency battery lighting units and have some illuminated exit signs.

Building 7 – Student Success Center

Buildings 7 and 8 are fed from two 5 KV switches providing 4160 volts to two transformers. The first is a 150 KVA transformer that delivers 480 volt, 3-phase, 3-wire power to the motor control center, which primarily feed the HVAC equipment. The second is a 300 KVA transformer that provides 800 amps of 120/208 volt, 3-phase, 4-wire power to local distribution. There are some older Zinsco panelboards that are original to the building and should be replaced, along with newer load centers that could be reused. The existing motor control center consists of fuses and HOA controls which have most likely been bypassed with the installation of the EMS. There are abandoned 4160V switches with exposed cabling that has been cut that should be removed.

Lighting is primarily T-8 fluorescent using a EMS system by Edward's Tech with occupancy sensors, timers and typical switches and outlets. The building is equipped with wall mounted emergency battery lighting units. The building has illuminated exit signs. There is a water heater that is in the clearance of the existing 800A distribution panel, which is a code violation. No mechanical ventilation was found in the transformer room at the north side of the building.

Building 7 Electrical Room – Water heater to left in front of Swbd

Abandoned 4160V equipment with exposed cables

Existing Motor Control Center

Existing tranformer room without ventilation

Building 8 – Classroom and Lab

The electrical system is fed from Building 7 providing 400 amps of 120/208 volt, 3-phase, 4-wire power. There are some older Zinsco panelboards that are original to the building and should be replaced, along with newer load centers that could be reused.

Lighting is primarily T-8 fluorescent using an Edward's EMS system with occupancy sensors in some locations with typical switches and outlets. The building has a limited amount of emergency lighting or illuminated exit signs. This building does not have a noted emergency generator.

Existing Zinsco Panelboard Original to Building

Building 9 – Classroom

The electrical system is fed from a 5 KV switch providing 4160 volt power to a 500 KVA transformer that delivers 1600 amps of 120/208 volt, 3-phase, 4-wire power to Distribution Board DPS. The switchgear appears to have been recently installed and is in good working condition. There are some older Zinsco panelboards that are original to the building and should be replaced, along with newer load centers that could be reused.

Lighting is primarily T-8 fluorescent using an Edward's EMS system with motion switches in some locations with typical switches and outlets. The building is not equipped with emergency lighting. Exit signs are present. This building does not have an emergency generator.

It should be noted that any demolition should consider the interconnection of the electrical distribution systems between buildings 7 and 8. If building 7 were to be demolished, building 8 would be affected.

Existing Distribution Board DPS

Existing panelboard, original to building

Buildings 12 & 13

The electrical system for both buildings 12 and 13 are powered from Building 14 with 400 amps of 120/208 volt, 3-phase, 4-wire power. The electrical system at building 14 is fed from a 5 KV switch providing 4160 volts to two transformers. The first is a 75 KVA transformer that delivers 400 amps of 120/208 volt, 3-phase, 4-wire power. The second is a 225 KVA transformer that provides 600 amps of 120/208 volt, 3-phase, 4-wire power for HVAC equipment in buildings 12, 13, and 14. Most of the panels are aged and are beyond there rated useful life expectancy.

The lighting for both buildings was recently upgraded to direct/indirect linear T-8 fluorescent pendant lighting using occupancy sensors with an Edward's system. The buildings are not equipped with emergency lighting or illuminated exit signs. This buildings do not have an emergency generator.

Existing panelboard, original to building

Existing panelboard, located in restroom

Buildings 35-39

The electrical system for buildings 35-39 are all powered from Building 37. The main transformer and distribution appear to be in good working condition, however, a majority of the electrical distribution equipment downstream is aged and beyond its useful life expectancy. Lighting is primarily T-8 fluorescent.

Building 35 and 36 – Math Wing Classrooms

The electrical systems for both buildings 35 and 36 are fed from Building 37 providing 120/208 volt, 3-phase, 4-wire power to mostly original distribution panelboards. The panelboards are working but are beyond their rated useful life expectancy.

The lighting was recently upgraded to a combination of recessed and pendant direct/indirect linear T-8 fluorescent fixtures using occupancy sensors. Receptacle outlets are mounted very low and do not meet current ADA requirements. The buildings are not equipped with emergency lighting or illuminated exit signs. This building does not have an emergency generator.

Newly installed lighting

Existing panelboard original to building

Building 37 – Reprographics

The electrical system at building 37 is fed from a 5 KV unit substation providing 4160 volt distribution to a 300 KVA transformer that provides 1200 amps of 120/208 volt, 3-phase, 4-wire power to buildings 35-39. The unit substation that consists of the 300kVA transformer and 208V distribution are in good working condition. The remainder of the distribution switchboards and panelboards are original to the building and are beyond their rated useful life expectancy. There are conduits that have been cut and have abandoned cabling that should be removed.

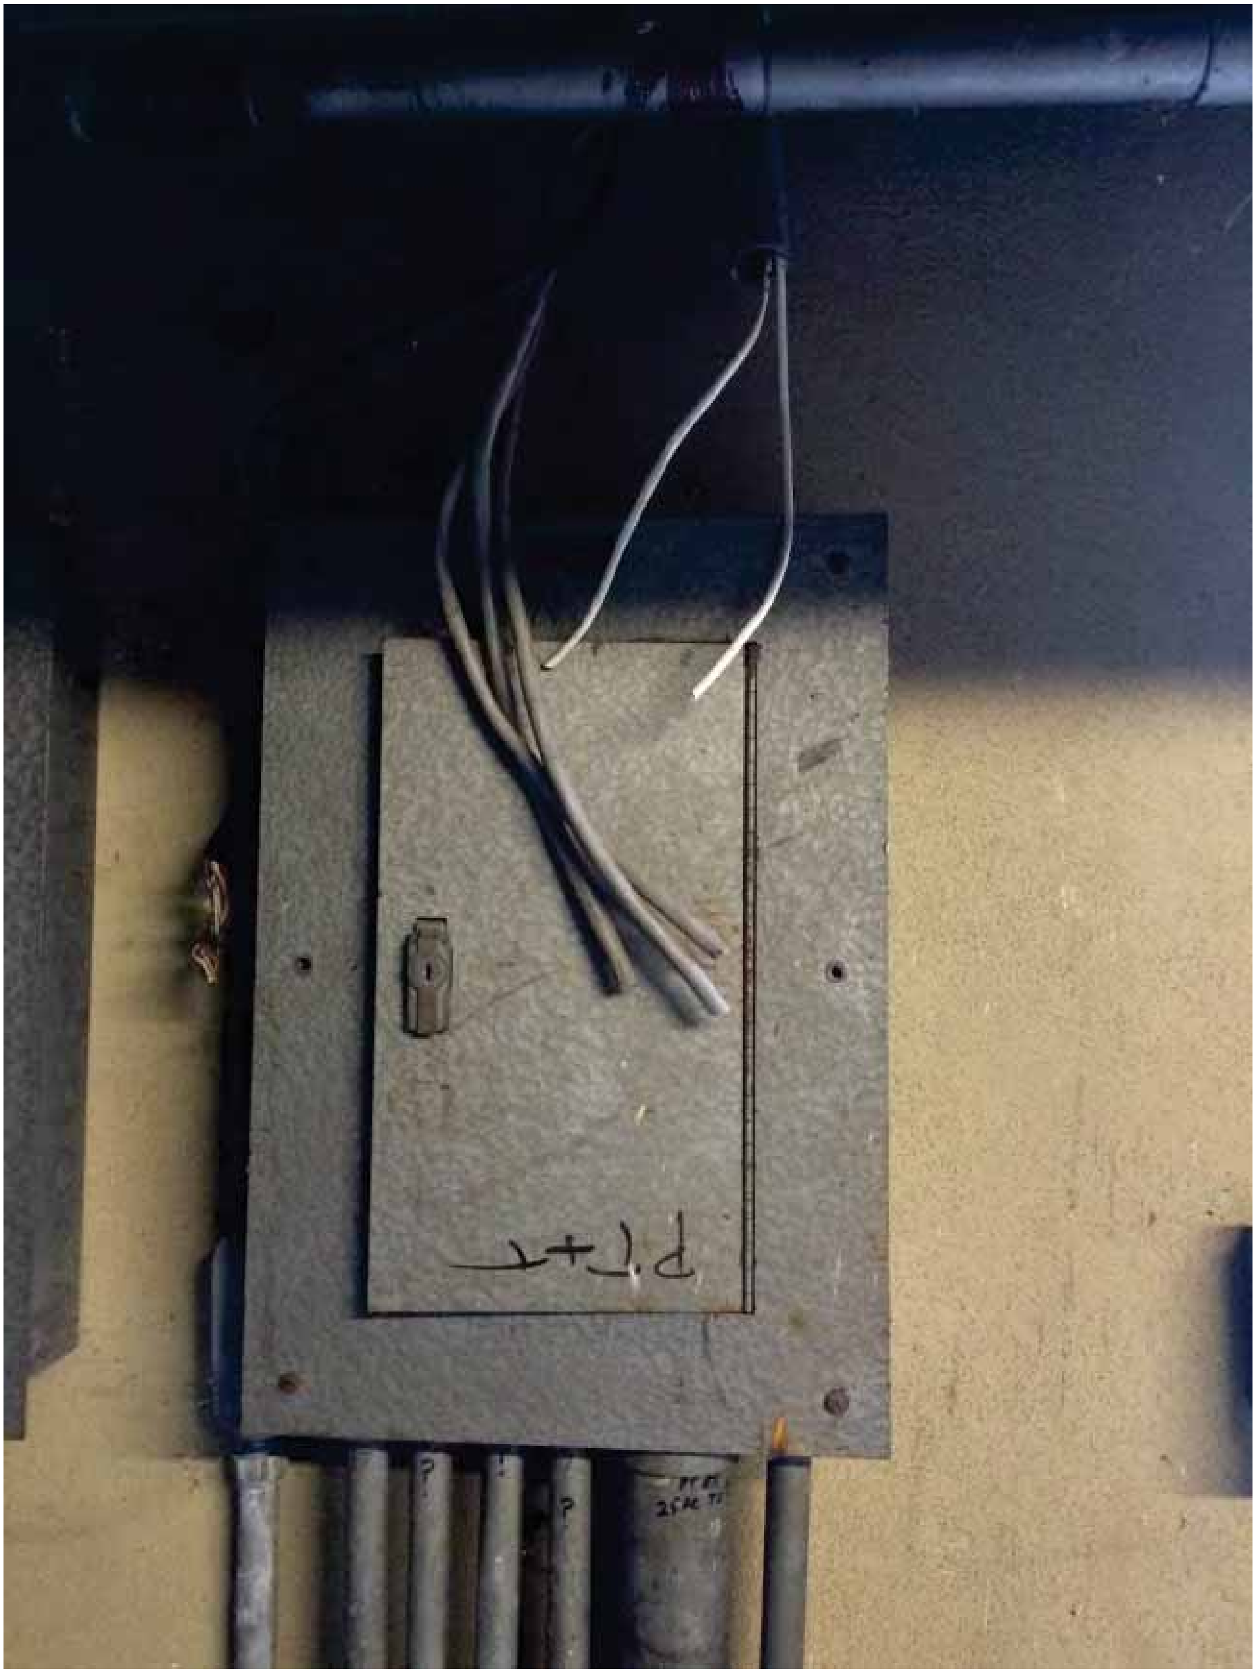
The lighting was recently upgraded to a combination of recessed and pendant direct/indirect linear T-8 fluorescent fixtures using occupancy sensors. Receptacle outlets are mounted very low and do not meet current ADA requirements. There are various light switches that are mounted at peculiar heights. The buildings are not equipped with emergency lighting or illuminated exit signs. This building does not have an emergency generator.

Existing light switches

Existing panelboard original to building

Existing unit substation

Existing distribution board DB1 and panelboard F original to building



Existing panelboard original to building and abandoned cabling

Building 38 – Science Office Annex

The offices are fed from Building 37, unidentified panelboard providing 120/208 volt, 3-phase, 4-wire power. There were no panels found within the offices and the exact source panelboard could not be found.

Lighting is primarily T-8 fluorescent surface wraps with typical switches and outlets. The building is not equipped with emergency lighting or any type of lighting controls.

Building 39 – Planetarium and Science Building

The electrical system is fed from Building 37 providing 120/208 volt, 3-phase, 4-wire power.
The existing panelboards are aged and are beyond there rated useful life expectancy. There is a device at the exterior patio area that has come unattached from the ceiling. The exterior fused disconnect at the existing HVAC unit is deteriorating.

Lighting is a combination of T-8 fluorescents, incandescent and compact fluorescents, using typical switches and outlets. The building has wall mounted battery powered emergency lighting units which appear to be operational. Exit signs are present, however, they appear to be self illuminated type that are not operating properly and are beyond there rated useful life expectancy. Receptacle outlets are mounted very low and do not meet current ADA requirements.

Existing fused disconnect

Existing device at ceiling

Existing panelboard original to building and load center mounted below

Existing lighting in planetarium soffit

Existing aged self illuminated exit sign

Buildings 93, 105 and 110

Building 93 – Pool Stadium

The existing switchgear including 4160V transformers and distribution that feed a majority of the gym complex are located below the pool stadium bleachers which consists of two 5.5 KV 200 amp switches providing 4160 volt power to two Transformers. A 225 KVA transformer 'T6A' provides 400 amps of 480/277 volt, 3-phase, 4-wire power. A 300 KVA transformer 'T6' provides 800 amps of 120/208 volt 3-phase 4-wire power to 1970s vintage local distribution panels. Both transormers appear to be in good working condition, however, the electrical panels and disconnects show signs of corrosion and should be replaced.

Existing electrical equipment and panelboard showing signs of corrosion

Building 105 & 110 –Stadium and Field House

The Field House electrical system is fed from Powerhouse "C" with 120/240 volt, 1-phase, 3-wire power to original local distribution. The existing panelboards A, B and C have recently been replaced and are in good working condition.

Lighting in the field house is provided by T-8 fluorescent using typical switches and outlets. The building is not equipped with emergency lighting or illuminated exit signs. This building does not have a noted emergency generator.

The Stadium lights are powered from a recently installed 750kVA unit substation through 480V distribution, located in an exterior yard south east of the stadium. The unit substation and associated 480V distribution equipment is in good working condition.

The panelboards within the score booths are original to the buildings and are beyond their rated useful life expectancy.

Existing panelboard at score booth

Existing 750kVA substation at exterior yard

Attention: Drew Gorski

Subject: Orange Coast College Historic Structures Assessment Report
Our Proposal #: 14-411

Drew Gorski

This letter is in regard to potential options for the Mechanical and Electrical scope of work for the buildings that are currently under review for re-use.

Mechanical

Buildings 7,8,9

- Building 7 is currently being served by an existing 4 Pipe system that will need to be replaced. The existing capacity of the central plant portion is approximately 60 Tons. This system is currently located within building 7 and is an area that is currently shown to be removed. A new central plant would need to be built out with all new equipment.
- Building 8 and 9 are currently being served by rooftop package units that range from 3 – 5 ton units. It is the goal to remove these units from the current location and replace them with an alternate HVAC solution.

Buildings 12,13,14

- These buildings are currently being served by rooftop package units that range from 3 – 5 ton units. It is the goal to remove these units from the current location and replace them with an alternate HVAC solution.

Buildings 35,36,37

- These buildings are currently being served by rooftop package units that range from 3 – 5 ton units. It is the goal to remove these units from the current location and replace them with an alternate HVAC solution.

Mechanical Options

- Option #1 – Utilize a central plant with chilled and hot water piping distributed to the buildings. For the buildings in question, a centralized plant could be utilized to serve all buildings. This would require piping being distributed underground to all buildings. It is estimated that the plant size would be approximately 150 Tons for the cooling, 1,500,000 BTU/H for heating.

- Classroom ventilation tied to central plant options
  - o Fan coil ducted within the classroom. Fan coil would be located above a dropped T-Bar ceiling to conceal equipment and piping.
  - o Chilled beam units with OSA ducted to each unit. Chilled beam would provide increased energy efficiency as well as occupy less area within the ceiling to maintain ceiling heights. Each classroom however would require 6 to 8 chilled beam units.
- Option #2 – Utilize a VRF (Variable Refrigerant) system. This would require a single location for a condenser farm to be utilized per building and refrigerant piping routed to each fan coil within the building. These condensing units can be located on the roof or on the ground within an enclosure.
- Approximate Sizes per building
  - o Building 7 – 30 Tons
  - o Building 8 – 20 Tons
  - o Building 9 – 20 Tons
  - o Building 12 – 12 Tons
  - o Building 13 – 20 Tons
  - o Building 14 – 5 Tons
  - o Building 35 – 16 Tons
  - o Building 36 – 20 Tons
  - o Building 37 – 20 Tons
- Classroom Ventilation Options
  - o Fan coil ducted within the classroom. Fan coil would be located above a dropped T-Bar ceiling to conceal equipment and refrigerant piping.
  - o Ceiling Cassettes with OSA ducted to each unit. Each classroom however would require 4-6 ceiling cassettes.

Electrical

Buildings 7,8,9

- The existing main 1600A electrical gear and transformer at the service building could remain and could be modified to serve all 3 buildings. An allowance for a new 4160V 500kVA transformer and 1600A distribution board should be included for cost estimating
- Each building would need a main distribution panel, based on square footage and use the following service sizes and electrical rooms would be required
  - o Bldg 9 - 400A 120/208V 3ph – an approximate 5'x8' electrical room
  - o Bldg 8 - 400A 120/208V 3ph – an approximate 5'x8' electrical room
  - o Bldg 7 - 600A 120/208V 3ph – an approximate 5'x8' electrical room
- Each building should have a dedicated 4'x6' room for Data/IT to include IDF, security panels, and low voltage equipment

Buildings 12,13,14

- A new transformer and main electrical gear should be installed to serve all 3 buildings. . An allowance for a new 4160V 500kVA transformer and 1600A distribution board should be included for cost estimating. This would be housed in a new 10' x 16' room or outdoor space.
- Each building would need a main distribution panel, based on square footage and use the following service sizes and electrical rooms would be required
  - Bldg 14 - 200A 120/208V 3ph– This could be housed in the same room as main service/transformer, or a 4' x 6' electrical room
  - Bldg 13 - 400A 120/208V 3ph– an approximate 5'x8' electrical room
  - Bldg 12 - 600A 120/208V 3ph– an approximate 5'x8' electrical room
- Each building should have a dedicated 4'x6' room for Data/IT to include IDF, security panels, and low voltage equipment

Buildings 35,36,37

- Based on the proposed layout, the existing electrical room at bldg 37 would become new restrooms. A new transformer and main electrical gear should be installed to serve all 3 buildings. An allowance for a new 4160V 500kVA transformer and 1600A distribution board should be included for cost estimating. This would be housed in a new 10' x 16' room or outdoor space.
- Each building would need a main distribution panel, based on square footage and use the following service sizes and electrical rooms would be required
  - Bldg 37 - 600A 120/208V 3ph– an approximate 5'x8' electrical room
  - Bldg 36 - 400A 120/208V 3ph– an approximate 5'x8' electrical room
  - Bldg 35 - 400A 120/208V 3ph– an approximate 5'x8' electrical room
- Each building should have a dedicated 4'x6' room for Data/IT to include IDF, security panels, and low voltage equipment

The above electrical sizes include package units or VRF options. Depending on central plant option, additional power may be required to support new chillers and HVAC central plant equipment.

Should you have any questions or need additional information, please feel free to contact Design West Engineering at your earliest convenience.

Respectfully,

Steven Johnson
Design West Engineering

ORANGE COAST COLLEGE HISTORICAL STRUCTURES REPORT FOR FIRE AND LIFE SAFETY SYSTEMS

Prepared For

Page & Turnbull
417 South Hill Street
Suite 211
Los Angeles, CA 90013

April 3, 2015

1YOK65334

TABLE OF CONTENTS

1. INTRODUCTION

JENSEN HUGHES has prepared this Historic Structures Report (HSR) for Orange Coast College (OCC) located at 2701 Fairview Road in Costa Mesa, California to assess the conditions of the existing fire protection systems as well as life safety features for the buildings identified to have historic significance. This report is based on the site visit performed by JENSEN HUGHES on January 13th and 14th, 2015. The site visits included visual examinations of the fire protection systems and life safety features of the facilities. No system testing or intrusive inspections were conducted by JENSEN HUGHES personnel.

2. FACILITY DESCRIPTION

OCC is located on 164 acres in Costa Mesa, CA. The campus was founded in 1947 and classes started in the Fall of 1948. This report focuses on the 16 buildings that are part of the historic structures survey. The buildings were constructed between 1950 and 1956. Renovations were done to the some of the buildings in the 1960's, 1970's, 1990's and 2000's. Table 1 shows the information of the buildings that are identified as buildings with historical significance were part of this survey.

Table 1 – Historic Structure Survey Buildings

Building Number	Building Name	Square Feet	Year Built	Year Renovated
2	Auditorium	36,566	1954	1993
4	Music	12,541	1954	2013
7	Student Success Center	13,350	1950	1999
8	Classroom and Labs	5,243	1950	1970
9	Classroom and Labs	5,430	1950	1970
12	Business Education	6,671	1953	2000
13	Business Education	4,617	1953	NR
14	Business Education	8,169	1953	1977
35	Math Wing	6,402	1956	1960
36	Math Wing	10,716	1956	1960
37	Reprographics	6,878	1956	1960
38	Science	600	1956	1960
39	Science	2,380	1956	1960
93	Pool Stadium			
105	Stadium			
110	Field House	9,010	1955	NR

Note: Areas that are blank indicate the information is not known.
NR means, based off of known information, the building has not been renovated.

3. APPLICABLE CODES

The buildings were reviewed for compliance with the current codes. The codes used are as follows,

- California Building Code (CBC), 2013 Edition
- California Fire Code (CFC), 2013 Edition
- California Historical Building Code (CHBC), 2013 Edition
- NFPA 13 *Standard for the Installation of Sprinkler Systems*, 2013 Edition
- NFPA 72 *National Fire Alarm and Signaling Code*, 2013 Edition

4. CODE REQUIREMENTS

4.1. Means of Egress

Typical means of egress from the office buildings is provided through corridors, whereas the classrooms lead directly to the outside. The auditoriums have a number of exits on the perimeter of the seating area and stage. The occupancies for the buildings are primarily Assembly (A) and Business (B), with the accessory Storage (S) occupancy. OCC, being a Higher Education institute, the classrooms will be classified as B occupancy. However, the classroom area occupant load factor would still be used to determine the occupant load of the classrooms based on the actual usage of the space.

The occupant load for Assembly areas with fixed seating is determined by the number of fixed seats per Section 1004.4 of the CBC. The occupant load factors based on California Building Code (CBC) Table 1004.1.2 for spaces with assembly (no fixed seating), business, educational and storage functions are listed in the table below.

Function of Space		**Occupant Load Factor (Sq. Ft. per occupant)**
Assembly	Concentrated (chairs only)	7 net
	Standing space	5 net
	Unconcentrated (tables and chairs)	15 net
Business	Office	100 gross
Educational	Classroom area	20 net
	Shops and other vocational room areas	50 net

In areas with A and B occupancies the maximum occupant load that can be served by one exit for A and B occupancies is 49 persons (Table 1015.1 CBC), whereas for S occupancy is 29. Using the classroom area occupant load factor, any classroom over 980 sq. ft. is required to have two exits. Any room with an occupant load factor between 501 and 1,000 is required to have three exits. Four or more exits are required when the occupant load exceeds 1,000 persons.

4.2. Fire Protection Systems

The following section covers the code requirements based on occupancy type as relates to the conditions of the buildings surveyed. These requirements are based off of the codes listed in Section 3 of this report.

OCCUPANCY	FIRE SPRINKLER	FIRE ALARM	FIRE HOSE REEL (STANDPIPE)
Assembly (A-1)	Required when the total area exceeds 12,000 sq. ft. or total occupant load exceeds 300 (CBC Section 903.2.1.1).	Manual fire alarm system is required when the occupant load exceeds 300 with emergency voice/alarm communication system required when occupant load exceeds 1,000 (CBC Section 907.2.1)	Not required except the Auditorium stage. Class III wet standpipes are required for stages greater than 1,000 sq. ft. When the building is fully sprinklered, the standpipe is required to be provided with 1½" connections and sufficient lengths of hose to cover the entire stage. (CBC Section 905.3.4)
Business	Not required unless the total floor area of building exceeds 15,000 sq. ft. for one-story building or 9,000 sq. ft. for Type V-B multistory building (CHBC Section 8-302.4 & CBC Chapter 5)	Manual fire alarm system is required when the occupant load of all floors exceeds 500 or occupant load for the floor below or above the floor of exit discharge.	Not Required.

5. BUILDING 2 – AUDITORIUM

Building 2 (Auditorium) was built in 1954 and then renovated in 1993. The building is 36,566 square feet. Building 2 has an occupancy of A-1 and B.

5.1. Means of Egress

Exiting from Building 2 is provided by multiple exits. The exiting appears to be compliant with the applicable codes. All rooms with Business (B) or Assembly (A) occupancy that have an occupant load over 49 persons have two or more exits provided as required by Table 1015.1 of the CBC.

It is possible that Room 109 (Drama Lab) may require a third exit from the room. Currently the room is provided with two exits. The third exit is dependent on the use of the room. The occupant load will exceed 500 if the room is classified as an Assembly Occupancy without fixed seats and a third exit will be required per Section 1015.1.1

of the CBCCBC. More information about the use of the room would be required to determine the correct usage and occupant load factor for the room.

Illuminated exit signage is provided throughout the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes. All ceiling-level exit signs are directional (where required) and externally illuminated. It was noted during the site visit that the exit signs in the Drama Room were not illuminated. These signs will need to be replaced.

The door going from the Drama Corridor into room Drama 101 and 102 is a 20-minute rated fire door. The door frame is a 90-minute rated frame. Since the building is protected with automatic sprinkler system throughout, the corridor is not required to be rated per Table 1018.1 of the CBC. It should also be noted that the door frame tag has been tampered with and now the tag shows “VOID” on it. This frame should be replaced in order to maintain any fire rating that might be in the corridor.

5.2. Fire Alarm System

Building 2 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel’s last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located on the second level of the Auditorium in the mechanical room. Smoke detection is provided above the fire alarm control panel.

The fire alarm system for Building 2 monitors all building initiation devices. The fire alarm system includes manual (fire alarm boxes) and automatic (smoke detection, sprinkler waterflow switches, tamper switches, and heat detectors) initiation devices and audible (horn) and visual appliances (strobes).

5.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES’S visit.

5.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in select locations. These should be provided on the interior of the building located within 5 ft. to each exit door.

System smoke detection in provided throughout the building.

5.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

5.3. Fire Sprinkler Systems

5.3.1. General Configuration

The building is provided with full automatic wet-pipe sprinkler system protection throughout the entire building. It is unknown when the fire sprinkler system was first installed in the building. It is possible that the sprinkler system was installed during the original construction of the building.

The fire sprinkler system is supplied by a single riser located on the second floor of the building near the projector room. The room that the riser is located in contains storage of costumes for performances. The riser is monitored by a waterflow switch which is connected to the fire alarm panel.

There was a Fire Department Connection (FDC) found on the outside of the building. It is unclear if this FDC is connected to the fire sprinkler system. There was no signage provided on the FDC and the caps were bolted on. It appears that the FDC is no longer in use, but this could not be confirmed.

It does not appear that there is adequate seismic bracing of the system throughout the building. The riser also has no seismic bracing provided at the top. It is recommended that seismic bracing be added to the top of the riser and throughout the building.

5.3.2. Fire Sprinklers

There were no spare sprinklers provided near the fire sprinkler riser. During the visit JENSEN HUGHES was unable to locate any spare sprinkler heads anywhere in the building. It is recommended that a spare sprinkler head cabinet be provided near the fire sprinkler riser.

The sprinklers installed in the building are Star Pendent Spray Sprinklers Model-E. From the sprinklers that were able to be viewed, they appeared to be manufactured in 1974. These sprinklers are approximately 40 years old since the manufacture date. When the sprinklers become 50 years old, a sample of sprinklers will need to be removed and sent out for testing.

The sprinklers installed in the mechanical areas of the building appear to be Grinnell F-950 fire sprinklers. The Grinnell F-950 sprinklers manufactured in 1975 and between 1978 and 1982 have had a high number of premature operations. The high number of premature operations typically indicates manufacturing defects. At the time of Jensen Hughes visit, we were unable to read the date of manufacture on the sprinkler heads. A Safety and Health Hazards Alert for the Grinnell F-950 fire sprinkler heads is provided in Appendix B.

5.4. Fire Extinguisher

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

It should be noted that the fire extinguisher located in the projector room on the second level was not inspected on January 6, 2015. The tag shows a date in January 2014. It appears this fire extinguisher was missed during the latest inspection.

5.5. Fire Hose Reels

Fire hose reels are installed in the building with 1-½ -inch hose valves. Water is supplied to the hose reels via the domestic water supply. The fire hose reels can be removed from the building, with permission from the AHJ. The only areas of the building required to have the hose reels are the stage areas. If the hose reels are to remain, then they should be fed from a dedicated fire water supply.

5.6. Building 2 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	2	Auditorium	Fire Sprinkler	No seismic bracing is provided on the fire sprinkler riser. It is recommended that seismic bracing be added to the riser.
2	2	Auditorium	Fire Sprinkler	It appeared that the seismic bracing for the sprinkler system is not adequate for the system. It is recommended that additional seismic bracing be added to the fire sprinkler

				system.
3	2	Auditorium	Fire Sprinkler	The spare fire sprinkler cabinet could not be located in the building. It is recommended that one be installed next to the riser and the required amount of sprinkler heads be placed in the cabinet.
4	2	Auditorium	Fire Sprinkler	The power/storage room (102G) on the right side of the stage does not have adequate fire sprinkler coverage. It is recommended that more fire sprinklers be added to this area to provide adequate coverage.
5	2	Auditorium	Fire Sprinkler	The status (open/closed) of the Post Indicating Valve (PIV) located near Building 2 is hard to read. Replace PIV window and text to make it easier to tell if the system is open or closed.
6	2	Auditorium	Fire Sprinkler	The Fire Department Connection (FDC) is not labeled for what buildings it serves. Add signage to the FDC to indicate what buildings are being served. If FDC is not in use a sign should be placed on the FDC indicating that it is not in use.
7	2	Auditorium	Fire Sprinkler	The FDC looks like it is bolted shut and wrench of the appropriate size would have to be used to unbolt the covers for fire department hookup. It is recommended that a new cover be installed on the FDC.
8	2	Auditorium	Fire Sprinkler	Storage in the fire sprinkler riser room is too close to the ceiling. The items being stored are closer to the sprinklers than the minimum clearance of 18 inches required by NFPA 13. This will have an effect on the spray pattern of the sprinklers in that room. Remove storage away from the sprinklers to provide a minimum clearance of 18 inches between the storage and sprinkler deflector.
9	2	Auditorium	Fire Sprinkler	Fire sprinklers are missing escutcheons on the side exits. It is recommended that the escutcheon be replaced so that the performance of the sprinkler system is not compromised.
10	2	Auditorium	Egress	Exit signs in the Drama Rooms are not illuminated. These signs will need to be replaced.
11	2	Auditorium	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.

6. BUILDING 4 – MUSIC

Building 4 (Music) was built in 1954 and renovated in 2013. The building is approximately 12,541 square feet. Building 4 is a B occupancy.

6.1. Means of Egress

All classrooms for Building 4 exit directly to the outside of the building. Classrooms with occupant load more than 49 students are provided with two exits as required by the CBC, There are two small corridors located in the building that provide access to practice rooms for the students. These hallways have two means of egress from the building that lead directly to the outside.

Illuminated exit signage is provided throughout the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes. All ceiling-level exit signs are externally illuminated.

6.2. Fire Alarm System

Building 4 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel's last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located in the electrical room. Smoke detection is provided above the fire alarm control panel.

The fire alarm system for Building 4 monitors all building initiation devices. The fire alarm system includes manual (fire alarm boxes) initiation devices and audible (horn) and visual appliances (strobes).

6.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES's visit.

6.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in one location. The fire alarm boxes were also installed next to each exit leading to the outside of the building.

6.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

6.3. Fire Sprinkler System

There is no fire sprinkler system installed in Building 4. A fire sprinkler system is not required.

6.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

6.5. Fire Hose Reels

Fire hose reels with 1-½ -inch hose valves are installed in the building. Water is supplied to the hose reels via the domestic water supply. The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

6.6. Building 4 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	4	Music	Fire Hose Reels	The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose

				reels are to remain, they should be fed from their own dedicated fire water supply.

7. BUILDING 7 – STUDENT SUCCESS CENTER

Building 7 (Student Success Center) was built in 1950 and later renovated in 1999. The building is 13,350 square feet. Building 7 is an A-1 and B occupancy.

7.1. Means of Egress

Exiting from the Student Success Center is provided by multiple exits that lead to the outside of the building. All classrooms for the Building 7 exit directly to the outside of the building. Rooms that have an occupant load over 49 persons have two or more exits provided as required by Table 1015.1 of the CBCCBC.

Illuminated exit signage is provided thought out the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes. Ceiling-level exit signs are directional (where required) and externally illuminated.

7.2. Fire Alarm System

Building 7 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel’s last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located in the utility room. Smoke detection is provided above the fire alarm control panel.

The fire alarm system in the Student Success Center monitors the fire alarm initiation devices. The fire alarm system includes manual (manual fire alarm boxes) and automatic (smoke detection, sprinkler waterflow switches, tamper switches, and heat detectors) initiation devices and audible (horns and visual appliances (strobes).

7.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES’s visit.

7.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in select locations. These should be provided on the interior of the building located next to each exit door.

System smoke detection in provided throughout the building.

7.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

Room 102 has no notification appliances.

7.3. Fire Sprinkler Systems

7.3.1. General Configuration

The building is provided with automatic wet-pipe sprinkler system protection throughout the entire building. It appears the sprinkler system was installed sometime around 1967. This is based on the date shown on the alarm check valve is shown as 1967. The exact date of installation is unknown.

The fire sprinkler system is supplied by a single riser located in its own room accessed from the outside of the building. The riser is monitored by a waterflow switch which is connected to the fire alarm panel.

There was a Fire Department Connection (FDC) found on the outside of the building. It is unclear if this FDC is connected to the fire sprinkler system. There was no signage provided on the FDC and the caps were bolted on. It appears that the FDC is no longer in use, but this could not be confirmed.

7.3.2. Fire Sprinklers

There were six spare sprinklers provided near the fire sprinkler riser. The spare sprinklers provided do not match what is installed in the building. Three of the spare sprinklers are a newer model of sprinklers and would be a suitable replacement for the older sprinkler heads installed in the building. The other three spare sprinkler heads are Grinnell F-950 fire sprinklers. The Grinnell F-950 sprinklers manufactured in 1975 and between 1978 and 1982 have had a high number of premature operations. The high number of premature operations typically indicates manufacturing defects. A Safety and Health Hazards Alert for the Grinnell F-950 fire sprinkler heads is provided in Appendix B. The Grinnell F-950 spare sprinkler heads provided in the spare head cabinet had a manufacture date of 1986. Although, the F-950 sprinkler heads in the spare cabinet don't match any years with reported problems, it is recommended that the spare heads be removed and replaced with sprinklers matching the sprinklers installed in the building.

The sprinklers installed in the building are Globe Pendent Spray Sprinklers and the Reliable R1725. Information obtained from the spare fire sprinklers is listed in Table 2 below.

Table 2 – Building 7 Student Success Center Spare Fire Sprinklers

Manufacture	Model	Temp (°F)	Year Manufactured	Type
Grinnell	F950	155	1986	Pendent
Reliable	R1725	155	2005	Pendent

7.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

7.5. Fire Hose Reels

Fire hose reels with 1-½ -inch hose valves are installed in the building. Water is supplied to the hose reels via the domestic water supply. The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

7.6. Building 7 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	7	Student Success Center	Fire Sprinkler	The spare fire sprinklers do not match the currently installed sprinklers in the building. It is recommended that the spare sprinklers be changed out to include the sprinklers that are installed in the building. If the sprinklers installed in the building are no longer available a newer sprinkler head with the similar characteristics should be used.
2	7	Student Success Center	Fire Sprinkler	The ceiling tiles in many locations appear to have some sort of damage leaving gaps around sprinkler escutcheons. These tiles need to be replaced to ensure proper sprinkler coverage.
3	7	Student Success Center	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building. Manual fire alarm boxes should be provided on the interior of the building located within 5 ft. of each exit door.
4	7	Student Success Center	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

8. BUILDING 8 – CLASSROOM AND LABS

Building 8 (Classroom and Labs) was built in 1950 and renovated in 1970. The building is approximately 5,243 square feet. Building 8 is an B occupancy.

8.1. Means of Egress

Classrooms for Building 8 exit directly to the outside of the building. Rooms that have an occupant load over 49 persons have two or more exits provided as required by Table 1015.1 of the CBC.

Illuminated exit signage is provided thought out the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes.

8.2. Fire Alarm System

Building 8 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel's last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located in the utility room located in Building 7. Smoke detection is provided above the fire alarm control panel.

The fire alarm system for Building 8 monitors the fire alarm initiation devices. The fire alarm system includes manual (fire alarm boxes) initiation devices and audible (horn) and visual appliances (strobes).

8.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES's visit.

8.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in one location. These should be provided on the interior of the building located within 5 ft. of each exit door.

There is no smoke or heat detection provided in the building.

8.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

8.3. Fire Sprinkler System

There is no fire sprinkler system installed in Building 8. Building 8 is not required to have a fire sprinkler system.

8.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

8.5. Fire Hose Reels

Fire hose reels with 1-½ -inch hose valves are installed in the building. Water is supplied to the hose reels via the domestic water supply. The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

8.6. Building 8 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	8	Classrooms and Labs	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building. Manual fire alarm boxes should be provided on the interior of the building located next to each exit door.
2	8	Classrooms and Labs	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

9. BUILDING 9 – CLASSROOM AND LABS

Building 9 (Classroom and Labs) was built in 1950 and renovated in 1970. The building is approximately 5,430 square feet. Building 9 is an B occupancy.

9.1. Means of Egress

Classrooms for Building 9 exit directly to the outside of the building. Rooms that have an occupant load over 49 persons have two or more exits provided as required by Table 1015.1 of the CBCCBC.

Illuminated exit signage is provided thought out the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes.

9.2. Fire Alarm System

Building 9 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel's last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located in the electrical room in the Fine Arts Building (Building 5). Smoke detection is provided above the fire alarm control panel.

The fire alarm system for Building 9 monitors all building initiation devices. The fire alarm system includes manual (fire alarm boxes) and automatic (smoke and heat detection) initiation devices and audible (horn) and visual appliances (strobes).

9.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES's visit.

9.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in one location. These should be provided on the interior of the building located within 5 ft. of each exit door.

Rooms 111 and 112 have no smoke or heat detection. Rooms 113 and 114 have smoke and heat detection.

9.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

9.3. Fire Sprinkler System

There is no fire sprinkler system installed in Building 9. Building 9 is not required to have a fire sprinkler system.

9.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

9.5. Fire Hose Reels

Fire hose reels with 1-½ -inch hose valves are installed in the building. Water is supplied to the hose reels via the domestic water supply. The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

9.6. Building 9 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	9	Classrooms and Labs	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building. Manual fire alarm boxes should be provided on the interior of the building located next to each exit door.

2	9	Classrooms and Labs	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

10. BUILDING 12 – BUSINESS EDUCATION

Building 12 (Business Education) was built in 1953 and renovated in 2000. The building is approximately 6,671 square feet. Building 12 is of B occupancy.

10.1. Means of Egress

Classrooms for Building 12 exit directly to the outside of the building. Rooms that have an occupant load over 49 persons have two or more exits provided as required by Table 1015.1 of the CBC.

Illuminated exit signage is provided thought out the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes.

10.2. Fire Alarm System

Building 12 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel’s last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located in the telephone equipment room in Building 14. Smoke detection is provided above the fire alarm control panel.

The fire alarm system for Building 12 monitors all building initiation devices. The fire alarm system includes manual (fire alarm boxes) initiation devices and audible (horn) and visual appliances (strobes).

10.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES’s visit.

10.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in one location. These should be provided on the interior of the building located within 5 ft. of each exit door.

No rooms in Building 12 have any automatic initiation devices.

10.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

10.3. Fire Sprinkler System

There is no fire sprinkler system installed in Building 12. Fire sprinklers for Building 12 are not required.

10.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

10.5. Fire Hose Reels

Fire hose reels with 1-½ -inch hose valves are installed in the building. Water is supplied to the hose reels via the domestic water supply. The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

10.6. Building 12 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	12	Business Education	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building near all exit doors.
2	12	Business Education	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

11. BUILDING 13 – BUSINESS EDUCATION

Building 13 (Business Education) was built in 1953 and has not been renovated. The building is approximately 4,617 square feet. Building 13 is of B occupancy.

11.1. Means of Egress

Classrooms for Building 13 exit directly to the outside of the building. All rooms, except for Room 106, that have an occupant load over 49 persons have two or more exits provided as required by Table 1015.1 of the CBC. Room 106 has an area of 1,208 sq. ft. Using an occupant load factor of 20 sq. ft. per person, the room has an occupant load of 61 persons. Room 106 exceeds the limit 49 persons for one exit, and is required to have two exits.

Illuminated exit signage is provided thought out the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes.

11.2. Fire Alarm System

Building 13 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel’s last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located in the telephone equipment room located in Building 14. Smoke detection is provided above the fire alarm control panel.

The fire alarm system for Building 13 monitors all building initiation devices. The fire alarm system includes manual (fire alarm boxes) initiation devices and audible (horns) and visual appliances (strobes).

11.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES's visit.

11.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in one location. Manual fire alarm boxes should be provided on the interior of the building located within 5 ft. of each exit door.

No rooms in Building 13 have any automatic initiation devices.

11.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

11.3. Fire Sprinkler System

There is no fire sprinkler system installed in Building 13. A fire sprinkler system for Building 13 is not required.

11.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

11.5. Fire Hose Reels

Fire hose reels with 1-½ -inch hose valves are installed in the building. Water is supplied to the hose reels via the domestic water supply. The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

11.6. Building 13 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	13	Business Education	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building within 5 ft. of all exit doors.
2	13	Business Education	Fire Alarm	In room 105 a 30cd strobe is installed in the room. A 30cd strobe can cover a room that is 28 x 28 feet in accordance with NFPA 72. The room measures to be 20'8" by 34'2". The strobe needs to be replaced with a higher candela rating to provide adequate strobe coverage.
3	13	Business Education	Egress	Room 106 measures to be 1,208 square feet. This room is provided with only one exit. Since this room has an occupant load greater than 49, it is required to have a minimum of two exits. It is recommended that a second exit be provided for this room.

4	13	Business Education	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

12. BUILDING 14 – BUSINESS EDUCATION

Building 14 (Business Education) was built in 1953 and renovated in 1977. The building is approximately 8,169 square feet. This building was not included in the scope of work, but the fire alarm panel for Buildings 12 and 13 is located in Building 14.

12.1. Means of Egress

Classrooms for the Building 14 exit directly to the outside of the building.

Illuminated exit signage is provided thought out the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes.

12.2. Fire Alarm System

Building 14 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel’s last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located in the telephone equipment room. Smoke detection is provided above the fire alarm control panel.

The fire alarm system for Building 14 monitors all building initiation devices. The fire alarm system includes manual (fire alarm boxes) initiation devices and audible (horn) and visual appliances (strobes).

12.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES’s visit.

12.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in various locations. Manual fire alarm boxes should be provided on the interior of the building located within 5 ft. of each exit door.

No rooms in Building 14 have any automatic initiation devices.

12.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

12.3. Fire Sprinkler System

There is no fire sprinkler system installed in Building 14. Fire sprinklers for Building 14 are not required.

12.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

12.5. Fire Hose Reels

Fire hose reels with 1-½ -inch hose valves are installed in the building. Water is supplied to the hose reels via the domestic water supply. The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

12.6. Building 14 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	14	Business Education	Fire Alarm	Manual fire alarm boxes are provided on the outside of the building. Manual fire alarm boxes should be provided on the interior of the building located within 5 ft. of each exit door.
2	14	Business Education	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

13. BUILDING 35 – MATH WING

Building 35 (Math Wing) was built in 1956 and renovated in 1960. The building is approximately 6,402 square feet. Building 25 is an B occupancy.

13.1. Means of Egress

Classrooms for Building 35 exit directly to the outside of the building. Room 149 is 997 sq. ft. in size and is provided with one exit. Using an occupant factor of 20 sq. ft. per person for classrooms (CBC Table 1004.1.2), the occupant load for the room will exceed 49, thereby requiring a second exit.

Illuminated exit signage is provided thought out the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes.

13.2. Fire Alarm System

Building 35 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel's last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located in the telephone equipment room in Building 38. Smoke detection is provided above the fire alarm control panel.

The fire alarm system for Building 35 monitors all building initiation devices. The fire alarm system includes manual (fire alarm boxes) initiation devices and audible (horn) and visual appliances (strobes).

13.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES's visit.

13.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in one location. Manual fire alarm boxes should be provided on the interior of the building located within 5 ft. of each exit door.

No rooms in Building 35 have automatic initiation devices.

13.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

13.3. Fire Sprinkler System

There is no fire sprinkler system installed in Building 35. Fire sprinklers are not required in Building 35.

13.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

13.5. Fire Hose Reels

Fire hose reels with 1-½ -inch hose valves are installed in the building. Water is supplied to the hose reels via the domestic water supply. The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

13.6. Building 35 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	35	Math Wing	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building within 5 ft. of all exit doors.
2	35	Math Wing	Egress	Room 149 is 997 sq. ft. in size. Using an occupant factor of 20 sq. ft. Room 149 is 997 sq. ft. in size and is provided with one exit. Using an occupant factor of 20 sq. ft. per person for classrooms, the occupant load for the room will exceed 49, thereby requiring a second exit. It is recommended that a second exit be provided from this room.
3	35	Math Wing	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

14. BUILDING 36 – MATH WING

Building 36 (Math Wing) was built in 1956 and renovated in 1960. The building is approximately 10,716 square feet. Building 36 is an B occupancy.

14.1. Means of Egress

Classrooms for the Building 36 exit directly to the outside of the building. Rooms 141, 142, 143, 145, 146, and 148 all are over 980 sq. ft and are provided with one exit. Using an occupant factor of 20 sq. ft. per person for classrooms (CBC Table 1004.1.2), the occupant load for the room will exceed 49, thereby requiring a second exit.

Illuminated exit signage is provided thought out the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes.

14.2. Fire Alarm System

Building 36 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel's last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located in the telephone equipment room in the Building 38. Smoke detection is provided above the fire alarm control panel.

The fire alarm system for Building 36 monitors all building initiation devices. The fire alarm system includes manual (fire alarm boxes) and automatic (smoke and heat detection) initiation devices and audible (horn) and visual appliances (strobes).

14.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES's visit.

14.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in one location. These should be provided on the interior of the building located within 5 ft. of each exit door.

Only Rooms 141 and 142 in Building 35 have automatic initiation devices. The rest of the building has no automatic initiation devices.

14.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

14.3. Fire Sprinkler System

Room 142A is provided with fire sprinklers. The sprinklers in room 142A are fed from the domestic water supply. There are no other fire sprinklers installed in Building 36. Fire sprinklers are not required in Building 36. The fire sprinklers in Room 142A should be removed, or full fire sprinkler protection should be installed throughout Building 36.

14.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

14.5. Fire Hose Reels

Fire hose reels with 1-½ -inch hose valves are installed in the building. Water is supplied to the hose reels via the domestic water supply. The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

14.6. Building 36 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	36	Math Wing	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building within 5 ft. of all exit doors.
2	36	Math Wing	Egress	A brick wall keeps the 2nd exit door from opening all the way. It is recommended that the wall be removed so the exit door can open all the way. This room does require two exits.
3	36	Math Wing	Egress	Rooms 141, 142, 143, 145, 146, and 148 all are over 980 sq. ft. Using an occupant load factor of 20 sq. ft. (CBC Table 1004.1.2) all of the rooms exceed the 49 persons for a single exit and a second exit will have to be added to each room.
4	36	Math Wing	Fire Sprinkler	Fire sprinklers are not required in Building 36. The fire sprinklers in Room 142A should be removed, or full fire sprinkler protection should be installed throughout Building 36.
5	36	Math Wing	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

15. BUILDING 37 – REPROGRAPHICS

Building 37 (Reprographics) was built in 1956 and renovated in 1960. The building is approximately 6,878 square feet. Building 37 is an B occupancy.

15.1. Means of Egress

All rooms for Building 37 exit directly to the outside of the building.

Illuminated exit signage is provided thought out the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes.

15.2. Fire Alarm System

Building 37 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel's last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located in the telephone equipment room in Building 38. Smoke detection is provided above the fire alarm control panel.

The fire alarm system for Building 37 monitors all building initiation devices. The fire alarm system includes manual (fire alarm boxes) initiation devices and audible (horn) and visual appliances (strobes).

15.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES's visit.

15.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in one location. These should be provided on the interior of the building located within 5 ft. of each exit door.

No rooms in Building 37 have any automatic initiation devices.

15.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

15.3. Fire Sprinkler System

There is no fire sprinkler system installed in Building 37. Fire sprinklers are not required in Building 37.

15.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

15.5. Fire Hose Reels

Fire hose reels with 1-½ -inch hose valves are installed in the building. Water is supplied to the hose reels via the domestic water supply. The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

15.6. Building 37 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	37	Reprographics	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building within 5 ft. of all exit doors.

2	37	Reprographics	Fire Hose Reel	The fire hose reels are not required for this building, and should be removed with permission of the AHJ. If the hose reels are to remain, they should be fed from their own dedicated fire water supply.

16. BUILDING 39 – SCIENCE (PLANETARIUM)

Building 39 (Planetarium) was built in 1956 and renovated in 1960. The building is approximately 2,380 square feet. Building 39 is an B occupancy.

16.1. Means of Egress

All exits for the Building 39 exit directly to the outside of the building.

Illuminated exit signage is provided thought out the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes.

16.2. Fire Alarm System

Building 39 is provided with an Edwards EST 3 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The panel's last annual service was done by HCI on December 26, 2014.

The fire alarm panel is located in the telephone equipment room in Building 38. Smoke detection is provided above the fire alarm control panel.

The fire alarm system for Building 38 monitors all building initiation devices. The fire alarm system includes manual (fire alarm boxes) initiation devices and audible (horn) and visual appliances (strobes).

16.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES's visit.

16.2.2. Initiation Devices

Manual fire alarm boxes are provided on the outside of the building in one location. These should be provided on the interior of the building located within 5 ft. of each exit door.

Building 39 does not have any automatic initiation devices.

16.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

16.3. Fire Sprinkler System

There is no fire sprinkler system installed in Building 39. A fire sprinkler system is not required in Building 39.

16.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

16.5. Fire Hose Reels

Fire hose reels are not installed in Building 39. Hose reels are not required.

16.6. Building 39 Recommendations

Item	Building Number	Building Name	System	Recommendation
1	39	Science (Planetarium)	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building within 5 ft. of all exit doors.

17. BUILDING 93 – POOL STADIUM

The age and square footage of the Pool Stadium is not known based off of information provided to Jensen Hughes.

17.1. Means of Egress

There are two exits that lead out of the pool stadium. One located on each side of the seating area.

The stairs for the seating are 42” wide by 10¾” long by 5” high. The seating area aisle is 32” wide with the seat and 22” wide without the seat.

17.2. Fire Alarm System

There is no fire alarm system for Building 93.

17.3. Fire Sprinkler System

There is no fire sprinklers located in Building 93.

17.4. Fire Extinguishers

Fire extinguishers are located in the pump room for the pool stadium. They were last inspected on January 6, 2015 by World-Wide Fire Inc.

17.5. Fire Hose Reels

Fire hose reels are not installed in Building 93.

18. BUILDING 105 – STADIUM

The age and square footage of the Stadium is not known based off of information provided to Jensen Hughes.

18.1. Means of Egress

There are multiple exits that lead out of the stadium.

The stairs for the seating are 56.5” wide by 11.5” long by 6” high. The seating area aisle is 22” wide with the seat and 11” wide without the seat.

18.2. Fire Alarm System

Building 105 is provided with an Edwards EST 2 addressable fire alarm system. The panel reports back to the main panels located in the Administrative Office and the Maintenance and Operations Office. The fire alarm system appears to be in good condition. The panel is currently serviced under contract with HCI. The service tag from HCI is not located on the panel. It is unknown was the last annual service was performed.

The fire alarm panel is located in the press box on the home team side of the field. Smoke detection is provided above the fire alarm control panel.

The fire alarm system in Building 105 monitors all building initiation devices. The fire alarm system includes manual (fire alarm boxes) initiation devices and audible (horn) and visual appliances (strobes).

18.2.1. System Status

The fire alarm panel was in normal status at the time of JENSEN HUGHES’s visit.

18.2.2. Initiation Devices

Building 105 has smoke detection in the announcer and press rooms of the Press Box.

18.2.3. Notification Appliances

The system is reportedly installed and programmed to provide evacuation for the entire building. Audible notification appears to be provided by means of horns throughout the building. Visual notification appears to be provided by means of strobes throughout the building.

18.3. Fire Sprinkler System

There is no fire sprinkler system installed in Building 105.

18.4. Fire Extinguishers

The building is provided with fire extinguishers throughout. The fire extinguishers were last inspected on January 6, 2015 by World-Wide Fire Inc.

18.5. Fire Hose Reels

Fire hose reels are not installed in the building.

19. BUILDING 110 – FIELD HOUSE

The age and square footage of Building 110 is not known based off of information provided to Jensen Hughes.

19.1. Means of Egress

All exits for the Building 110 exit directly to the outside.

Illuminated exit signage is provided thought out the building, directing occupants to the exits. The location and installation of the exit signage appears to be compliant with the applicable codes.

19.2. Fire Alarm System

There is no fire alarm system for Building 110.

19.3. Fire Sprinkler System

There is no fire sprinkler system installed in Building 110.

19.4. Fire Extinguishers

Fire extinguishers are located throughout Building 110. They were last inspected on January 6, 2015 by World-Wide Fire Inc.

19.5. Fire Hose Reels

Fire hose reels are installed in the building. Water is supplied to the hose reels via the domestic water supply.

20. SUMMARY OF ALL BUILDING RECOMMENDATIONS

The table below shows a list of recommendations that should be addressed with each building.

Item	Building Number	Building Name	System	Recommendation
1	2	Auditorium	Fire Sprinkler	No seismic bracing is provided on the fire sprinkler riser. It is recommended that seismic bracing be added to the riser.
2	2	Auditorium	Fire Sprinkler	It appeared that the seismic bracing for the sprinkler system is not adequate for the system. It is recommended that additional seismic bracing be added to the fire sprinkler system.
3	2	Auditorium	Fire Sprinkler	The spare fire sprinkler cabinet could not be located in the building. It is recommended that one be installed next to the riser and the required amount of sprinkler heads be placed in the cabinet.
4	2	Auditorium	Fire Sprinkler	The power/storage room (102G) on the right side of the stage does not have adequate fire sprinkler coverage. It is recommended that more fire sprinkler heads be added to this area.
5	2	Auditorium	Fire Sprinkler	The Post Indicating Valve (PIV) located near Building 2 is hard to read. It does not show if the system is open or closed. Replace PIV window and text to make it easier to tell if the system is open or closed.
6	2	Auditorium	Fire Sprinkler	The Fire Department Connection (FDC) is not labeled for what buildings it serves. Add signage to the FDC to indicate what buildings are being served. If FDC is not in use a sign should be placed on the FDC indicating that it is not in use.
7	2	Auditorium	Fire Sprinkler	The FDC looks like it is bolted shut and wrench of the appropriate size would have to be used to unbolt the covers for fire department hookup. It is recommended that a new cover be installed on the FDC.
8	2	Auditorium	Fire Sprinkler	Storage in the fire sprinkler riser room is too close to the ceiling. The items being stored are closer to the sprinklers

Item	Building Number	Building Name	System	Recommendation
				than the minimum clearance of 18 inches required by NFPA 13. This will have an effect on the spray pattern of the sprinklers in that room. Remove storage away from the sprinklers to provide a minimum clearance of 18 inches between the storage and sprinkler deflector.
9	2	Auditorium	Fire Sprinkler	Fire sprinklers are missing escutcheons on the side exits. It is recommended that the escutcheon be replaced so the performance of the sprinkler system is not compromised.
10	2	Auditorium	Egress	Exit signs in the Drama Rooms are not illuminated. These signs will need to be replaced.
11	2	Auditorium	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.
12	2	Auditorium	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building. Manual fire alarm boxes should be provided on the interior of the building located within 5 ft. each exit door.
13	4	Music	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.
14	7	Student Success Center	Fire Sprinkler	The spare fire sprinklers are not what are currently installed in the building. It is recommended that the spare sprinklers be changed out to include the sprinklers that are installed in the building. If the sprinklers installed in the building are no longer available a newer sprinkler head with the same characteristics should be used.
15	7	Student Success Center	Fire Sprinkler	The ceiling tiles in many locations appear to have some sort of damage leaving gaps around sprinkler escutcheons. These tiles need to be replaced to ensure proper sprinkler coverage.
16	7	Student Success Center	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building. Manual fire alarm boxes should be provided on the interior of the building located next to each exit door.
17	7	Student Success Center	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.
18	8	Classrooms and Labs	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building. Manual fire alarm boxes should be provided on the interior of the building located within 5 ft. of each exit door.
19	8	Classrooms and Labs	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.
20	9	Classrooms and Labs	Fire Alarm	Only one manual fire alarm box is provided on the outside of the building. Manual fire alarm boxes should be provided on

Item	Building Number	Building Name	System	Recommendation
				the interior of the building located within 5 ft. of each exit door.
21	9	Classrooms and Labs	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.
22	12	Business Education	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building within 5 ft. of each exit door.
23	12	Business Education	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.
24	13	Business Education	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building within 5 ft. of each exit door.
25	13	Business Education	Fire Alarm	In room 105 a 30cd strobe is installed in the room. A 30cd strobe can cover a room that is 28 x 28 feet. The room measures to be 20’8” by 34’2”. The strobe needs to be replaced with a higher candela rating.
26	13	Business Education	Egress	Room 106 measures to be 1,208 square feet. This room is provided with only one exit. This room has an occupant load of 51 persons, so it is required to have two exits. It is recommended that an second exit be provided for this room
27	13	Business Education	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.
28	14	Business Education	Fire Alarm	Manual fire alarm boxes are provided on the outside of the building. Manual fire alarm boxes should be provided on the interior of the building located next to each exit door.
29	14	Business Education	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.
30	35	Math Wing	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building within 5 ft. of each exit door.
31	35	Math Wing	Egress	Room 149 is 997 sq. ft. in size. Using an occupant factor of 20 sq. ft. per person any room over 980 sq. ft. is required to have two exits
32	35	Math Wing	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water

Item	Building Number	Building Name	System	Recommendation
				supply.
33	36	Math Wing	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building within 5 ft. of each exit door.
34	36	Math Wing	Egress	A brick wall keeps the 2nd exit door from opening all the way. It is recommended that the wall be removed so the exit door can open all the way. This room does require two exits.
35	36	Math Wing	Egress	Rooms 141, 142, 143, 145, 146, and 148 all are over 980 sq. ft. Using an occupant load factor of 20 sq. ft. (CBC Table 1004.1.2) all of the rooms exceed the 49 persons for a single exit and a second exit will have to be added to each room.
36	36	Math Wing	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.
37	37	Reprographics	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building within 5 ft. of each exit door.
38	37	Reprographics	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.
39	39	Science (Planetarium)	Fire Alarm	Only one manual fire alarm box is installed in the building. The fire alarm box is installed on the outside of the building. It is recommended that a fire alarm box be installed on the inside of the building within 5 ft. of each exit door.
40	39	Science (Planetarium)	Fire Hose Reels	The fire hose reels can be removed from the building, except for the stage area, with the permission of the AHJ. If the hose reels are to remain, then they should be removed from the domestic water supply and fed from a dedicated fire water supply.

APPENDIX B. GRINNELL F-950 SAFETY BULLITIN

ENVIRONMENT, SAFETY & HEALTH

SAFETY & HEALTH HAZARDS ALERT

Assistant Secretary for Environment, Safety & Health • U.S. Department of Energy • Washington, D.C. 20585

DOE/EH-0518 Issue No.2001-01 August 2001

Potentially Defective Automatic Fire Sprinklers — An Update

The purpose of this notice is to provide you with an update to previously reported information of a similar nature, published by the Office of Environment, Safety and Health.[1] This notice addresses the recent automatic fire sprinkler recall issued through the Consumer Products Safety Commission (CPSC), as well as the discovery of conditions that may adversely affect satisfactory performance of certain automatic fire sprinklers. Recommended actions are included. If implemented in your facilities, these actions will help avoid the adverse consequences associated with potentially defective automatic fire sprinklers.

Image of a defective Grinnell F-950 Sprinkler

On July 19, 2001, the CPSC announced a voluntary recall of O-ring-type fire sprinklers manufactured by Central Sprinkler Company, Gem Sprinkler Company, and Star Sprinkler Inc. for installations dating as far back as the mid-1970s. A similar recall was announced for 8 million Central Omega brand sprinklers on October 14, 1999, as reported in the January 1999, Safety and Health Hazards Alert. Central Sprinkler, an affiliate of Tyco Fire Products LP of Lansdale, Pennsylvania, will provide free parts and labor to replace 35 million Central fire sprinklers with O-ring seals, as well as for a limited number of O-ring models sold by Gem Sprinkler Company and Star Sprinkler, Inc.— totaling about 167,000 sprinkler heads.

Central initiated this action because it discovered that the performance of O-ring seals can degrade over time due to either metal corrosion, minerals, salts or other contaminants of installed systems. These factors could cause sprinkler valve caps to seal shut and not activate in the event of a fire. To date, Central has received four reports of "wet" sprinklers failing to activate in a fire and nine similar reports on "dry" sprinklers.

Replacement sprinklers that do not use O-ring seals will be provided for certain types of wet sprinklers installed between 1989-2000 or for dry sprinklers installed from the mid-1970s to 2001. An identification brochure for all the models covered under this voluntary replacement program can be downloaded via the Internet at http://www.sprinklerreplacement.com/VRP/whatSprinklers/downloadID.html.

As a supplement to this recall, please review the January 1999 Safety and Health Hazards Alert addressing issues with other fire sprinkler models that have additional suspect deficiencies and which may continue to be present within your
